GENERAL CHEMISTRY

Principles and Application. By LYMAN C. NEWELL
Professor of Chemistry in Boston University.

This new book excels in directness and simplicity of presentation, in the novel grouping and arrangement of subject matter, and in the compact and luminous treatment of theory. It devotes unusual space to the chemistry of everyday life and the industries. Part I—Descriptive Text. Part II—Experiments. Complete, 580 pages, $1.20.

"The Most Interesting Magazine in the World"

HARPER'S MAGAZINE

FOR 1915

¶*HARPER'S MAGAZINE is showing to-day the largest number of subscribers in its history. The explanation of this is quite simple. HARPER'S MAGAZINE makes permanent friends among its readers because it is edited for them—simply and solely for the purpose of interesting them.*

¶*HARPER'S MAGAZINE has personality—and good manners. It is not only the most interesting magazine in the world, but the most interestingly arranged and the most expensively made. It is the most beautiful, for no limit is ever placed on the cost. It is the sort of guest you are glad to welcome in your home.*

¶*It is impossible to give any complete outline of next year's plans at this time, but here are a few notable features already arranged.*

A Remarkable Unpublished Romance by MARK TWAIN

A NEW romance by Mark Twain has just been brought to light—a remarkable story called "The Mysterious Stranger." It is unquestionably the most important and characteristic work of the great humorist's later life—a story of the supernatural, full of deep spiritual significance. It will appear serially in HARPER'S MAGAZINE, the only magazine which has the privilege of publishing Mark Twain's work.

A Great Novel of American Life by BASIL KING *Author of "The Inner Shrine"*

FOLLOWING Booth Tarkington's great serial which is now appearing will come the most important novel that the author of "The Inner Shrine" has yet written. It is absolutely American in its atmosphere—a love story of rare humor and charm.

LINCOLN AS JOHN HAY KNEW HIM

JOHN HAY kept a careful diary during the entire period when he was Abraham Lincoln's secretary and later through his career as a diplomat and statesman. In this diary, which has never before been given to the public, he gives a delightfully intimate, day-by-day picture of Lincoln in war-time. He also presents some astonishing facts in regard to certain leaders in the war in their relation to Lincoln. William Roscoe Thayer, the historian, has selected from his diary the most notable portions for publication in HARPER'S MAGAZINE. Other important contributions in the field of history will be a remarkable article by Prof. Albert Bushnell Hart on "American Historical Liars" and some new Napoleon material of unusual importance.

TRAVEL IN MANY LANDS

IN these days when travel in foreign lands is both difficult and dangerous, readers of HARPER'S MAGAZINE may journey in comfort to almost every interesting corner of the world through the MAGAZINE'S brilliantly written and elaborately illustrated travel articles. These articles are not the conventional descriptions of foreign travel—you can find plenty of those in the guide-books. HARPER'S travel articles have personality. They bring up before you vivid, unforgettable pictures of strange and beautiful places in far-distant lands as seen through the eyes of world-famous writers and explorers.

THE FIELD OF SCIENCE

IN this field the position of HARPER'S MAGAZINE is unique. It is the one non-technical magazine for which the great savants of England, Europe, and America are willing to write. The new year promises some astonishing revelations.

THE DIALOGUES OF A DIPLOMAT

NO feature published of recent years in HARPER'S MAGAZINE has attracted more attention than the two "diplomatic dialogues" by Hon. David Jayne Hill, formerly U. S. Ambassador at Berlin. Mr. Hill is now at work on some more of these dialogues dealing with certain vital American problems.

MASTERLY SHORT STORIES

IN HARPER'S MAGAZINE great importance has always been given to the short story, and the stories in HARPER'S deserve the importance given them. HARPER'S publishes more short stories—and better—than any other illustrated magazine in the English language. There are at least seven complete short stories in every number. They represent the best work of every leading writer of England and America—indeed, of the world.

HARPER & BROTHERS, FRANKLIN SQUARE, NEW YORK, N. Y.

BOOKS OF PERMANENT VALUE

CALIFORNIA
Romantic and Beautiful
By GEORGE WHARTON JAMES

A history of California's old missions and of its Indians; a survey of its climate, topography, deserts, mountains, rivers, valleys, islands, and coast line; a description of its recreations and festivals; a review of its industries; an account of its influence upon prophets, poets, artists, and architects; and some reference to what it offers of delight to the automobilist, traveller, sportsman and health seeker. Unquestionably this will be the holiday book of the year. *With a map and seventy-two plates, of which eight are in color. Boxed, net,* $3.50; *carriage paid,* $3.70.

BULGARIA AND HER PEOPLE
Including an account of Bulgaria's relations with Servia and Montenegro.

By PROF. WILL S. MONROE
Author of "Bohemia and the Cechs."

"In these days of European war the reader can find much that is of thrilling interest from the calmly written facts relating to the late Balkan War, and its more or less close connection with the great conflict that is now before us. This concise and graphic history of a people who have known little of life's pleasures but always plenty of the hardships, is written with a dignity befitting the subject."—*Travel. Handsomely illustrated, boxed, net,* $3.00; *carriage paid,* $3.25.

ON OLD WORLD HIGHWAYS
By THOMAS D. MURPHY
Author of "British Highways and Byways from a Motor Car," etc.

A book of motor rambles in France and Germany and the record of a motor pilgrimage from Land's End to John O' Groats in Great Britain.

"Mr. Murphy's style is charming, his information varied, his knowledge of things classic and picturesque, broad and scholarly."—*New York Sun. Illustrated with sixteen full page plates in color and forty in duogravure. Boxed, net,* $3.00; *carriage paid,* $3.20.

SYLVIA'S EXPERIMENT
THE CHEERFUL BOOK
Trade Mark
By MARGARET R. PIPER
Third Printing.

"The CHEERFUL Book should be read by the exponents of POLLYANNA, THE GLAD BOOK," so says Mr. H. V. Meyer, Mgr. American Baptist Pub. Soc., Boston. *Net,* $1.25; *carriage paid,* $1.40.

From Page's List
WORTH WHILE NEW FICTION

ANNE OF THE BLOSSOM SHOP
A Sequel to "The Blossom Shop"
By ISLA MAY MULLINS

"A rare and gracious picture of the unfolding of life for the young girl, told with a delicate sympathy and understanding that must touch the hearts of young and old alike."—*Louisville Times.*

PLANTATION STORIES OF OLD LOUISIANA
By ANDREWS WILKINSON
(*Third Printing.*)

"Grownups can read it with intense interest because running through the stories is a vein of light humor which is most refreshing. It is an excellent contribution to Southern literature and worthy of a place in every home which has children to be entertained and instructed."—*From an editorial in the New Orleans Times Picayune. Superbly illustrated by Charles Livingston Bull. Net* $2.00; *carriage paid,* $2.20.

THE IDEAL GIFT BOOK
POLLYANNA
THE GLAD BOOK
Trade Mark
CALENDAR

Compiled by ELEANOR H. PORTER, author of "Pollyanna, The Glad Book."

Artistically decorated and printed in colors. *Handsomely boxed, net,* $1.00; *carriage paid,* $1.10.

AMERICAN COMPOSERS
A study of the music of this country, and of its future, with biographies of the leading composers of the present time.

By RUPERT HUGHES
Author of "Love Affairs of Great Musicians," etc.
and ARTHUR ELSON
Author of "A Critical History of Operas," etc.

A new, enlarged and thoroughly revised edition of Mr. Hughes' successful previous books, "Contemporary American Composers," of which the *Boston Transcript* said: "A popular and valuable addition to the literature of music." *Illustrated from photographs, boxed, net,* $2.50; *carriage paid,* $2.70.

THE SPELL OF JAPAN
By ISABEL ANDERSON
(Mrs. Larz Anderson)

"Mrs. Anderson's book cannot fail to serve as a new and important tie of friendship between the United States and Japan. It could not have breathed a more conciliatory and friendly spirit, and its simple and engaging style cannot fail to win golden opinions for its talented author."—*Nathan Haskell Dole.* "A valuable human document."—*Town and Country. Net,* $2.50; *carriage paid,* $2.70.

THE SPELL OF SPAIN
By KEITH CLARK

As do all of the volumes in the popular "Spell Series," so does this new addition not only describe the attractions of Spain for the traveler, but conveys to the reader the *spell* of that Arabian Nights' land. "It is written with ardor and enthusiasm from a genuine love of Spain and a sympathetic appreciation of her people."—*Chicago News. Illustrated, boxed, net,* $2.50; *carriage paid,* $2.70.

OLD PANAMA and Castilla Del Oro
By C. L. G. ANDERSON

A narrative history of the discovery, conquest, and settlement by the Spaniards of Panama, Darien, Veragua, Santo Domingo, Santa Marta, Cartagena, Nicaragua and Peru. This sumptuous volume is of particular interest and importance now in connection with the recent opening of the Panama Canal. *With maps and many rare illustrations. Boxed, net,* $3.50; *carriage paid,* $3.75.

HOUGHTON MIFFLIN COMPANY'S
Important New Books

HENRY HOLT'S — **ON THE COSMIC RELATIONS**

This study covers with extraordinary completeness, enlightenment, and authority the whole ground of psychic phenomena, so-called, as a basis for the belief in the immortality of the soul. 2 *vols.* $5.00 *net.*

Dr. W. W. KEEN'S — **ANIMAL EXPERIMENTATION and MEDICAL PROGRESS**

Able and authoritative papers on the value of vivisection to surgery and medicine by a surgeon of international reputation. $1.75 *net.*

WOODS HUTCHINSON'S — **CIVILIZATION AND HEALTH**

A breezy, authoritative discussion of some of the most important topics pertaining to the health of men and women living under the conditions of modern life. $1.50 *net.*

STEFAN ZWEIG'S — **EMILE VERHAEREN**

This brilliant and sympathetic study of the great Belgian poet, the man and his work, by an Austrian writer, himself a poet, is of extraordinary interest at the present time. $2.00 *net.*

GEORGE HARRIS'S — **A CENTURY'S CHANGE IN RELIGION**

A comparison of religious beliefs and practices of to-day with those of the first half of the nineteenth century. Some of the topics discussed are: Religion a Century Ago; The Waning of Calvinism; The Person of Christ; The Spiritual Man; Eternal Life; the Heritage of the Faith; the Enlargement of the Faith. $1.25 *net.*

GEORGE HOWARD PARKER'S — **BIOLOGY AND SOCIAL PROBLEMS**

The William Brewster Clark Memorial Lectures at Amherst College for 1914. The author is Professor of Zoology in Harvard University, member of numerous scientific societies, and an authority in his field. 4 *full page diagrams.* $1.10 *net.*

M. A. DeWOLFE HOWE'S — **THE BOSTON SYMPHONY ORCHESTRA**

A record of the circumstances which led to the establishment and development of an institution which has exerted both a local and a national influence of far-reaching effect. Illustrated. $2.00 *net.*

NEW AND RECENT POETRY

T. STURGE MOORE'S — **THE SEA IS KIND**

"Mr. Moore has the magic wand and all he touches turns to gold, or at least to a shimmering silver. Rich, lingering syllables, slow phrases full of sound, long recitative clauses with unexpected little turns of melody—these fill his book to the brim with music as rich and delicate as a Debussy pastoral."—*Poetry.* $1.50 *net.*

CLINTON SCOLLARD'S — **POEMS**

A selection of Mr. Scollard's best verse. The optimistic note running through most of his work is significant, for it suggests a freshness of feeling and a joy in life which is essential to truly artistic work. $1.25 *net.*

HENRY HERBERT KNIBBS'S — **SONGS OF THE OUTLANDS**

The author of "Overland Red" tells, in vivid and swinging verse, stories of Western character and of life on mountain and plain. $1.25 *net.*

GRACE FALLOW NORTON'S — **THE SISTER OF THE WIND**

"The reader will find here the same delicate fancy, the same grace of form, the same beauty of expression which charmed him in Miss Norton's 'Little Gray Songs of St. Joseph.'"—*Living Age.* $1.25 *net.*

MAXWELL STRUTHERS BURT'S — **IN THE HIGH HILLS**

"In this delicate little book of verse there are high qualities of passionate reticence that mark the poet, and a sensitive precision of diction that betokens an academic training not of narrowed pedantry, but of the humanities and a deep interest in men."—*Philadelphia Public Ledger.* $1.00 *net.*

KATHARINE A. ESDAILE'S — **LUX JUVENTUTIS**

A volume of pleasing verse by a young British poet of promise. Her work is thoughtful, melodious, and humanly poignant, ranging from pieces in the firm classical manner to appealing stanzas suggestive of "The Shropshire Lad." $1.25 *net.*

JUST ISSUED

EUGIPPIUS: THE LIFE OF SAINT SEVERINUS

Translated by GEORGE W. ROBINSON, Secretary of the Graduate School of Arts and Sciences in Harvard University.

8vo. Cloth. 141 pages. $1.50 net.

The first translation into English of a document which is both important in Catholic hagiology and yet more so in the history and life of the fifth century. Teuffel, the historian of Latin Literature, speaks of this work as "the incomparable biography of Saint Severinus." A map accompanies the text, and notes and appendices add to its value.

NIETZSCHE,
AND OTHER EXPONENTS OF INDIVIDUALISM
By PAUL CARUS. Illustrated with portraits of Nietzsche. Cloth. Price, $1.25.

The most generally denounced and at the same time widely recommended "Nietzsche Book" published so far.

A well-balanced presentation of Nietzsche's philosophy. The appearance of a philosopher like Nietzsche is a symptom of the times. He is one representative among several others of an anti-scientific tendency. The author here characterizes him as a poet rather than a thinker, as a leader and an exponent of certain unruly and immature minds. Though his philosophy is severely criticised, though it is weighed and found wanting, his personality is described not without sympathy and with an appreciation of his genius. His predecessor, Max Stirner, and other kindred spirits less known than Nietzsche, are also introduced, and if the reader adopts the author's views he will condemn the tendencies and thoughts of these erratic philosophers, but at the same time appreciate their aspirations and love them in their very errors.

UNIVERSITY OF CHICAGO PRESS
IMPORTANT BOOKS

POLITICS

Unpopular Government in the United States. By ALBERT M. KALES, Professor of Law in Northwestern University.

An especially timely book, presenting with great clearness and cogency some of the political needs of the country, particularly the necessity of the short ballot. The author discusses various expedients for restoring the American ideal of democracy. The book has already attracted wide attention and discussion. *270 pages, 12mo, cloth;* $1.50, *postage extra* (*weight* 1 *lb.* 8 *oz.*)

The Courts, the Constitution, and Parties. Studies in Constitutional History and Politics. By ANDREW C. McLAUGHLIN, Professor of History in the University of Chicago.

A volume of peculiar interest at this time, when the courts and political parties are subject to general criticism. The work discusses the power of a court to declare a law unconstitutional, the growth and essential character of political parties, the history of different theories of the Federal Union, and the written constitution in some of its historical aspects.

300 pages, 12mo, cloth; $1.50, *postage extra* (*weight* 1 *lb.* 10 *oz.*)

SCIENCE

Water Reptiles of the Past and Present. By SAMUEL WENDELL WILLISTON, Professor of Paleontology in the University of Chicago.

A comprehensive volume of great scientific importance, by the author of *American Permian Vertebrates,* which has now become a recognized authority in its field. The book discusses in sixteen chapters the classification and skeleton of reptiles, their age, the adaptation of land reptiles to life in the water, and the various orders. With twelve full page illustrations and 120 figures in the text. *260 pages, royal 8vo, cloth;* $3.00, *postage extra* (*weight* 2 *lbs.* 8 *oz.*)

The Weather and Climate of Chicago. (Publications of the Geographic Society of Chicago.) By HENRY J. COX and JOHN H. ARMINGTON, of the United States Weather Bureau.

The importance of this book is indicated by the fact that it is issued under the auspices of the Geographic Society of Chicago, and has been prepared by two of the best-known weather experts in the country.

396 pages, 8vo, cloth; $3.00, *postage extra* (*weight* 3 *lbs.* 1 *oz.*)

In preparation:

The Origin of the Earth. By THOMAS C. CHAMBERLIN, Head of the Department of Geology in the University of Chicago. *16mo, cloth;* $1.00, *postage extra.*

The Evolution of Sex in Plants. By JOHN MERLE COULTER, Head of the Department of Botany in the University of Chicago. *16mo, cloth;* $1.00, *postage extra.*

RELIGION AND ETHICS

The Evolution of Early Christianity. By SHIRLEY JACKSON CASE, Associate Professor of New Testament Interpretation in the University of Chicago.

The beginnings of the Christian movement are here studied from a wholly new point of view. By examining the actual religious situation in which the Christians of the first century lived, the author is able to shed fresh light on many parts of the New Testament. *390 pages, 12mo, cloth;* $2.25, *postage extra* (*weight* 1 *lb.* 11 *oz.*)

The Problems of Boyhood. Studies in Ethics for Boys of High School Age. By FRANKLIN WINSLOW JOHNSON, Principal of the University High School of the University of Chicago.

This book, prepared by the laboratory method, is the result of the wide and successful experience of the author. His book is the first in the field to start with a recognition of the boy's point of view.

160 pages, 12mo, cloth; $1.00, *postage extra* (*weight* 1 *lb.*)

PHILOSOPHY AND HISTORY

William James and Henri Bergson. By HORACE MEYER KALLEN, of the University of Wisconsin.

A striking presentation of the relation between the philosophies of William James and Henri Bergson, by Dr. Kallen. The book is particularly significant as coming from a former student and intimate friend of Professor James.

264 pages, 12mo, cloth; $1.50, *postage extra* (*weight* 1 *lb.* 5 *oz.*)

The Lincoln and Douglas Debates. (Publications of the Chicago Historical Society.) By HORACE WHITE.

This account of the famous debates is notable because the writer accompanied Mr. Lincoln on his tour of Illinois and reported the speeches. Mr. White's later experience as editor of the *Chicago Tribune* and of the *New York Evening Post* peculiarly qualifies him for setting forth adequately the character and effects of the debates.

With 4 plates. 32 pages, 8vo, paper; 25 cents, postpaid 27 cents.

The Nation

NEW YORK, THURSDAY, NOVEMBER 26, 1914.

Summary of the News

A delicate situation, which has since been cleared up, arose last week betwcen the Governments of the United States and of Turkey. Dispatches received on November 18 from Capt. C. Decker, of the cruiser Tennessee, revealed the fact that two days previously the cruiser's launch had been fired on in the harbor of Smyrna. The anxiety in Washington caused by the report of the incident was accentuated by the difficulty that has been experienced, since the entry of Turkey into the war, of communicating with Constantinople. The Administration immediately sent instructions to Ambassador Morgenthau to inquire into the matter and to the commanders of the cruisers Tennessee and North Carolina to take no steps without communicating with the home Government. Ambassador Morgenthau's account of the incident was, however, received on Saturday, and had been written before the communications from the State Department reached him. According to the explanation voluntarily offered to Mr. Morgenthau by the Ottoman Minister of the Interior, the shots were fired across the bow of the Tennessee's launch only as a friendly warning that the harbor was mined. The Ambassador had already been officially informed that the port of Smyrna was closed alike to warships and merchant vessels. The explanation is regarded by the Administration as satisfactory.

The situation as regards the attitude of the Balkan states towards the war remains unchanged. Censored dispatches from Athens dated November 20 stated that Bulgaria had reiterated her assertions of neutrality. It has been suggested that the Austrian advance into Servia might tempt Bulgaria to throw in her lot with the Dual Alliance, and that Rumania might conceivably join with her. In Bulgaria, however, popular sympathy is understood to be with Russia, and in Rumania it is certainly on the side of the Allies. Moreover, one of the Rumanian Ministers, M. Jonesco, if we may credit press reports, appears to have been singularly outspoken in his advocacy of the cause of the latter. That Turkey herself is anxious concerning the course that Bulgaria may pursue is evident from her military preparations in Thrace. According to dispatches from Salonica to the London *Morning Post*, on November 20, large forces of troops are concentrated in European Turkey, and energetic steps are being taken to strengthen the fortifications of Adrianople.

Despite the kindly undertaking of the Turko-German alliance to exempt the Italian provinces in Libya from the scope of the "holy war" that has been proclaimed for Islam, it is evident that the situation is regarded in Italy as one calling for exceptional precautions. The Italian Government last week assigned $9,200,000, of the $80,000,000 appropriated for military purposes, to extraordinary military expenses in Cyrenaica. Signor Salandra's Cabinet, since its reconstruction, has evidently endeavored in good faith to hold fast by the policy of its predecessor, but the situation, already sufficiently difficult, as is brought out in the letter from a correspondent in Rome, which we publish elsewhere, has been greatly complicated by the entry of Turkey into the war. A speech in favor of intervention on the side of the Allies, recently delivered in the Constanzi Theatre by Signor Nathan, ex-Mayor of Rome, though an expression of non-official opinion, cannot be disregarded as an indication of the trend of public sentiment.

The British war loan of £350,000,000, issued at 95, carrying interest of 3½ per cent., and redeemable at par on March 1, 1928, was closed officially on Tuesday. The loan was considerably oversubscribed, and already it is stated that a small but real premium has been established for the issue.

According to the Stockholm correspondent of the London *Morning Post*, writing on November 20, the British Admiralty has accorded permission to Swedish transatlantic liners to make the passage north of Scotland, thus removing the most serious trouble for Swedish shipping as a result of mined waters.

Japan has notified Great Britain of her readiness to hand over the Marshall Islands and other German islands in the Pacific, now occupied by the Japanese, to Australia, which will send forces to occupy them until the war is ended, when their ultimate disposition will be decided.

The revolt in South Africa appears to have been virtually suppressed. A Reuter telegram from Pretoria, on Monday, declared that it was officially announced that De Wet's rebel commando had been surrounded by loyal forces on the Vaal River and had surrendered. Only De Wet and twenty-five men escaped. Other recent reports have stated that De Wet's forces were becoming disheartened, and that many of his followers were deserting him and returning quietly to their homes.

A serious riot occurred on November 19 among the alien prisoners in the British detention camp, at Douglas, Isle of Man. Apparently there was a concerted attempt on the part of a number of the prisoners to overpower the guards, the idea being to seize a boat in the harbor and escape. Four of the prisoners were killed and twelve injured by the guards in quelling the riot.

The internal dissension in Russia, as well as in Ireland, on which German diplomatists apparently counted, has not materialized into any movement of sufficient importance to affect the course of the war. Nevertheless, that disunion has not been wholly absent is indicated by the accounts from Petrograd, on Monday, of the discovery of a revolutionary plot in which five members of the Duma were implicated. Several arrests were made, and the semi-official statement recording the circumstances takes note of the attitude of "some members of the Social Democratic Associations, who continued an activity aiming at the downfall of Russia's military power by means of an anti-war agitation, the distributing of secret proclamations, and the conducting of propaganda by word of mouth."

The text of a protest addressed by Germany to the United States against the violation of the Declaration of London, by Great Britain and France, was made public on Tuesday. The protest set forth in detail the points wherein the Declaration of London had been violated, particularly in the matter of contraband of war, and requested the Government of the United States to define its position and intentions. In reply the Administration informed the German Government that, in view of the fact that some of the belligerent Powers involved in the present war did not care to ratify the Declaration of London without material modifications, this Government withdrew its suggestion, made at the beginning of the war, that the Declaration serve as a code of law for naval warfare. The position of this country, the answer continued, would be rested on its rights under international law as interpreted by the traditional American policy up to the time that the Declaration of London was signed in 1909.

In connection with the opening of the Federal Reserve Banks, President Wilson, on November 17, addressed a letter to Secretary McAdoo in which he reviewed the economic and social future of the country, expressing confidence that an era of prosperity might be expected.

As a result of the completion of elaborate wireless observations, made through the wireless stations at Arlington and on the Eiffel Tower, it was announced by the Naval Observatory officials on November 21 that the actual difference in longitude between the official meridians of Paris and Washington is 5 hours 17 minutes 36.658 seconds.

The German Reichstag will open on December 2. It will, it is expected, be a short session, and business will be confined to the voting of a new credit of five billion marks and the ratification of the various emergency laws promulgated by the Bundesrath.

According to a cablegram from Bordeaux, received by Thomas M. Moore, Commissioner-General at the Eastern headquarters of the Panama-Pacific Exposition, the French Cabinet on November 20 decided that France should officially participate in the Exposition.

The withdrawal of United States troops from Vera Cruz was commenced on Monday. We comment elsewhere on the general situation in Mexico.

The deaths of the week include: D. R. Wilkie, November 17; Dr. Rudolf Emmerich, November 18 (?); Dr. Charles Sedgwick Minot, Robert J. Burdette, Peter Percival Elder, November 19; Mrs. Vinnie Ream Hoxie, Dr. George James Bayles, Sir Edward P. Solomon, Dr. Ernst D. Richard, November 20; Major-Gen. von Voights-Rhetz, November 20 (?); Brevet Brig.-Gen. John B. Frothingham, November 21.

The Week

Fresh war loans every week or two, mounting taxes, serious disturbance of industry, increasing numbers out of work—this is the order of the day in Europe. How long can the nations endure it? The London *Economist* argues strongly that the war cannot last much longer, because it is already bringing financial ruin in its train. The savings of years have been swept away in the past three months. Capital is being destroyed in vast amounts every week, and soon the process of financial exhaustion will compel taking up the question of a possible peace. This is good reasoning, but, unfortunately, war is the denial of reason. That countries can go on fighting even after they are bankrupt has more than once been proved. One point made by the *Economist*, however, is sound. It declares that England's superior position just now, financially and industrially, is due partly to the fact of her not having a system of compulsory military service. If she had been forced, like Germany and Austria and France, to call to the colors at once every able-bodied man, not even her command of the sea could have prevented something like a financial collapse. Voluntary enlistment in the army enables her to spread over many months the strain which the other nations have to undergo in a very short time. Meanwhile, her great resources of capital can be leisurely mobilized.

As evidence of German thoroughness and system, the extract published by the Paris *Temps* from a book of military instruction published in Berlin in 1903 is interesting. Written by a professor in the Berlin War Academy, it consists of model reports, letters, notices, etc., for use in France during a German occupation; and the particular specimen published is a reply to charges of atrocity. It embodies, in fluent language, the standard type of answers to such charges—absences of specification, untrustworthiness of witnesses, admission of the act, but explanation that, so far from being an atrocity, it was simply the necessary punishment of crime, and the like. If the *Temps* publishes it as a curiosity, and not as proof of anything diabolical in the German nature, it is more rational than have been many discoveries of things hidden or obscure, during these months of terror. The book might have been hailed as conclusive evidence that the Germans had determined, years before the war began, to indulge in all manner of atrocities and then turn out machine-made lies in answer to all accusations; whereas the only legitimate inference from the disclosure is that, among the various labors of their officers in the field which it was desirable to lighten so far as possible by system, they did not overlook even that of letter-writing. But if the French were really to regard this "boiler-plate" letter as proof of a deliberate purpose to commit outrages, they would offend less against reason than did the Germans when, having discovered a Belgian scheme of defence against a possible German invasion, they declared that this was proof that Belgium had never intended to be neutral at all!

Count von Reventlow, a leading German naval writer, and perhaps the animating spirit of the Navy League, discusses at length in *Das Grössere Deutschland* the rôle of the German navy in the war. He explains why it is that the Kaiser's capital ships must for the present be inactive. The significant point of his contention is that it is absolutely "indispensable" that the Germans capture the French and Belgian coasts as a basis for their final goal, which is the defeat of England, provided that the naval war against England is to be carried on "actively and energetically." We confess that we cannot see wherein the possession of Dunkirk, Calais, or even Boulogne would alter the naval situation. Indubitably, it would intensify British anxiety, but so long as the English navy held control of the sea, the German fleet could not find its way to Calais without facing a general engagement. Count von Reventlow's argument is that, with the northern French ports in German possession, England could no longer hermetically seal up the North Sea, and that some merchant ships could find their way into the northern French harbors. But as he also admits that the British cruisers would still control the trade routes of the high seas, it seems to us that the whole argument falls to the ground. It would be much better frankly to admit that the German fleet stays at home because it is numerically so inferior to the British that the odds are at least two to one against it. Of course, no invasion of England is possible until the British fleet is completely destroyed; and that is unthinkable at this stage of the war.

Recrimination, with a counter-charge for every charge, between the warring nations has now passed from matters involving the rules of war to questions concerning general international law. The latest dispute has to do with the observance of the Declaration of London. Germany brings forward several specifications in support of her assertion that England is disregarding its prescriptions concerning contraband and conditional contraband of war. Some may smile at this sudden zeal of the German Government on behalf of international agreements. Belgium might like to say a word about that. The point might also be made that the Declaration of London is not a recognized part of international law, binding on Great Britain, since it was never ratified by Parliament. The fact is, however, that the British Government, like the German, declared at the beginning of the war that it would observe the Declaration of London, though not obliged to do so. Thus the German protest has a right to be heard. It appears to be based in part upon regulations regarding the trade in foodstuffs and raw materials which England at first announced, but has since changed or relaxed. She did this, it is believed, at the instance of the United States, and in order to facilitate our legitimate export business. But it is probably true, as the German Foreign Office asserts, that the English command of the sea is being utilized to cut off supplies from Germany in ways not in accord with the spirit or the letter of the Declaration of London. This, however, is one of those charges which, at the end of the war, will have to be duly "assessed," in President Wilson's phrase, by international tribunals.

If it is true that Prince von Bülow has been appointed Ambassador to Italy, it would appear that, after all, some understanding of the weakness of recent German diplomacy is beginning to dawn on Berlin. Von Bülow's ability no one can question; his Italian wife, his four years of previous service in Rome in this capacity, and his being an ex-Chancellor, make him by all odds the most available man in German public life to go to the Quirinal in this grave crisis. Everybody is now playing the best possible cards for Italy's support. Franco has sent Delcassé and England has been working night and day to bring her over to the Allies' cause. This sudden concentration of diplomatic forces upon Italy is perhaps responsible for the Foreign Secretary's bidding all of his leading Ambassadors in Europe to hasten to Rome for consultation, apparently as to what Italy's future policy ought to be. One may hope that there will be no change from her present self-restraint. The war is costing her dearly in the depression of business, the loss of trade, and the tourist traffic, and

the price of her partial mobilization, but at least her soil is not blood-drenched. Yet it is undeniable that there is still a strong popular demand for war, as in the first days of the struggle, while a large section of the press is bitterly anti-German in comment and cartoon.

Senator Lodge's blood is boiling again. This time it is over the Turkish affront to the American flag. He confesses that he knows nothing about the facts, but he is certain that this contemptible Democratic Administration is handling the affair with a mixture of supineness and imbecility. It should be understood, however, that all this display of radiant heat by the Massachusetts Senator is purely partisan. His blood never boils except for party purposes. Personally his temperature never rises. Some even say that it is usually subnormal. But whenever he sees a chance to make a point against a Democratic President, he manages to wear a flushed face, while his eyes appear bloodshot. But his family physician would tell him that this is not conducive to clear vision. Among the things which Senator Lodge now fancies that he sees, his eyes in a fine frenzy rolling, is the fact that the feeling in Europe for President Wilson is only one of "ridicule." But this is certainly Lodge's private discovery. Rulers and the press abroad may think in their hearts that Woodrow Wilson is a nincompoop, but, if so, they have taken precious good care to act as if they thought he was a strong President, having in foreign affairs the confidence and support of all his countrymen—except Henry Cabot Lodge. The Senator seems to have a bad case of what the old lady called bellicose veins.

Over the sailing of the American troops home from Vera Cruz on Monday much anticipatory head-shaking has been done. It has been described as a step both foolish and perilous. Mexicans, it has been said, will seize upon the occasion to begin a general throat-cutting of Americans and other foreigners in Mexico, and our armed forces will speedily have to be sent back. These predictions might alarm us more if they did not come from the same newspapers that assured us that the last withdrawal of American soldiers from Cuba was a terrible mistake, since we should have to go back in six months to rescue the island from a welter of blood. Take the purely military aspect of the evacuation. Gen. Funston had some 6,000 men at Vera Cruz. If there had been a question of making head against the combined Mexican armies, he would have needed at least 50,000 men before the War Department would have dreamed of letting him march inland. And if that port had to be taken and occupied again, it could be with the greatest ease. The Mexicans have nothing that could stand against our battleships. As it is, a few war-vessels are to be left off the harbor, and their presence there will be as much of a reminder, or a threat, militarily speaking, as the sight of regiments on shore. In short, a cool view of the evacuation will make it appear of the slightest conceivable importance, so far as it affects the project of anything like a conquest of Mexico, while the true reasons for it are in quite another order of ideas.

What are those reasons? They arise partly from the President's desire to make a strong appeal to Mexican patriotism. That any such thing exists will, of course, be scouted by our high and mighty Imperialists, but there it stands. What was meant by the great outpouring of students in the Mexican capital to rejoice over the announcement by our Government that the American flag would soon cease to fly over any portion of the territory of Mexico? It meant that Mexicans feel about it just as we should in their places. The holding of their principal port by the armed power of an alien Government has been just as distressing to them, in the midst of their domestic convulsions, as would have been to Americans the seizure of New York by the British in the darkest days of our Civil War. That the occupation of Vera Cruz was declared to be only temporary made it endurable for the time being; but it has all along been a source of grief to the Mexican people, a hurt to their national pride; and its ending will no doubt cause something like a general jubilation. It ought also to cause the Mexicans to believe that the United States wishes to treat them with the utmost good faith and generosity. In this sense, the withdrawal from Vera Cruz is like a fine gesture of confidence. It is an appeal to the Mexicans of a sort which they would be truly dense if they did not appreciate. Our country is leaving Mexico alone to work out her immensely difficult problems. This does not mean that we have ceased to take interest in her, or that we shall be any the less watchful and even zealous in protecting American rights within her borders. But it does exhibit to the Mexicans, in a very striking way, the purpose of the President to live up to the assurances which he publicly gave when our troops went to Vera Cruz.

There is as yet no means of knowing whether President Wilson really intends to be present at executive sessions of the Senate. The mere rumor that he does has set the gossips at the Capitol in a flutter. They admit the President's right to attend the Senate's secret sessions, if he chooses—especially those dealing with nominations to office and treaties. Indeed, the Senate rules provide for this. Washington used sometimes to sit with the Senate, though his experience with it on one occasion led him to say, with profane emphasis, that he would never go there again. This was perhaps the time when, according to Maclay's "Sketches of Debate in the First Senate of the United States," the Father of his Country got very red in the face with anger. His successors have left the Senate to its own secrets—which are, as a rule, no secrets at all. President Wilson may be planning a reversion to Washington's example in this matter, as in the reading of his messages in person; but his visits to the Senate Chamber would even so be rare. In the nature of the case, he could not be expected to jump into an automobile and rush to the Capitol every time a Senator moved to go into executive session.

In both the eastern and western theatres of war, the news is bad for the Progressives. In Massachusetts, four Progressive candidates for Congress have announced their return to the party "that gave us a Lincoln, a Garfield, and a McKinley," the last of the four explaining his return by saying: "The smoke of battle has cleared away, and out of the conflict we have discovered the one fact, 'A house divided against itself cannot stand.'" The discovery had been made before, but it now takes a higher place than ever as the first principle of social justice. In Kansas, the Emporia *Gazette*, which from the beginning ought to have been put under strict censorship by the Progressive headquarters, prints in a conspicuous position a dispatch from Washington commencing: "It will be a new and chastened Republican party that will crowd the Democrats close for control of the next House of Representatives, and this despite the fact that many of the old reactionaries will be back in their former places." Cannonism, we are informed, "belongs as much to the past as if it had existed and flourished in some prior age, and the old representatives of the system will never again exert their former influence upon either the policies or the destinies of the Republican party." The only solace for this disconcerting change is that the Progres-

sives caused it. In the State that single-handed gave them almost half of their total electoral vote in 1912, however, their abhorrence of a divided house seems to have got the better of their hate of that extreme form of Cannonism known as Penroseism.

Campaign expenditures in the recent election vary as widely as household expenses. One candidate for the House of Representatives reports an outlay of $6.15. At the other end of the line is Senator-elect Wadsworth, who confesses to an expenditure of $20,000. In between comes Senator-elect Beckham, of Kentucky, who spent $2,500, but had a campaign fund at his disposal of more than twice that. How shall we account for these differences in amounts spent? Offhand, one would be inclined to say that the large sums represent close contests, or contests thought to be close. But this hypothesis is not borne out by investigation. Senator Cummins had a hard fight on his hands, or everybody believed he had, yet he made no expenditures beyond his travelling expenses. To some extent, a suggestion made by the New Orleans *Times-Picayune* is doubtless true; this is that men of large means naturally spend lavishly, more lavishly than they need, simply because they can and because they wish to be quite sure of not losing on account of not using the particular kind of ammunition with which they are well supplied. Much depends also upon what people are accustomed to. In a night, apparently, we have become habituated to campaigns that, to a Hanna, would have seemed the depths of parsimony.

"Electoral fatigue" is the happy phrase of ex-Mayor Matthews of Boston, to apply to the revolt of voters against being asked to go to the polls so frequently. Something of this "tired feeling" must enter into the explanation of such a result as the rejection of all the ten Constitutional amendments submitted to the people of Wisconsin on November 3. The official figures are now published, and show the overwhelming nature of the defeat. By majorities ranging from 56,000 to 107,000 the Wisconsin electors showed that they would not accept La Follette's plans to round out the "Wisconsin idea" to perfection. The initiative and referendum, State insurance, the recall of elective officials, except judges, and the rest, all went down. All told, it is a blow to La Follette harder than his loss of a Governor and United States Senator. Of course, other causes contributed. In the general slump of Progressive notions, Wisconsin was bound to share. But over and above this there must have been a pervasive weariness with forever tinkering with the laws and the Constitution.

If it be true that Gov. Ammons of Colorado and Governor-elect Carlson are working together upon a plan for restoring effective State government in the mining region, the news is most welcome. An investigating committee of the Legislature has appealed to the Governor to "prepare to accept for the people of this State the responsibility of again being a State," and has asked him to make it clear to the people that law and order must be preserved, even if it should become necessary to call every able-bodied man of military age into active service. Whatever view be taken of the rights and wrongs of the mine trouble, this fundamental duty of a civilized State is paramount to all other considerations. If the mine operators have violated requirements of the State laws, they should be compelled to observe them; but this compulsion must come in legal ways and not by armed violence or the threat of it. If public opinion in Colorado had, from the first, insisted on a strong assertion of the State's authority, and had demanded that whatever resources might be needed for this purpose should be furnished to the Governor and effectively used by him, the State would never have fallen into the condition which has so disgraced it.

The check which the Minnesota Minimum Wage act has received in being held unconstitutional by an inferior court is chiefly significant as showing how little the tribunals of one State are affected by the decisions of another. Minnesota has one of the mildest of the laws which were passed by seven States in 1913; Oregon has one of the most radical; yet six months after the Oregon law is held Constitutional, a judge declares the more cautious measure invalid. The act would have granted a board of commissioners power merely to fix the wages of all women and of all minors. No authority was given it over hours or conditions of work, although Massachusetts, by a law passed before 1913 and upheld in the Federal Supreme Court, has regulated both. Yet this is apparently thought to be beyond the police power of Minnesota. Appeal to the State Supreme Court will determine if the interpretation of such laws is really different in Oregon and in Minnesota.

With all the conventions that are held from one year's end to the other, it seems strange that only now has the first conference of American Mayors been assembled. The problems of one city must be similar to those of many others. Conferences of State officials of various kinds have met in response to the feeling of need for information regarding the way in which tax questions, for instance, were being handled in other commonwealths. Municipal conventions of one sort and another have been held by permanent organizations. Yet the Mayors have gone their several ways without learning directly from one another how they were meeting their tasks. One reason for this lack has probably been the temporary character of the office. A city likes a new Mayor just as it likes a new pavement: the change is an indication of progress. A more powerful reason may be the very onerousness of the work of the Mayor's office. Many Governors have something like a vacation when the Legislature is not in session, but a Mayor's work is never done. We are a bit reluctant, too, to follow the lead of other places. Jealousy between towns has been a fruitful theme for jesting. Now we are to have a central bureau of information for the benefit of Mayors. Not the least valuable part of its work might be the collection of facts pertaining to European cities.

In the *Edinburgh Review's* most arrogant days, no one ever wrote, "Who goes to an American watering-place?" That was the period when Europeans patting our shaggy continent on the back did it by praising two resorts—Niagara Falls and Saratoga; when every travelling Englishman followed Sir William Johnson's example in seeking the latter spot; and when the best of American society was proud of Congress water and the little city that had the largest hotels in the world. The springs somehow came to be regarded as provincial—the result of what Lowell rebuked as American "tenderness" in advancing our own attractions, and of Germany's enterprise in advertising her numerous waters; but now the war brings hope of reviving their glories. The Commissioners of the State Reservations are already equipping a new bath-house, and drafting plans for another "large and elaborate establishment." This is significant to those who know how desirable the mere having a malady is to some people. No matter how little connection there may actually be between ill-health and going to foreign baths, certain people *must* complain, and, complaining, seek a health resort.

"BRITISH LIES" AND AMERICAN SENTIMENT.

It is, perhaps, not surprising that our German friends, chagrined or exasperated by the general tone of American opinion, are prone to persuade themselves that its explanation is to be found in the poisoning of the American mind by British falsehoods. There was a time when the charge of corruption by "British gold" was a favorite recourse of our own politicians whenever other ammunition ran short. The Cobden Club was, during many years, represented by the Republicans as supplying the sinews of war to the wicked Democrats who were trying to overthrow "the American system" of protection; and at a later period it was the Democrats who, in their turn, hurled at the Republicans the charge of having their war-chest replenished from Lombard Street, in their treasonable assault upon "the American system" of bimetallism. We say "the Republicans" and "the Democrats," but in reality there can have been only a very insignificant number of intelligent persons in either camp who really believed that anything of the kind was taking place; in the main, the whole thing was a bit of campaign stage-play. Men of sense knew that the story of "British gold," in either instance, was a myth, pure and simple.

The case is not quite the same in this matter of "British lies." The assertions we have referred to, the notions concerning the part that has been played by "British lies" in the formation of American opinion on the war, are put forward by Germans of the highest intelligence and of unquestionable sincerity and earnestness. Take such a letter as that of Prof. Paul Darmstaedter, of Göttingen, which appears in our columns this week. "I find," he says, speaking of the American press, "a good deal of wrong information, based on the infamous lies of the English press, and, of course, false conclusions drawn from false premises." And the professor declares his confident "trust that the opinions of many Americans will change when they are informed about these matters." All this, and the like said by other Germans, is undoubtedly the sincere expression of their conviction. Moreover, unlike the "British gold" charge, which was a pure figment of the imagination, it may at least be pleaded for this belief that it is not made out of absolutely nothing. There have, of course, been false statements sent to us from England, as there have from other countries; and it is a fact that the cutting of the German cable put Germany at a disadvantage—in spite of her use of the wireless—in the transmission of communications, either true or false. But neither communication of falsehoods from England nor suppression of truths from Germany has had any appreciable influence upon the formation of American opinion. The war is now in the second half of its fourth month, and we have yet to see, among all the voluminous statements of the German case, the exposure of a single "British lie" which had any part in determining the sentiment of the American people.

What *did* determine that sentiment it is easy enough to recognize. One has only to turn to what was said in representative American papers at the very beginning; what was said before there was any talk of atrocities and before the German cable was cut. Take this, from the "Summary of the News" in the *Nation* of July 30, covering events to the close of July 28:

> It has been apparent from the first that Austria is determined to accept nothing less than a complete and humiliating submission on the part of Servia, and that in this policy she has the support of Germany. . . . The danger, then, is that Russia, as the protector of the Slav states, may become involved, and if Russia, then the other Powers of the Triple Entente.

Does not the German "White Paper" confirm, and more than confirm, this view of Germany's responsibility for Austria's belligerent attitude? And in its leading editorial on August 6, the *Nation* said:

> Germany, having grasped her sword, has proceeded to lay about her with a high hand. Her entrance into Luxemburg, her invasion of Belgium—both of which have had their neutralization solemnly guaranteed by the European Powers, Germany included—were the directest kind of challenge to England, and there was never any doubt as to how it would be answered. . . . If Germany could beat the armies of both Russia and France, with England remaining aloof, she would attain not only the hegemony of all Europe, but complete dominance. She would seize Belgium and Holland, and present a formidable front on the North Sea. By means of these latent threats, the Emperor William has, as it were, put himself in the position of the first Napoleon. If a coalition against his overweening pretensions did not exist, it would have to be invented.

Right or wrong, these judgments—as to the responsibility for the immediate bringing on of the war, and as to the nature of the international crime involved in the invasion of Belgium—were based upon the broadest and most patent considerations, and not in the least upon "British lies"; right or wrong, these same judgments were arrived at simultaneously by almost the whole American press; and right or wrong, no technical pleas concerning the exact date of mobilization, or other unessential details, can possibly break them down. Nothing that the champions of Germany have brought forward lessens by a feather's weight the force of the two fundamental facts—her undeviating insistence on Austria's pound of flesh, which made peace impossible, and her violation of Belgium, which made England's participation in the war inevitable.

That the case is not so simple when the more remote—if you please, the deeper—causes of the war are examined, we do not deny. To determine the rightfulness or unrightfulness, the wisdom or the folly, of the policies of the various nations in the course of the last ten, or twenty, or forty years, is an undertaking which will tax the powers of the future historian. Most Germans sincerely believe that their country was the object of a hostile policy on the part of the Entente Powers, against which she was driven to protect herself by force of arms. Most non-Germans believe, with equal sincerity, that this is a gross exaggeration of the facts, and that in so far as it is true it is but the natural counterpart of the militarist spirit and militarist ambition which have been steadily acquiring, year after year, more and more complete dominance over the German nation. To strike a just balance in this large question is more than can be expected of even a neutral nation at a time when the world is in the throes of such an agony as is now upon us. Most men content themselves with a simpler judgment. Before the world war—so runs their thought—each side professed to desire that so tremendous a calamity might be averted; and accordingly that nation must be adjudged guilty which, while thus professing, conducted itself in such a manner as to make the averting of it impossible.

One word, in conclusion, on the subject of lies. We shall not undertake to institute a comparison between the amount or the kind of lying that may have been done on the English side and that on the German. But there is another element that enters into the case, and which, to our mind, is of far more serious concern. We refer to the question not of uttering falsehoods, but of believing them—not of mendacity, but of credulity. Professor Darmstaedter, for example, is quite sure that the charges of "German atrocities" are false—so sure that he will not even use the phrase without quotation marks; but he accepts without a moment's hesitation the German assertion that the acts so designated were fully justified by the conduct of the Belgians, who "behaved like beasts, and murdered and mutilated our

brave soldiers in a treacherous way." This, however, as wars go, is a minor matter; there are other instances far more important. He speaks of the "many lies" told about "the so-called breach of Belgian neutrality"; and he declares that "it is quite certain that France and England had the plan to attack Germany by way of Belgium." The assertion that the invasion of Belgium was no violation of treaty pledges may now, in spite of the German Chancellor's famous confession, have become orthodox doctrine in Germany; and the second assertion has, as a matter of fact, been made by the German Foreign Office. But in support of the first no argument has been offered that could stand a moment's examination; and in support of the second there has never been produced a shred of evidence. To believe everything that is said on your own side, while flinging broadcast charges of infamous lying on the other, is a deplorable state of mind—and a dangerous one. How devastating may be its moral effect, the insensate hatred of the English which is so lamentably general in Germany bears melancholy witness.

HOW WE "MUDDLED THROUGH."

"And the thing stood so," says President Wilson, in his recent letter to Secretary McAdoo, "until the Democrats came into power last year." The thing he refers to is a condition, in the economic life of the country, in which "suspicion and ill-will" were rife, in which "wrongs and misunderstandings" gave a bad tone to men's thoughts, in which "interests harshly clashed which should have coöperated." But now, with the tariff readjusted, with the new banking system put in operation, with the Trust laws revised, all this has become, or is fast becoming, a thing of the past; "the mists and distempers which have so embarrassed us will be cleared away," and "we shall advance, and advance together, with a new spirit."

Whether this contrast with our past, and portrayal of our present happy state, goes beyond the reality or not, it is certainly a fact that a change of somewhat this nature has actually taken place. Some things of primary importance have been satisfactorily settled which were long the subject of what looked like almost hopeless controversy; and, apart from any such definite achievement, there is incomparably less of the spirit of antagonism between "big business" and the general public than there was some years ago. It would hardly be profitable to attempt to fix the exact degree of the change that has taken place. What strikes us as more interesting is another question suggested by the President's remarks. When he says that "the thing stood so until the Democrats came into power last year," he apparently makes for the Democratic party a claim of altogether extraordinary and exclusive merit. The question therefore presents itself whether this is a fundamentally sound view of the case; whether, upon a judicial consideration of the history of the past twenty years, we are not bound to make different distribution of praise and blame all round.

We speak of twenty years, because, in its distinctive character, "the thing" of which President Wilson speaks dates from that outbreak of discontent in the country at large, and that deep cleavage within the Democratic party, which followed upon the panic of 1893. Out of this grew a political situation which caused our party divisions to take on very much the character of a conflict of classes; and for this development the free-silver agitation, as conducted under the leadership of Mr. Bryan, was chiefly responsible. It may be argued, with considerable plausibility, that he builded better than he knew. Capitalistic interests really were guilty of great abuses, and Mr. Bryan, it may be argued, though wrong in the particular matter that he took hold of, stirred up a sentiment which, however ignorant, was righteous. The fact is that half the country was wrought up to a pitch of something like frenzy over an imaginary "crime of 1873"; and under the influence of this delusion there grew up not only an altogether needless ill-feeling and misunderstanding, but the country was confronted with the immediate danger of a disastrous unsettlement of business, and an injury to its financial stability from which it could hardly have recovered for a generation.

Upon the Trust issue, the position of the Democratic party was far more sound; but even in this there has been much that is faulty. A great deal of the Democratic talk on Trusts has been of that kind which ignores realities, and seeks to settle a question of immense difficulty and complexity by the application of some simple dogma. When the Supreme Court, in the Standard Oil and Tobacco cases, found a way to make the Sherman law effective without making it an instrument of blind destruction, there was a great outcry from the rock-ribbed Democrats who had been preaching a holy war against monopoly. Even the Democratic platform of 1912 gave expression to this feeling. "The Sherman Anti-Trust law," it declared, "has received a judicial construction depriving it of much of its efficacy"; quite ignoring the fact that it was precisely by interpreting the law in such a way as not to demand impossibilities that its practical efficacy had been vastly increased. The firmness with which the party adhered to the anti-monopoly idea, during all those years when consolidation seemed to be sweeping everything before it, and the "captains of industry" appeared to have become the idols of the nations, is most commendable; but there was in its attitude an element of crude dogmatism.

Now, if we have arrived at a condition approximately answering to President Wilson's description, this is because, partly through good sense, partly through good fortune, we have managed to make use of what was good in the attitude and purpose of the Democrats and to slough off that which was bad; we have steered a middle course between the complacent standpatism of the old-time Republican leaders and the cocksure reform attitude with which the name of Mr. Bryan used to be chiefly associated. We have followed neither the captains of industry nor the champions of the people. In the matter of currency and banking, the Democratic party, when it came into power, passed a measure as different as possible from anything it had thought of when it was the Opposition party, a measure largely embodying the results striven for by the Aldrich Commission. In one signal respect—Government control—it differed radically from what was contemplated by that Commission; but on the other hand, as finally passed, it was free from the fiat-money and unsound-credit notions which have been so rife in a considerable section of the Democratic party ever since the Civil War. Looking back over the whole story, one cannot but feel that in the struggle extremists on both sides have been driven to the wall. The credit for what has been attained is to be given not exclusively to any one party or set of men; and a large, perhaps the chief, share in it is to be assigned to the influence of sober and intelligent criticism not specially identified with any party or interest.

BRAZIL'S QUARTER CENTURY.

President Wilson's congratulations to Brazil upon the completion of twenty-five years under republican government had special reason for heartiness. If only all the South American republics, and especially the Central American, would conduct them-

selves as, upon the whole, the youngest of them has done! A conservative spirit was manifested in Brazil in the very act of declaring her independence of Portugal. In the other Latin-American countries, independence meant throwing off, not only allegiance to a European government, but the form of monarchy. As if to mark the fact of separation from political connection with the Old World, these New World governments adopted, on paper at least, a popular system of government. Independence and democracy, as in the great republic that had cut loose from England half a century earlier, came together. In Brazil, this was not the case. When, in 1821, the Court of Lisbon, jealous of the rising influence of the country that a few years before it had elevated to the rank of kingdom, abolished the principal courts and other public institutions of Rio de Janeiro, closed the schools, and ordered the King to return to Portugal, his son, Dom Pedro, far from allying himself with the home Government, issued a manifesto, declaring: "So long as measures are adopted having for their object the welfare of all and the happiness of the nation, tell the people that I will not absent myself."

He proceeded to form a Cabinet of lawyers from the provinces, accepted for himself and his successors the title of "Perpetual Defender of Brazil," and convoked a constitutional assembly. He had thus put himself at the head of the movement for independence, as rulers of greater fame have not always done. Nor did he waver from his purpose. When it was learned that Portugal was about to send over a strong military force, he issued another manifesto, exhorting the people of Brazil to unite and win complete self-government. He gave them as their and his battle-cry, "Independence or Death." In 1822 he was proclaimed Constitutional Emperor of Brazil; two years later, he granted a fairly liberal Constitution, not, however, as one historian remarks, "for actual use, but simply to gratify the desires of those who wanted it"; and in 1825 Portugal recognized the independence of Brazil. There had been little bloodshed. Moreover, the conflict that raged in most of the rest of Latin-America between the liberalists on the one hand and the loyalists and the neutrals on the other had amounted to little in Brazil. Opinion had been substantially united upon the point of independence. There was less unity upon the kind of government that should follow independence. In part of the country, some sentiment in favor of a federal republic appeared. But the prestige of the monarchy was strong, naturally enough, and, besides, it had already been made plain that stability and republican government were not usually associated in Latin-America.

If independence was won in a happy manner, democracy, or rather the abolition of the monarchy, came about very simply. It was in 1889. Another Dom Pedro sat on the throne. He had made a tour through Europe and the United States, and had been received upon his return with demonstrations of affection. Even the advocates of a republican form of government looked forward to his finishing his reign in peace. But there were extremists who argued that the change could be more easily brought about while he was on the throne, a confiding Emperor, than when it was occupied by his suspicious and energetic daughter. In this way, his very liberality proved his undoing. On the 14th of November, 1889, the palace was quietly surrounded, the next morning Dom Pedro and his family were placed on shipboard and sent to Portugal, and the United States of Brazil came into being. But the new republic was in reality a military despotism, and so remained for two years until 1891, when at length a national assembly convened and framed a Constitution. Brazil had entered the family of Western republics late, but she had entered it without a record of civil strife, dictatorships, and political unrest. The cynical might point out that it was not until she abandoned monarchy for democracy that such troubles befell her!

These troubles, however, were transitory, and Brazil has long held a place of honor among her neighbors. Her acts have not invariably been wise. In certain economic questions, particularly, she has shown a faith in the magic of a governmental fiat for which we, unfortunately, are estopped from criticising her. Yet it is her economic progress as much as anything else that has raised her to her position in the front rank of Latin-American states. In international politics, too, she holds no mean place. Her representatives are enlightened men, seizing every occasion to make use of arbitration rather than war. That they know much more about us than we know about them is not to our credit. Most Americans, even now, would be a bit surprised to hear that Brazil is as large as the United States, excluding Alaska, although she has only a fifth of our population. With such a history and such resources, she is evidently destined to play an increasingly important part in the politics of this hemisphere. For this destiny, we as well as the Brazilians, may be unaffectedly glad. It is of no little value that in our not always smooth relations with the Governments to the south of us we may be able to say, "There stands Brazil! Go and do thou likewise."

EMBATTLED LITERARY FELLERS.

George Warrington, we know, had a low opinion of literary men in general. But he reserved his special wrath for writers who "sell their feelings for money." For that performance, "humbug" was not too strong a word, Warrington thought. What epithet he would have found for authors who for money sell their feelings, or their pretended feelings, about their country's imminent peril, we cannot guess. He might have drawn upon Capt. Costigan's vocabulary! But we think he would have agreed with one contention which we have heard put forward. This is that every literary man, high or low, Colonel or clown, who goes outside of his usual employments to write about the war—merely marketing his name, though he have no special competence—ought to turn over every penny that he is paid to the Belgians or some other victims of the war. To get advertising out of the awful calamity is repulsive enough. To coin money out of it is positively disgraceful.

This off our mind, we may go on more calmly to note some of the aspects of the literary rush to the fray. All must have noticed that the various warriors of the goose-quill are not of one opinion. A good part of their energy is devoted to refuting one another. Yet they always begin with a fine flourish of compliments—a sort of gallant salute before joining combat. Thus Shaw speaks handsomely of Wells before showing what a fool he is, and Bennett pays tribute to Shaw's infernal cleverness as a preliminary to exposing him as a trifler or a falsifier. There has been nothing just like this since the day when, according to the Oxford wit, "Stubbs buttered Freeman, Freeman buttered Stubbs." To this form of grace before meat, used by the battling knights of the pen—kind words about a fellow-author before rending him limb from limb—there is no great objection on the score of mere conventionality, but what does it do for the authority of the literary class? What for its sincerity and dignity? People will be tempted to put the whole thing away as merely one more squabble of the irritable genus.

Concerning the value of their contributions to the literature of the war, judged only by the test of good writing, notable testimony of a negative sort was borne the other day by Professor Sadler of Leeds University. Lecturing before the National Home Reading Union in London, he gave a list of

the memorable things that have been written or spoken during the war. And whom did he single out for mention? Our high-flying men of letters? Not one of them! His bestowal of the prize for literary merit was upon some of the British official dispatches —written in great haste though they were —upon a speech by Mr. Asquith, upon Kitchener's letter to the soldiers, and upon President Wilson's call to prayer for peace. And then this audacious professor of literature added insult to his neglect of the professional writers by affirming that some of the newspaper articles about the war had been of a high order. Think of that! Ranking mere journalistic hacks above the shining lights in the literary sky! After that, it does not surprise one to find Professor Sadler saying of most of the poetry occasioned by the war that it deserved no better fate than to be dismissed with a smile. He remarked that most of the poets who had broken out in verse reminded him of cooks doing rhymes by the kitchen fire when they ought to be getting dinner ready. This was said before Kipling's poem on Lord Roberts was published, but that production—as flat as the Flanders of its scene—could only lead him to make his assertion stronger. He might even recall Scott's unhappy poem about Waterloo, apropos of which it was said that of all who fell by shell or fell by shot, none fell half so flat as Walter Scott.

The whole affair lends itself to flippant treatment, but it has its serious side. A question of moral values, as well as literary, is involved. War too often silences human reason as well as laws; and in war-time every honest workman in letters ought to feel an especial obligation resting upon him to do nothing to confuse the popular mind or to add to the mass of credulity, already and inevitably large. In this aspect of the matter, what can be more reprehensible than for a man like Bernard Shaw to play his verbal tricks with the diplomatic documents of the war, showing either that he has not read them before writing about them, or that he is entirely willing to make of them a nose of wax for his handling? Or, take Mr. H. G. Wells's latest outburst. He declares that if the Germans ever reach England they will be "lynched." What he means is that the civilian population will fire upon them from every house. But, saying nothing about the laws of war in this connection, what is all this but to delude the people about what can really be done to resist a possible German invasion? The whole thing is without dignity and without sobriety. It is well enough to write in time of peace such a skit as Matthew Arnold's "Friendship's Garland"; but a self-respecting literary man will take good heed lest, amid the vast upheavals of passion in days of war, he darken counsel by words without knowledge.

SEEING THE WHEELS GO ROUND.

Of the latest theatrical novelty, a play within a play, the critics have generally remarked that the main idea is not new. One may go as far back as Hamlet or Christopher Sly. The novelty of the present piece is in the thoroughness with which the old method has been applied. The writing of the imagined play constitutes the plot of the real one. The close manner in which the characters and incidents of the two are intertwined supplies the entertainment. There is an important distinction between the older method of putting a stage upon the stage and the modern purpose. In "The Taming of the Shrew" the device is employed to set the machinery of the main play in motion. In "Hamlet" the strolling players set up their stage in order to push forward the action of the principal story. In both instances the intention is to further the original scheme of illusion. But the newer intention is to destroy the illusion of the stage, to reveal the drama as so much copy turned out by a man who makes a living out of writing pieces for the theatre, and to reveal the actor as just an actor.

An example of a play that stands midway between the old and the new type is Arthur Schnitzler's "The Green Cockatoo," which was recently seen in New York in the original German and in a translation. The subject of "The Green Cockatoo" is the subject of "Pagliacci." In both the theme is the blending of the mummer and the man in one person, who is shown as acting in real life and living on the stage. The appeal is to the public's ancient interest in the human being behind the clown, the mountebank who laughs while his heart is aching. Much of the machinery of the theatre is exposed, but for a serious purpose. The interest is in the troubled soul beneath the motley. But in the modern play the interest is in the make-believe aching heart of the mummer. A fairly old example of this is the famous "Zaza," with its scene behind the scenes of a theatre. To the public are shown the mysteries of make-up, the thunder and rain-making machines, and the cynical weariness and disillusion of the actor.

The example set by "Zaza" has been followed until it attains its climax in Messrs. Thomas and Hamilton's "The Big Idea." True, the primitive theatre knew very little of stage accessories and actors' trappings. Without the illusion of lights and distances, acting out his little story in a close circle of bystanders, the early actor nevertheless obtained his effects. Mediæval audiences enjoyed their Mystery Plays none the less because Noah was the familiar Jock the tinsmith of every-day life, and Noah's wife was Wat, the apprentice boy. The fact is that footlights and the mysterious curtain have tended to create the idea of a barrier between actor and audience which does not really exist. The latest innovators in theatrical art have sought a deliberate return to the good-fellowship of the primitive theatre between actor and spectator. Max Reinhardt tried for Oriental atmosphere in "Sumurun" by having his actors walk upon the stage from the auditorium.

It is one thing, however, to say that an audience will not lose its enjoyment by being brought face to face with the machinery of the theatre; it is another to say that the enjoyment it derives has that peculiar quality which we associate with the highest effect of dramatic art. The spectator may laugh, but he will not be carried out of himself. He may be thrilled, but only in the way he is thrilled by a "death-defying" act at the circus. The rounded effect of the true play, in other words, illusion, he will not get. The critics are right in describing this new stagecraft as being in essence vaudeville. It consists in a rapid succession of effects, comic, serious, and unconnected. And there is the danger that, like cheap vaudeville, the abandonment of illusion will be carried to any point for the sake of the laugh obtained by the sudden incongruous emergence of the man from behind the actor.

It is a classic trick in vaudeville for the clog-dancer to stop suddenly and whisper to the audience that he really doesn't enjoy doing it, but that the man in the wings—pointing to the supposed manager—gives him five hundred dollars a week for doing it. The orchestra leader has become an indispensable factor in vaudeville humor. The lady in the upper right-hand box is important. The ushers do their share. This sudden bridging of the footlights is effective enough in vaudeville. It is effective enough for farce. But somehow one feels that the trick is illegitimate and rather cheap. It seems a somewhat desperate resort, this business of getting effects by "giving the show away."

Chronicle of the War

As the war procceds the operations on the two fronts, west and east, are becoming more and more closely related. Interest during the past week has centred almost exclusively in the battle that has been under way in Poland. In France and Flanders the two lines of stone wall have remained virtually intact. There offensive and counter-offensive have resolved themselves almost into a double defensive. On the German side the important part played by artillery in the fighting has been particularly noticeable. The defence is maintained almost exclusively by artillery; offence is preceded by a heavy bombardment; the infantry advance under cover of the guns, and more often than not the final stages of the fight are settled by the bayonet, on which the Allies appear to put great reliance and with which they have been remarkably successful.

The German attacks in their effort to force a way to the cities of the coast have not ceased (there was violent fighting last week to the south and east of Ypres), but they have unquestionably slackened, and the general strategy in the west for the past two weeks has been defensive rather than offensive. There can hardly be a doubt that the explanation of this is that considerable numbers of troops have been taken from this front in order to reinforce the armies in the east, to roll back the threatened invasion of Silesia and Posen, and to undertake a second offensive into Poland. This being so, it might be imagined that Gen. Joffre would consider changing his strategy and adopting a general offensive. We have pointed out more than once in these columns the reasons that we may presume induce him to postpone offensive operations until the early spring, when the numbers of his troops will have been considerably augmented and the terrain will be in a condition more favorable to attack. But even granting the force of these considerations, it would appear on the face of it that the present offered a tempting opportunity to assume a general offensive and endeavor to drive the German armies out of the industrial and mining district of France, their occupation of which lessens appreciably the resources of the country. The Allies, we must presume, at the present moment considerably outnumber the German forces opposed to them, weakened as these have been by the sending of drafts to the eastern front; the pressure on the Russians has been severe and might have been considerably lessened by the adoption of a vigorous offensive by their allies in the west. Why, then, has Gen. Joffre not seized what has appeared to be a favorable opportunity, but has been content to remain on the defensive in his strongly intrenched positions?

The explanation, of course, may be, and very likely is, that even now he does not consider his numerical superiority sufficient to warrant an offensive against the almost impregnable labyrinth of trenches into which the Germans have dug themselves. He may, as we have suggested previously, be convinced that the policy of allowing the German forces to wear themselves out by their own momentum is still the wisest and surest. At the same time one cannot altogether resist the suspicion that this strategy of delay, while entirely sound and calculated in the long run to secure victory, is not a wholly voluntary one. One recalls the warning uttered with amazing frankness by Senator Humbert only a few weeks before the war began as to the unpreparedness of France and the lack of equipment for her army. One knows, too, that when war broke out there was a serious shortage of uniforms and boots. It is not improbable, therefore, that a similar shortage was found in arms and ammunition and general equipment. The factories of the Allies have, we know, been working night and day since the war began turning out military stores and equipment, but these things do not spring forth as it were from an Aaron's rod, and, taking into consideration the enormous wastage of sixteen weeks of war, it is wholly probable that the deficiency has as yet by no means been made good. Gen. Joffre, therefore, has very possibly adopted a strategy that has been forced upon him by circumstances. In attack the expenditure of ammunition and the general wastage of equipment is necessarily enormously greater than in defence. The Germans, with their splendid organization and their avowed plan of strategy, were well prepared at the outset of the war with arms and equipment. The French were not, and Gen. Joffre must wait on the armament factories before he can safely assume the offensive.

The veil of censorship which shut down last week on the operations in Poland has been lifted somewhat, and there appears to be little doubt that the second German advance into Poland, in the direction of Warsaw, has been checked. Indications are that Gen. von Hindenburg has suffered a rather serious defeat. As we write we have only unofficial dispatches to go upon, supplemented by an Exchange Telegraph report of an official communication given out at Petrograd, which announces the retreat of the Germans between the Vistula and the Warthe, from the line running from Strykow to Zgierz, Szadek, Zdunskawola, and Wozniki. That reports of a Russian victory are accurate seems to be confirmed by an official communication from Berlin, which states that "in Poland the appearance of Russian reinforcements is postponing a decision of the battle." Unofficial reports credit the Russians with a decisive victory and the capture of large numbers of prisoners, and state that the Germans are in full retreat towards their own frontier.

We recorded last week the initiation of this new German offensive into Poland. After the rapid retreat from his first advance, which reached the suburbs of Warsaw on October 14, only to be swept back in ten days to the German border, Gen. von Hindenburg re-formed his army, collected reinforcements from East Prussia and from the western front, and by the second week in November was again ready to resume the offensive. The vanguard of the pursuing Russian army, pressing on, apparently overreached itself, was caught by the renewed advance of the Germans, and suffered the defeat which we mentioned last week in the neighborhood of Plock. The recoil of this defeat drove the Russians back again, across the Vistula, in the direction of Kutno, and to a line on the Bzura River, stretching from Lowicz in a southwesterly direction. Warsaw was apparently again threatened, and German outposts are even reported to have penetrated to within thirty miles of the capital.

Meanwhile to the north and south the situation remained virtually unchanged. In East Prussia, Russian troops were well across the border, forming a thin fringe from the neighborhood of Gumbinnen (the capture of which was actually reported but has not been confirmed), southward to Lyck, and southwest to Soldau. In Galicia the Dunajec River had been reached, and in Southwest Poland the lines were drawn for a battle between Czenstochowo and Cracow, which is apparently still in progress as we write. The latter place was, therefore, threatened on two sides, from Poland and from Galicia. The plan of Gen. von Hindenburg's strategy was daring but perilous. Obviously his immediate objective was not, as in his previous advance, Warsaw. His design on this occasion was to drive a wedge into the Russian centre, inflict a defeat upon the army at that point, and then, before the beaten forces could recover themselves, to make a quick swing north or south. If the swing was to the north, he would attack the Russian army in East Prussia on its left flank, and would cut the railway from Warsaw to Mlawa; if to the south, he would cut the railway from Warsaw through Skiernewice and Piotrkow, and fall upon the rear of the Russian forces before Cracow.

The importance which was attached to the success of Gen. von Hindenburg's strategy is made evident by the comments upon it which have appeared in the German press while the battle was going on, but while no news of its progress was forthcoming. The battle was expected to result in a complete German victory, and the opinion was freely expressed that the success of Gen. von Hindenburg's plan would virtually decide the issue of the campaign in Russia. It would at any rate release a large number of troops for service on the western front and enable the German armies there to resume a vigorous offensive, perhaps—who knows?—even to undertake the long-cherished invasion of England. Yet the perils attending the strategy were obvious. For success it depended on the complete defeat of the army opposed to it. In case of failure it contemplated the risk of attack on either flank. Gen. von Hindenburg took a tremendous chance, and apparently the turn of the cards has gone against him. His position must now, if we accept the reports of his defeat, be by no means an enviable one. Nothing remains but a rapid retreat over the route that he has traversed in face of an army already twice victorious. The factor on which the German experts counted to harass the Russian forces in their retreat to the Bzura River—the impracticable Polish roads and the previous destruction of bridges and viaducts—will now hamper the German army. To those same Polish roads we may assume that the Germans, in large measure, owe their defeat, as they have doubtless deprived the army of the use of some of its most effective artillery. The large forty-two-centimetre guns can only follow the line of the railway, and so are out of the question in a campaign in a country like Poland, and even the six-inch howitzers, which are capable of horse or motor traction over the German highways, could hardly be transported over the indifferent Polish roads.

Foreign Correspondence

PRINCE LOUIS OF BATTENBERG—"JACK" FISHER BACK AT THE HELM—LORD CHARLES BERESFORD AND THE KAISER—LADY ABERDEEN AND THE RED CROSS SOCIETY.

By SIR HENRY LUCY.

WESTMINSTER, November 6.

The cabal against Prince Louis of Battenberg, which led to his resignation of the post of First Sea Lord, is generally condemned. The intelligence of those who worked it may be gauged from the fact that they regarded the Prince as a German, whereas he is of mixed birth, his mother being a Pole. However, the assumption was geographically near enough. Regarded from the lowest plane of reasoning, it was foolish to suppose that he would conspire against the country to whose sovereign family he is linked by marriage ties and with whose fortunes his own are indissolubly bound. Not more than common people are princes disposed to quarrel with their bread and butter. The plot having succeeded, Prince Louis has felt bound to sacrifice a cherished salary of £1,500 a year, with a convenient residence in the new Admiralty buildings, on whose roof is limned against the sky a wireless telegraph apparatus which hourly communicates with the fleet in the North Sea or cruisers in more distant waters.

It would be idle to assert that had Prince Louis not been a connection of the royal family he would at the present national crisis have been found at a post whose incumbent virtually directs the business administration of the navy. Short of the exceptional capacity proper to that exalted rank, he is recognized by fellow officers who have worked with him as a capable and trustworthy commander. But his most uncompromising adulator would not compare him with Lord Fisher. There is no question that it is to this great seaman and administrator that the navy owes its present predominance afloat. Lord Fisher created the British navy of to-day, and it is only right that in time of war he should be at its head. His recall to the helm has been greeted with an outburst of national applause that must be gratifying and encouraging to the septuagenarian sailor.

Few men have lived a life of wider experience or fuller range of adventure than Lord Fisher. If he were disposed to imitate his sometime subaltern and unfortunately long-time dissevered friend, Lord Charles Beresford, and write his memoirs, it would be the book of the season. The publishers have persistently kept an eye on him. Two years ago one, chancing to hear that I was going to meet him at his son's country house in Norfolk, begged me to lay the project before him. I did as I was bidden. Lord Fisher shook his head, laughed, and proceeded to tell a new story that would have pleasantly filled up a chapter of the proposed book. Among his gifts he is a marvellous raconteur with an endless fund of stories. I have heard him rattle them out at the dinner table from Friday to Monday, and never caught him repeating himself.

The circumstances under which, upon advance to the peerage, he adopted the title "Lord Fisher of Kilverstone" are interesting and characteristic. When, sixty years ago, he was a midshipman, a gentleman named Vavasour visited his ship and interviewed the Captain with desire to interest him in a patent recently obtained for an improvement in naval gunnery. The Captain was unsympathetic, not to say skeptical. The midshipmite who chanced to be on duty in attendance, perceiving the value of the invention, boldly pointed it out. He was sharply reproved for unseemly interference. But upon reflection the Captain, his eyes opened, saw the value of the new departure. He brought it under the notice of the authorities, and in the end it was adopted by the Admiralty. Messrs. Armstrong recognized its value, and offered to purchase the patent for a colossal sum. Mr. Vavasour stood out for a partnership in the great concern, had it conferred upon him, and retained it to the end of his life.

He never forgot the midshipmite who was the founder of his fortune. When Lord Fisher's son was born he became his godfather, bestowed upon him, among other things, his name, and when he died left him his seat in Norfolk with a big estate and a sum of money ear-marked to build a new mansion more in keeping with its many broad acres.

As appears in the interesting memoirs of Lord Charles Beresford just published, he, through all the years when he was in command, whether of a ship or a fleet, devoted his thoughts and his energies to bring them into fighting form in view of the possibility of war. The strange thing is that the enemies he anticipated were France and Russia, France in the first line of certainty. He never once mentioned Germany as a possible foe, a singular fact since during the last twelve years, when at mess tables and ward-rooms in the German army and navy the toast at the dinner table has nightly been "The Day" (meaning the opportunity of getting at the throat of the hated English, a luxury now enjoyed with fulness if not satisfaction), British officers on land or sea habitually talked of an inevitable war with Germany. Lord Charles was, indeed, a personal friend of the Kaiser, who sedulously paid him court. Whenever his Majesty found himself in contiguity with the breezy Admiral, he paid his ship a friendly visit and was received with almost servile welcome.

Lord Charles gives a graphic description of such a visit paid ten years ago, when he was stationed at Gibraltar in command of the Mediterranean fleet. When the Kaiser came aboard for dinner, his flag as honorary admiral in the Royal Navy was hoisted on the British battleship. Passing from the Imperial yacht to Lord Charles's flagship the Imperial pinnace steamed between the boats of the fleet, which formed a passage. Every boat burned a blue light. All oars were tossed in perfect silence, the midshipmen conveying their orders by signs. "After dinner," says Lord Charles, "when it fell to me to propose his Majesty's health, I stood up, glass in hand. As I said the words 'Emperor of Germany' a rocket went up from the deck above, and at the signal every ship in the fleet fired a royal salute." As the Emperor was leaving, the German flag and the Union Jack were hoisted on the rock, half the searchlights of the fleet being turned on one flag and half on the other.

English society in Ireland, which, as a not unfamiliar indication of exclusive loyalty, has systematically boycotted the wife of the representative of the sovereign, is just now excessively indignant with Lady Aberdeen. Certain journals have published in facsimile a letter Lady Aberdeen is alleged to have addressed to the editor of *Freeman's Journal*, in which the following sentence occurs: "I am afraid there is a bit of a plot among the Unionists to capture the Red Cross Society in Ireland and to run it in such a way from London and through county lieutenants and deputy-lieutenants that it will be unacceptable to the Irish Volunteers' people." Shocked at this suggestion, the Committee of the County Dublin branch of the Red Cross Society wrote calling her Ladyship's attention to the matter. As they justly said, the writer of the letter was made to appear as charging a body of Irishmen and Irish women with seizing the occasion of a great public calamity to use for political purposes a charitable institution supported by public subscription. Lady Aberdeen has in the circumstances declined to be drawn into controversy on the subject, turning with renewed zest to pursuit of those good offices among the Irish people which have endeared her to them in degrees hitherto unknown by a denizen of Dublin Castle.

ITALY'S FUTURE ACTION—THE SALANDRA CABINET BEFORE ITS RECONSTRUCTION—PUBLIC SENTIMENT AND THE GOVERNMENT.

ROME, October 29.

The Italian Government is to-day in the hands of a strong Prime Minister, Salandra, who, though in office but a short time, has won, up to a certain point, the confidence of the majority of the country. But this confidence has a time limit, and it will go hard with him, as the weeks and months pass, if the people are not more fully convinced that at the close of the great conflict Italy's place in Europe will be one of increased dignity and respect. The colonial war in Tripolitania depleted Italy's military stores, and at the outbreak of the present war the army magazines were empty. In the past three months, however, enormous military preparations have been made, and in January the Italian army will be in a state of efficiency. The Terni works alone are manufacturing a thousand rifles a day; a field battery of the new Italian type, *Deport*, said to be superior even to the French *petit cigare*, is turned out every ten days; shiploads of army shoes and clothing have been imported from the United States; within a short time Italy will have spent seven hundred million francs in urgent military preparations. Will it be possible for the Government to go before Parliament and the people to ask for the approval of such an expenditure, which for Italy is enormous, for the simple purpose of remaining inactive and permanently neutral? If not, it is to be borne in mind that for Italy war to-day has one, and only one, meaning—war against Austria.

In a recent article upon Italian neutrality published in the *Nuova Antologia* of Rome, and signed "An ex-Diplomat," it is emphatically stated that the present European war has not arisen from a necessity for Germany and Austria to defend themselves against aggression, and that the provisions of the Triple Alliance requiring Italy to render them assistance are therefore not operative. Furthermore, Austria's fatal note to Servia was communicated to Italy only when it was given out to the press of Europe; in this action, which was the immediate cause of the war, Italy was disregarded by her confederates of the Triple Alliance, who afterwards hastened to demand her aid. The writer declares that in consequence Italy is "free from every obligation,"

and can act to-day "exclusively from the Italian point of view." Salandra, in reply to men who have asked him for a statement of his policy, has referred them to this same article in the *Nuova Antologia* as expressing his opinions.

The Salandra Cabinet is not, however, itself united in its view of Italy's future action. Rubini, Minister of the Treasury, is known to be stubbornly opposed to war, and his resignation, concerning which there have already been rumors, would be regarded outside as a step in advance towards Italy's participation in the European conflict. San Giuliano, Minister of Foreign Affairs, worked in harmony with his colleagues in the Cabinet because all had agreed that in view of the want of preparation in the army neutrality was the only possible policy for the first months. But as San Giuliano was the Minister who signed the last renewal of the Triple Alliance, it would have been harder for him than it would be for a new man to take diplomatic action now leading to war against Austria. His death on October 16 certainly removed one of the obstacles to Italy's abandonment of neutrality, and there is good reason for the belief that his successor, when Salandra gives up the *ad interim* tenure of the office of Minister of Foreign Affairs, must be satisfactory to those in the Cabinet who want war—otherwise, and this is quite possible, the Government will fall. The weakness of Salandra's position lies in the mongrel character of his Cabinet. He is himself of the Conservative Centre, but in order to command a majority in Parliament he was obliged, in the formation of his Ministry, to ask the coöperation of the Radical Left (exclusive of the Socialists), which is represented in the Cabinet by Martini and Ciufelli. Now the Radicals and Republicans have declared openly for war.

To those who oppose war with arguments based upon "the Slav peril," the Radicals reply that the Slav peril is quite as great for the rest of Europe as for Italy, and that it is a distant peril, if indeed a peril at all; whereas the German peril is immediate. The cost of war is the strongest argument of those opposed to it. Some, but not all, of the larger financial interests are working against it. Many merchants in Milan are its opponents because they are making fortunes by importing contraband of war into Italy in their own names, and then evading Italy's prohibition of export by declaring the cargoes *in transit* in the port of Genoa, and carrying them through into Germany. But the country at large is moved by more patriotic motives and by considerations of future national interests; it thinks, moreover, of the unredeemed Italian provinces still under the yoke of Austria—Trieste and the Trentino—and is impatient to free these enslaved Italians from foreign tyranny. The Hungarian manager of extensive estates in Austria wrote not long ago to their foreign proprietor stating that 2,700 citizens had been recently hanged or shot by the Austrian Government in the province. "Quiet subsequently reigned." A similar state of terror exists in Austria's Italian provinces, and patriots in Italy hear there to-day a "cry of anguish" identical to that raised by the Lombardo-Venetian provinces subject to Austria in 1859. The peace which follows the war will endure, it may be hoped, for a half-century. If the unredeemed Italian provinces do not become Italian now, it is not improbable that they will be lost forever. X.

The Altman Collection

By FRANK JEWETT MATHER, Jr.

The Altman collection, which was opened last week at the Metropolitan Museum, is so much the most important gift ever made to an American museum that one is tempted to write of it in superlatives. Yet importance is relative, and one is fain to ask if the Marquand pictures were not a greater accession in their day, and whether, if reassembled, they would not pretty well hold their own with the Altman group. Certainly there is nothing in the Altman collection to compare with the Marquand Vermeer, the Halses, the Van Dyck. The two Marquand Rembrandts would hold their own very well beside the newcomers, but the Altman group of thirteen examples—of which ten should be genuine—is comprehensive, and in two women's portraits contains two very great masterpieces. The two Altman Holbeins are invaluable accessions, for the Museum contained only one early and not very representative example. The Altman Ruysdael is incomparable, so is the early Velasquez, Christ at Emmaus. The Francia portrait of A Gonzaga Boy is the freshest and most joyous thing imaginable. Antonello da Messina's portrait of a youth is of amazing saliency and vivacity. The late Botticelli, The Last Communion of St. Jerome, is as poignant as anything that has come from the master's late and tragic years. The Giorgione portrait is full of fire and restrained pathos, and of utmost delicacy as painting. The Mantegna is instinct with religious austerity, and has tones as of old jade and sardonyx. Thus we have perhaps eight or nine pictures of highest merit in their class, as the unchallengeable benefit of the gift. The Marquand gift had about four of this merit. Extending the view from pure quality to historical importance, such accessions as the Gerard David miniature, Christ Taking Leave of His Mother, the Dürer Virgin with St. Anne, the fantastic Van Orley, the four panels rather hopefully ascribed to Memling, the Vermeer, and Rembrandt's Bathsheba, The Man with the Magnifying Glass, and The Auctioneer, are pictures both delightful and important. Of the fifty pictures about one-third are masterpieces, or nearly that. Surely, few collectors can claim a better ratio of hits, few museums even.

Yet the misses are also rather appalling. And as one wanders through the gallery the conviction grows that there is no wall of pictures so harmonious and uniformly fine as the best cases of Chinese porcelain and cut crystal. Perhaps this is in the nature of things, but Mr. Altman seems never to have acquired the same intimate knowledge of pictures that he had of objects of art. He sought for the best, took the highest professional advice, which alternately served him well and ill. Thus the pictures have nothing personal about them as a group, but represent a working consensus of opinion of dealers and experts which does not do unqualified credit to either class of humanity.

I do not wish to dwell on the reverses of a great and generally successful enterprise. Yet the failures are instructive. All the Halses are of the most superficial quality, and represent him near his worst. The Merry Company is one of the ugliest pictures in the world. It is a comfort to suspect with many critics that it is a modern forgery from the similar Dirk Hals in the Louvre. If the flimsy and over-sentimentalized Pilate and the big, dry head of Hendrickje are by Rembrandt, then, to speak Baconianly, some other man must have painted most of his pictures. And why, again, does a harmless little Lombard panel masquerade as a Filippino Lippi? With the Memlings the case is better; for they are all admirable pictures. The Madonna is of jewel-like blitheness of color, a schoolpiece of enticing quality. The amiable man from the Oppenheim collection surely was not painted in Memling's century, and may well be German. The two Portinari portraits are so fine that no one will quarrel violently with the attribution, which, however, has little to commend it. Karl Voll relegates all four panels to the doubtful list, and there they belong. The Fra Angelico Crucifixion is an impressive echo of his great fresco at St. Marco, but the work seems that of a merely competent scholar.

In the field of Italian sculpture, such gracious masterpieces as the Donatello and the Luca della Robbia Madonna immediately discredit a marble head of about the stolid competence of Bregno, which carries Verrocchio's great name. As for the stucco version of the Bargello Youthful John in sandstone—variously ascribed to Donatello and Desiderio—the antiquity of the Altman example would take a lot of proving. Such rather summary eliminations are necessary before enjoying unqualified masterpieces. Three pictures seem to me of highest value. First, the early Velasquez, Christ at Emmaus. The Spanish master, through sheer probity and rightness of feeling, has done admirably what has been essayed disastrously a thousand times: told a Bible story successfully as a local and contemporary event. How would the revelation at Emmaus have looked in an Andalusian inn? That is the simple theme. The Christ intent on the act breaks bread, a young disciple starts forward with amazed joy, a weather-beaten old disciple gradually and perplexedly grasps the great fact. The very externality of it, the absence of formal pathos, constitutes a sort of nobility. There never was greater fidelity to honest appearance, and honest appearance is enough. The painting is of steel-like perfection, the whole effect extraordinarily alert, yet sober and masculine. It is the high exemplar of this sort of Spanish realism, the realism one knows best in Zurburan.

Two fine late Rembrandts, The Auctioneer and The Man with the Magnifying Glass, Dr. Valentiner has lately identified as portraits of Rembrandt's son Titus. This seems very doubtful to me, for Titus died short of thir-

ty, while these two men, obviously two, and neither like the famous youthful Titus, are palpably middle-aged. It is more important to note that they are both fine interpretations. Rembrandt's portrait of himself seems the ruthless record of a black moment of self-contempt. It is as if he had faced the worst that could be seen or said of his premature decrepitude. The look is harassed and peevish. As a document it is valuable, yet it insists on something one would rather have inferred. It qualifies in a pathetic sense the heroic effigies in the Louvre and in the Frick collection. I doubt if the little Bathsheba quite deserves the eulogistic rhetoric that has been lavished upon her. To be sure, the painting of the central group is exquisite, the revelation of wholesome nude forms in the gloom alluring. There is an undeniable homely faery quality about the thing; it evokes legend. But the group is rather carelessly lost in the space, the accessories are a bit distracting, the indications of distance sleek, thin as painting. There is just a tinge of staginess about it, and one cannot but compare it disadvantageously either with the marvellous Bathsheba of the Louvre or the pearl-like Finding of Moses in the Johnson collection. The portrait of young Titus seems wafted or caressed on to the canvas rather than painted. Its tenderness is almost oversweet.

Of all the Rembrandts the two most remarkable are two portraits of old women, one painted in 1635, the other in 1658. They are masterpieces, respectively, of analytical and synthetic painting. In the earlier portrait all the surfaces are minutely charted and reproduced. Except for the subordination of the costume, the method is minutely topographical. It is amazing that the initial sympathy and curiosity could be maintained through so laborious a process. But that is the magic of all primitive artists, and Rembrandt in this work is a primitive. Nothing but belief in his subject-matter will carry an artist safely through these cumulative labors, and Rembrandt plainly did believe in this fine old dame, self-controlled, wistfully, bravely facing the ordeal of decline. The thing is perfect in character and faultless in painting, in spite of over-cleaning, lovely in its contrast of live blacks with creamy whites. It makes some of the later Rembrandts on the walls, with all their *maitrise* and emphasized pathos, look just a little theatrical and slovenly. But the later method finds its brilliant warrant in spectral vision, called The Old Woman Cutting Her Nails. It might equally as well have been named, as Dr. Valentiner genially hints, The Cumæan Sibyl. How what Maes would have prudently treated on small scale as a genre subject, Rembrandt boldly treats at full scale and with heroic effect, is one of the mysteries. To solve it would be to lay bare the harassed, heroic soul of Rembrandt himself, yet the symbols of what makes an epic figure of this old woman engrossed in a sordid necessary task are plain enough on the canvas.

We have simply so many strong accents, with complete disregard of the specific forms and textures of the smaller surfaces. The thing is reduced to a few large surfaces, if indeed we may apply so static a word to what are quivering dynamic indications of pits that hold shadow and bosses that reflect light. The figure has been reconstructed with a new and personal scale of emphasis. No detail is copied, nothing has value or meaning except in the particular relations conceived for this canvas. The work is not a charting, as in the earlier picture, but a symbolism for something deeply felt and seen chiefly with the inner eye. The old lady of 1635 is, one might say, modelled from the front by the spectator's eye, that goes back along her forms and verifies them; the old lady of 1658 is modelled from behind by the light-impregnated air that comes forward and envelops her. She exists as a vision, and her forms require no verification. Her impressiveness is due largely to the sparseness and emphasis of the method and the concentration of the effect, the poetry is not extraneous or communicable in words, but in the very nature of the vision. I must not labor a very old distinction. Yet a study of these pictures will make vivid certain fundamental truths in artistic expression no less important to be realized because they are old and ticketed truths. It is instructive to see exemplified in the work of a single master the rightness of both methods. It is also encouraging for the future of the synthetic method to see so magnificent a success at its very beginnings. Nor need we stress the obvious fact that the case of Rembrandt shows that to attain synthesis otherwise than through a severe preliminary analysis is the hope of a fool and the programme of a charlatan. If *Rembrandt als Erzieher* means anything, it means this.

Any adequate review of the collection would require several articles. I may now only remark the general high quality of the porcelains. The cases of ox-blood, green, and white are a joy for well-assembled beauties of tone and form. Generally, the installation of the collections is excellent, though the eighteenth-century French sculptures, Houdon, Pigalle, Clodion, and Falconnet, live very ill with the Rembrandts in the large gallery. It is draped in the green velour taken from the Altman house, and thus pleasantly recalls a past that many were sorry to see terminated. Yet it must be admitted that almost without exception the pictures gain from the truer and more abundant light they now have. Of the five galleries the most harmonious is perhaps that in which against deep blue hangings are set the Italian marbles and bronzes, with a few fine bits of majolica and pieces of Renaissance furniture, not to mention precious Eastern rugs and early Brussels tapestry. It is a place that invites to the solace of quiet inspection. More ingenious is the assembling, against a common background of warm mouse color, of the Primitives and seventeenth-century portraits. The hazard is justified by the results, but I doubt if this glorified "limousine" effect, which for the moment is piquant, will wear well.

On the crystals, enamels, and goldsmiths' work of the Renaissance, including the sumptuous Rospigliosi coupe by Benvenuto Cellini, there would be an entire article to write, but the reader is best referred to the excellent illustrated handbook issued by the Museum.

Through the acquisition of the Altman pictures the Metropolitan more than doubles its resources, if the reckoning be made by great pictures. For the first time it approximates the richness of the famous European galleries. It now has to be reckoned with, if not like Paris, Florence, Madrid, London, Berlin, or even Venice and Milan, at least like Kassel or Budapest. This may seem a modest claim, but, without Mr. Altman's generosity, in the present condition of the picture market, it would have taken a generation for the Metropolitan Museum to reach such a position.

Book Notes and Byways

THE SUPPRESSED LEAVES OF HAKLUYT'S "PRINCIPAL NAVIGATIONS."

I suspect that few persons in our day pore over the black-letter folios (or for that matter, the modern reprints) of that prince of documentary historians, Richard Hakluyt. Nevertheless, the perusal of Hakluyt is a diverting business, affording both delight and profit. And though few besides the scholar may read his books, there are fortunately still some who collect them. A bibliographical note, therefore, on the London, 1599-1600, edition of that noble collection, "The Principal Navigations, Voyages, Traffiques and Discoveries of the English Nation," the third (or American) volume of which is one of the foundation stones of our history, will perhaps be of some interest.

The issue of 1599 is the counterpart, page for page, of the edition of 1598, except that from the title-page of Volume I all reference to the "famous victorie atchieued at the citie of Cadiz" is omitted. The account of this exploit occupies pages 607-619 of the 1598 edition; but owing to the disgrace of the Earl of Essex, in 1599, these leaves were suppressed by order of Queen Elizabeth, and the title-page changed. The disgrace of Essex swiftly followed his memorable quarrel with the amiable Elizabeth, who, it is said, slapped the Earl's face.

At a later time, the leaves on Cadiz were reprinted, and are to be found in many copies of the 1599 edition of "The Principal Navigations." In his elaborate and very thorough "Catalogue of Books relating to the Discovery and Early History of North and South America" (forming a part of the library of E. D. Church), Mr. George Watson Cole describes three distinct issues of the voyage to Cadiz, but appears to have been unaware of the fact that two of these are in reality merely reprints, published more than a century and three-quarters after the original. Issue No. 2, as described by Mr. Cole, is printed on paper which bears a watermark dated 1790, and issue No. 3 was probably reprinted about 1778. Mr. Henry N. Stevens, of London, informs me that,

some years ago, there came into the possession of his firm a copy of this so-called third issue on which was written, in a contemporary hand, "From a London catalogue 1778 2sh. 6d." Thus it will be seen that there are not three states of the Cadiz leaves, two being reprints and nothing more.

The suppressed leaves now and then appear in facsimile, but I should say that the reprints are superior and more to be desired. My own copy of this edition of "the prose epic of the modern English nation" contains the account of the voyage to Cadiz reprinted, as there is reason to believe, about 1778.

It is perhaps worth while to add a word concerning the famous map of the world by Emmerie Molineaux, "finished about 1600," and designed to accompany Hakluyt's work. It bears two inscriptions, of which one is, in part, as follows: "Thou hast here (gentle reader) a true hydrographical description of so much of the world as hath beene hetherto discouered, and is comne to our knowledge." The rarity of this map—a copperplate measuring 25⅛ by 16⅞ inches—is so great that only thirteen copies were traced by Mr. Cole. A copy of Hakluyt containing the original Molineaux map realized £375, in 1894, and another was purchased by Henry Stevens, Son & Stiles, London, in 1897, for £275. An excellent facsimile is available, and collectors should not fail to have it inserted in their copies of the 1599-1600 edition of "The Principal Navigations." Capt. A. H. Markham, in his edition of "The Voyages and Works of John Davis, the Navigator" (London, MDCCCLXXX), advances reasons for suspecting that this map is the work of Edward Wright, a well-known mathematician; and Mr. Cole styles it "The so-called Molineaux-Wright map."

JOHN THOMAS LEE.

Madison, Wis.

Correspondence

THE GERMAN POINT OF VIEW.

TO THE EDITOR OF THE NATION:

SIR: As a subscriber to the *Nation* for many years, I beg you to insert some lines in your paper, not to gain the sympathy for our cause, but to state the justice of our standpoint. I have entirely missed in your journal, and also in other American papers, an impartial discussion of the causes of the present war; I find a good deal of wrong information, based on the infamous lies of the English press, and, of course, false conclusions drawn from false premises. Allow me simply to state some facts which were obvious some months ago, and which are now quite forgotten.

The present war originated in the Servian conflict: Austria could no longer tolerate the dangerous agitation in her southern provinces, and Russia found it necessary to protect that kingdom of criminals by force of arms. The mobilization of the Russian army was the signal for the general war, a fact that cannot be denied. But the Servian question was only the occasion that led to the war; the real causes, and, of course, the real responsibilities for the war must be found in the policy of the different states in the last years. You cannot deny that Germany and Austria have constantly worked for the preservation of peace, even at the cost of their own interests. Germany did not profit by the South African war, nor by the Russo-Japanese war, to settle her controversies with England and Russia; Austria kept peace in the time of the Balkan wars and sacrificed great interests to the cause of the European peace. Germany renounced Morocco for the preservation of peace. The German and the Austrian Governments have done all for that cause; they have never had any aggressive tendencies against other nations.

The case is quite different with the Powers of the Entente. Russia, as her prominent writers and statesmen have asserted,* aims at the occupation of Constantinople and at the union of all the Slavonic peoples under the sceptre of the Czar. These aims are absolutely inconsistent with the vital interests of Austria and also of Germany. There you have one real cause underlying the present war. The other one is the desire shared by the majority of the French nation to regain their provinces lost in 1871. This desire was the leading motive of the French policy. And England? Why did England join France and Russia, neglecting, at the same time, very important interests of hers? For the cause of peace? England assured France and Russia of her assistance with the purpose of destroying the German navy, German industry, and German commerce. The Entente, from the beginning, aimed at the very destruction of the Empires of Germany and Austria. By the policy of the Entente Europe was for many years in a constant fear of war. It is a fact that Russia began her mobilization in the spring of this year, and it was told in your own paper that England had made ready for war at the same time. The Servian affair was, as you see, not the real cause of the war; the cause of the war must be found in the aggressive policy of the Entente.

You see by the statement of these simple facts that it is a fable to say that England was going to war for the cause of Belgian neutrality. It is quite certain that France and England had the plan to attack Germany by way of Belgium, and that the Belgian Government had—even before the outbreak of the war—adhered to the Entente. French soldiers were seen in Belgium before the Germans entered the country. Belgium was not a neutral country. Belgium was, before the war, on the side of the Entente. Many lies have been told by our adversaries about the so-called "breach of the Belgian neutrality"; more lies have been told about "German atrocities" committed in Belgium. I suppose that you are now informed about the circumstances under which these so-called "atrocities" were committed: how the Belgians behaved like beasts and murdered and mutilated our brave soldiers in a treacherous way. I hope that you are now informed, likewise, about the Russian atrocities committed in the province of Eastern Prussia, and that you have protested against these barbarous atrocities, not in the least justified by anything. I hope that you have protested, or that you will protest, against the sending of savages of Africa and Asia by the French and the English, who fight "for civilization" with the aid of negroes and Indians!

I confidently trust that the opinions of many Americans will change when they are informed about these matters. It is not my task to tell where American interests lie in the European conflict, but I wish to state some facts relating to this question. To be sure, the United States is interested in the integrity of China and in the maintenance of the open door in this vast region. Germany has the same interests, but what are the interests of Japan and Russia? Some foolish writers have asserted that Germany has had the intention to violate the Monroe Doctrine; it is sure that Germany has never tried to do so, and that Germany does not own an inch of territory in the New World. Our interests in the Western Hemisphere are purely commercial.

The case is quite different with France, and especially with Great Britain. England is, with the United States, by far the greatest Power of the New World, has many possessions and many interests in America, which are not always identical with the interests of the United States. I know very well that the relations of the two "Anglo-Saxon Powers" have been very good in the last years, but who can guarantee that they will be so in the future? The relations of Germany and England were intimate twenty years ago, and it is not more than twenty years since France and England and England and the United States were on the edge of war. Is the absolute hegemony of the English sea-power really in the interest of the United States? And is the hegemony of Russia on the Continent of Europe and Asia consistent with the supreme interests of the United States? Americans may answer these questions for themselves. You will probably tell me that you, also, fear a hegemony of Germany on the European Continent, and perhaps also on the sea. But I think reasonable people will see at once that such hegemony is an utter impossibility. Germany wants to preserve her independence and integrity, Germany wants to be assured against the attacks of envious Powers, but she does not claim the hegemony on the sea, like England, or even the hegemony on the European Continent.

At this moment I receive the *Nation* of September 17, with the excellent article of "Vernon Lee." If many persons in England were so fair as "Vernon Lee," an understanding between the two nations would be possible. There is only one error: Happily there is no danger of famine or starvation in Germany. In the last years Germany has become a rye-exporting country, and in this year our harvest was exceptionally good. I admire the article of "J. H. W." for its florid fantasy. How can a reasonable person think that there is a possibility of reducing Russia or England "to the negligible military status which Spain now occupies"? And how can a reasonable person assert that Germany would attack the United States? We see, with deep regret, that many Americans have such a misconception of the character of the German nation. The Germans are a peaceful nation, who want to live in friendship with the whole world, and cherish especially the friendship of the United States. It is, likewise, an utter misconception to speak of the rule of a "military caste" or a "military despotism" in Germany. Germany is a free country, like England and France; the rule of a military caste and despotism you may find in Russia, but not in Germany. Germany wants, of course, a strong army for her self-defence. The whole German nation, without exception, is quite united in this moment to defend herself. There are no differences of party, rank,

*Read the illuminating article of Professor Mitrofanow in the *Preussische Jahrbücher* of June, 1914. The statements of that Russian professor will convince you of the aims of the "peace-loving" Russians.

or creed; the Germans are, as they never have been before, "a united nation of brethren."

PAUL DARMSTAEDTER.

Göttingen, Germany, October 11.

THE ETHICS OF NEUTRALITY.

TO THE EDITOR OF THE NATION:

SIR: Suppose that one of the belligerent Powers decided as follows: *Every prisoner to be henceforth burnt alive.* Of course, neutrals would protest against such wanton cruelty; but would they think themselves bound by neutrality to do nothing else? I hardly believe that. They would, I hope, send warning to the barbarian, forbidding him to burn his captives and menacing him, in case he did so, with some severe measures of retaliation, such as seizure of ships and goods, imprisonment of his citizens, etc.

I have chosen an extreme case which appeals to everybody. But what about bomb-throwing from airships on undefended towns, useless killing of women and children? Must neutrals look on at such horrors and be content to pray that they will come to a speedy end? I think that in the wicked game which is war fair play can and must be enforced, and I am sure that the enforcement of that *minimum* of humanity means observing the ethics of neutrality.

S. REINACH.

Paris, November 5.

EARL ROBERTS OF KANDAHAR.

TO THE EDITOR OF THE NATION:

SIR: The death, under romantic circumstances, of England's most popular soldier has inevitably brought forth a vast crop of biographical and historical reminiscence, but, curiously enough, of all those I have read, not one has succeeded in suggesting even remotely the real personality of the man. That he was an able soldier, a born leader of men, careless of his life, earnest and sincere, all these things we have heard. But the soldier in Roberts was but a small part, perhaps the least important of the whole. He was emphatically one of those men who are greatest because of the woman that is in them, and by "woman" I mean that he possessed just those qualities of intuition, understanding, and sympathy which are usually regarded as the highest feminine attributes.

In the twentieth century, Roberts for all his intense life, which never flickered even to the last, was something of an anachronism. In the outer virtues he was emphatically a Victorian; in soul he belonged to an age which perhaps never existed, but which has come down to us as the age of chivalry. Sir Galahad and Sir Guy, of Warwick, or, more historically speaking, Bayard and the Cid Campeador, are chiefly admirable, the former because they never existed, the latter because only the unreal parts of their lives have probably come down to us. Bayard was, very likely, in private life a bloodthirsty scoundrel of unpleasant habits—he almost had to be, considering the age in which he lived. He had certain conceptions of military conventions which appealed to his contemporaries, and the merciful fogs of history have done the rest. But Roberts, who lived among us as one of us, did actually strive to live the life of the "chevalier sans peur and sans reproche" and succeeded as well as it is given any man to succeed.

In history he will no doubt live as the great captain of Afghanistan, of South Africa, and a hundred other campaigns, almost as the central point round which revolved half a century of British military history. To those who knew him, however slightly, he will rather be remembered as the little, tender-hearted man-woman, with the kind eyes that understood. I can vouch for at least one unhappy little infantry subaltern of Territorials whom in half a dozen sentences, and without saying anything in particular, he rescued from a position of the most painful mortification—he had clubbed his half-company in the very presence of the great ones of the army. And there is a private from the same battalion who, I think, must have shed tears when he heard that "Bobs" was dead, because Bobs once spoke to him, as he would very proudly recall, "just like it might be you nor me." It was a drab little Cockney life, and any kindness from those in high places would no doubt be remembered as marking an epoch. But it could not have gained a real devotion so easily. That was "Bobs's" secret—or the secret of his eyes.

I never saw Lord Roberts until his fighting days were over, in the field. But he was just as truly the V. C.-deserving lad when his body had reached its eighties. And his all-embracing sympathy, especially for those less fortunately placed, remained with him. Especially was this shown in his attitude towards those reporters, ushers, and doorkeepers with whom he came into fortuitous association when "stumping the country" in his later years. I am not sure that in his last campaign, wherein he sought to arouse England to the danger of her unpreparedness, it did not actually militate against his success. You may defeat a rival general in the field without hating him; you are indeed more likely to win if your passions do not run away with you. But, in these democratic days, you must never omit to abuse your political opponent from the platform; either he is a scoundrel or you are, and if you do not call him what he is, it is a sign that you are what he calls you.

His very real humility, again, militated against his platform success. Because he was notoriously a religious man, of the unquestioning childlike faith that characterized the Victorian Age, he has been compared over and over again to Chinese Gordon. In actual fact, no two men could have been more unlike; you could as well compare Buddha to Mohammed. Like John Nicholson—one of Roberts's heroes by the way—Gordon never admitted that it was possible for the other side to have the rights of the matter; Roberts could never forget it. Roberts could never—as did Nicholson—have made the Hindu chieftain who entered his presence shod, himself remove his shoes and carry them out in his hand as a sign of inferiority. Roberts could appreciate Nicholson's point of view; he would have been too keenly conscious of the Indian's degradation to order it himself. And so it was with Havelock and any of the group of Victorian heroes who held India in Mutiny days; perhaps because he was of a later generation Roberts lacked that dour Covenanting spirit that could cheerfully slay the heathen for the good of their souls. Slay them he could and did, in the cause of duty, but never, I am sure, with enjoyment.

One reason, I imagine, why the army idolized its great chief, was because he possessed to so high a degree the sporting spirit which Mr. Atkins is showing so markedly at the front just now. Not the killing, not even the winning appealed to him so much as the joy of the game. His idea of an ideal war would have been one in which each side, while fighting desperately and performing innumerable deeds of heroism, could part unhurt, ready to fight again next morning. He could appreciate, again, the good points of an enemy, as he showed only a few days before his death, when he publicly appealed to his fellow-countrymen to refrain from "killing Kruger with their mouths" and belittling the heroism of the Germans. We are told that the German press joined with the rest of the world in praising Roberts after his death. If so, it shows that his words did not fall always on stony ground.

Roberts gained many laurels and wore them well; but it will not be as the war-leader that those of us who knew him, however slightly, remember him; rather as the slight, fragile figure in the frock coat of political life, standing very erect and alert, paper of notes in hand, his words almost falling over each other in their eagerness, pounding home the argument to which he gave his last years, yet always kindly, courteous, thoughtful for the feelings of others, so that even those who came to jeer could but stay, if not to praise, at least to admire and sympathize. Roberts's death closes an epoch, that of the Christian soldier as compared with the scientific destroyer. England may find many great generals in years to come; she will be lucky if one of them so truly deserves the epitaph of "a verray parfit gentil knight."

METHODS OF THE NAVY LEAGUE.

TO THE EDITOR OF THE NATION:

SIR: In consequence of a letter of mine appearing in the *Nation* not long ago, asking attention to the probable menace to the United States in case of a complete German-Austrian success in the present war, I received a letter from an officer of the so-called "Navy League of the United States," inviting my interest in its purposes, viz., the building of a strong navy. Along with the letter came a number of pamphlets, setting forth the needs for a strong military and naval force.

One of these pamphlets is a reprint of an article, published in 1911 in the *Nineteenth Century and After*, entitled "God's Test by War," written by one Harold F. Wyatt.

I do not know who that author is. But I wish to call public attention to the perniciousness of the doctrines by which this Navy League seeks to obtain converts. If there is anything in Gen. Bernhardi's book more degradingly materialistic, more sanctimoniously unmoral, more detestably alien to modern civilization, than the principles urged upon us in this pamphlet, I did not find it in the German's book.

Here are a few passages:

"Efficiency for war is God's test of a nation's soul. This is the ethical content of competition."

"Warlike efficiency at the present time is the price of moral and spiritual quality."

"If war could suddenly be rendered henceforth impossible upon earth, the machinery by which national corruption is punished and national virtue rewarded would be ungeared. The higher would cease to supersede the lower."

"While human nature remains what it is at present, war must retain its place beside death as a vital and essential part of the economy of God. The Lord of Hosts has made righteousness the path to victory."

"A spurious and bastard humanitarianism masquerading as religion declares war to be an anachronism and a barbaric sin."

"War remains the means by which, as between nations or races, the universal law that the higher shall supersede the lower shall continue to work."

And with anticipatory imitation of the German Chancellor's morality, there is repeated reference to "bits of paper which are written treaties."

This seems a proper place to express the opinion that the spurious biology and repulsive morality of this pamphlet furnish no fit arguments to win the American people to the purposes of the Navy League. A headnote to the pamphlet warns readers that the League's officers "do not fully endorse all that is in it." But the article has only a single thesis, and the above quotations represent it—the glorification of war as an instrument of righteousness. And the League is knowingly urging that thesis in circulating the pamphlet.

The time seems to have come when this detestable philosophy is seeking to gain a footing on our own shores; and we should unite to avow our repudiation of it.

JOHN H. WIGMORE.

Chicago, November 16.

"DR. GRAVES" AGAIN.

TO THE EDITOR OF THE NATION:

SIR: Mr. Pearson, in one of his delightful articles in the *Nation*, recently spoke of a book called "The Secrets of the German War Office," by "Dr. Armgaard Karl Graves," promising that the reader would find it entertaining, but not, perhaps, authentic. On this commendation, I have read the book, which seems to me to be as hair-raising as Mr. Pearson pronounced it, but which presents some evidences of untrustworthiness that even your critic appears to have overlooked. I mean that more than one hand has shared in its writing and that one of these hands was American. The introductory incidents of the book are written in the style that Mr. E. Phillips Oppenheim and Mr. William Le Queux have made their own, and the rest of the volume is full of Americanisms. "Dr. Graves" tells us that he knows very little of America and a great deal of England; he says that he was used for work in the latter country because of his knowledge of the English of London, but he talks of posing as "a strawberry *fiend*," of doing a "stunt," and of "mailing" (not "posting") a letter! What English-trained speaker of English would write: "Midnight interviews led to some *mighty* unexpected travelling"? Or: "Somebody *says to call* up that number"? One begins to doubt the "Doctor's" boasted cosmopolitanism when his knowledge of Zulu is shown only by his careful translation of the salutation "Koom," familiar to our boyhood delight in Rider Haggard. And *what* is one to think of the valued member of the German Secret Service who answers the Kaiser with a "Yes, sir"? Either the "Doctor" is not quite all that he represents himself to be, or else he has suffered from some very slovenly editing.

Literature

FOX AND THE REVOLUTION.

George the Third and Charles Fox: The Concluding Part of the American Revolution. By the Right Hon. Sir George Otto Trevelyan. Vol. II. New York: Longmans, Green & Co. $2.25.

In measured terms the author assures his readers that this volume was completed before the outbreak of the actual European war, and contains no allusion, direct or covert, to passing events. "The story of the manly and chivalrous spirit in which, four generations ago, the two great English-speaking nations fought out, and ended, their famous quarrel is a story that an Englishman need have no scruple about telling even at a moment when his country, with a steadfast and grounded belief in the justice of his cause, is in the throes of war." He names four of the leaders—Viscount Howe and Sir Guy Carleton, Generals Greene and Washington, two on either side in the contest—who "set a memorable example of how it behooves gallant and humane men to comport themselves under the stress of arms." These forewords, written after the volume was in type, express the spirit of the history. For war and militarism no sympathy is shown; the best side of the leaders' characters are presented, and unfavorable opinions occur but rarely. Gates was "an impostor of a general," and Robertson a dishonest bully. Whether praise or blame is given, the general conclusions are not so extreme as to excite question.

The military events in America after 1780 called for no extended notice. The last campaigns in the Southern States—the running fight between Greene and Cornwallis, and the combined move by French and Americans against Yorktown—are told in sufficient detail, but present no novelty. To Greene the highest praise is given, based upon the admissions of those who suffered defeat at his hands. Yet he never won a battle, nor was he "a general of the first order." A vivid picture of partisan warfare in the Carolinas does not needlessly dwell upon the cruelties practiced and ignores the difficulties imposed upon Greene by the disinclination of too independent leaders to coöperate. French and Americans, Rochambeau and Washington, are commended, and the transfer of sea power for the time gave the victory to independent America. A description of what passed in New York, "the dreary and sordid annals of military government," in which all self-government was denied to the loyalists, explains the slight hold on the country gained by British arms. The officials plundered loyalist as well as rebel. At home the Ministry suppressed a promising inquiry into the conduct of the war, knowing well how far they would stand condemned in an honest and thorough investigation.

Under a notoriously corrupt Ministry, Great Britain had alienated Europe from any sympathy with her contest in the colonies. France and Spain had declared war against her, and Holland was soon to be involved, chiefly through the able and aggressive negotiations of John Adams. The rulers of Prussia and Russia dwelt upon the folly of the contest, and the northern Powers combined in the neutrality league against her sea-power and maritime pretensions. Britain stood alone, challenged by Europe, unprepared for war, and hampered by her costly and ineffective operations in America. The politicians, responsible for bringing the country to such a pass, had remained in full power for six years, deceiving themselves and the people by claiming a strong royalist following in the rebellious colonies, one sufficient to conquer in the end. But after 1780 the true contest was at home, and not in America. Either North and his following must be driven from office, or the empire ruined.

Thus political England offers the most attractive field to the author, and the career of Fox is his principal concern. A Parliamentary as well as administrative experience gives color and weight to his narrative. Here the author is at his best, drawing his material from contemporaneous records with an unerring eye to the picturesque, and interspersing reflections and "characters" as required. He is a strong partisan, and does not spare language in describing the misdeeds of the Bedfords, of Germaine, and of Sandwich. Against them he sets the earlier Ministry of Chatham and the leaders of his successors—Rockingham, Richmond, and Camden. His hero, Fox, supplies the running comment, making a fight of years against the corruption and indifference of the Ministry to the interests of the nation; and later acquiring with Burke and Pitt a strength to compel North to retire. For the wrongheaded King and for North himself the author has some liking, regarding the Minister as sacrificed to an imperious master, whom he could not desert because of his personal obligations to him, and because the political system prevented a reform. So centred was the majority in Parliament in the landed interest, such was the official strength of those who benefited by the war expenditures, and such the influence of the King in obtaining support, that, after six years of open misrule, a new election actually gave the powers of mischief an increased majority.

Taking advantage of the fears awakened by the Gordon riots, the King, without warning to the Opposition, but after carefully providing for his own success, suddenly ordered a dissolution of Parliament. The open purchase of seats, the flagrant bribery and abuse of influence, and, above all, the scandalous acts of Ministerial agents, resulted in a victory for the crown. It was dearly bought, for such as it was the representative system permitted the ablest of the Opposition to obtain seats in Parliament, and emphasized the King's position in seeking to exclude them. Burke, thrown out at Bristol, was returned by one of those pocket bor-

oughs which later served as the best of reasons for abolishing the system. Keppel, defeated at Windsor, was accepted by Surrey. Fox, after a close and exciting contest, carried Westminster. The use of the personal influence of the sovereign turned the Opposition leaders to plans of Parliamentary reform.

The contradictions in the political system of Britain were manifest. We are told that at few periods in the history of the country did so large a proportion of the people keep so jealous, attentive, and intelligent watch upon the course of public events. The press, of which Sir George makes a discriminating use, served to keep the people in ignorance of what occurred, either at home or abroad. Venality controlled the Ministerial papers, and the Opposition sheets knew only what was given out from official sources. The country was ruled by families, and the press by a clique. With a limited following they abounded in libels and abusive insinuation, exerting little direction on public opinion, and exposing in a half-hearted manner the faults of administration. The notorious profits given to placemen and party hacks on the negotiation of a public loan should have made the kingdom resound with denunciation. But Ireland was the silent member of the union, and Scotch politics offered even darker spots than English. Adam Smith showed North new sources of revenue, but did not correct the abuses of the old. A Priestley or a Price could not teach or preach in London, forbidden by old and intolerant laws. When showing great advances in the arts, England numbered few capable men among her rulers.

The restrictions on suffrage made it almost unnecessary to educate the people politically. They had no opportunity to make themselves heard save by petition, and the Opposition recognized their opportunity. The "Yorkshire petition" against the undue increase of the influence of the Crown seemed revolutionary and almost disloyal. Cartwright is drawn from an undeserved forgetfulness as the father of Parliamentary reform. Agitation spread. Shelburne's stroke at the origin of evil—the expenditure of public money—supported by Burke in the Commons, tested the growing weakness of the Ministry; to which the acceptance of Dunning's motion, embodying the Yorkshire petition, gave the final touch. The recognized failure of the campaigns in America, the apprehended approach of national defeat on sea and land, and the unceasing demands for increased taxation, forced North to resign, and with a new Ministry the war with America ceased to have an object, if it ever had one. Personal government by the King stood condemned after a trial of twenty years, and as "turbid and barren a record" as history could show. Of the peace negotiations Sir George does not treat, and the volume terminates abruptly with the entry of the new Ministry into power, with its pledge of peace. On Fox is laid the responsibility for throwing away the victory by refusing to serve under Shelburne.

This series of volumes stands alone as a history of the American War of Independence, at once so careful of the amenities of history, so favorable to the American cause and its leading actors, so unsparing in its criticism of the royal policy and agents, so replete with interesting pictures of English social conditions. The judicious selection of material and the charm of presentation amply compensate for the few errors to be found, such as the double confusion concerning Col. Washington, of Carolina. A reading cannot but lead to a better understanding of the contest between the colonies and the mother country, to a better comprehension of the difficulties Great Britain labored under through the inexpressibly bad system of representation and consequent administration. To the author may be extended a grateful appreciation of his endeavor to show the rights of the matter, and the added wish that he may complete as successfully his history of Charles James Fox.

CURRENT FICTION.

The Wonder-Worker. By Vincent Brown. New York: Brentano's.

This story begins like a play, by letting the reader into the secret:

> This is a story about two old people, their three children, and their fifteen grandchildren. Jacob West was seventy-six. Annie Shard was seventy-five. They lived together as husband and wife since Jacob was nineteen and Annie eighteen. All their friends said they were a very respectable, good-living, dear old couple. They had never been married. Nobody knew.

The wonder-worker, we are rather glad to say, does not appear in the narrative at all. But Jacob and Annie go to hear him preach, and the unconfessed uneasiness about their neglect of ceremony, which has been growing upon each of them, becomes first conviction of sin and then a determination to confess to their children. Meanwhile they have come to believe that several of their acquaintances have in some way discovered their secret. This belief gives rise to the best scenes in the book. The children, who are prosperous people with social ambitions, are not so much scandalized at the fact as alarmed at the possibility that it may be noised abroad. The daughter, in attempting to bribe an old charwoman to secrecy, reveals to her the horrid fact which she has never suspected, and in a similarly gratuitous way betrays it to another acquaintance. But the author, while willing that we should be amused by the antics of the respectable children, also wishes us to take the old people very seriously. Here, in failing to realize the limitations of his material, he has gone astray. For the purposes of farcical comedy it may do very well to assume that two simple and uneducated persons thus informally allied could live happy and unsuspected for fifty years, could then be convinced of their sin, and be induced to explode a bomb in the family by confession. But it will not do to expect the intelligent reader to sympathize keenly with these gray-haired paradoxes, nor to ask him to be present at their wedding in a spirit of reverence.

The Three Sisters. By May Sinclair. New York: The Macmillan Co.

Once, in "The Divine Fire," Miss Sinclair succeeded in telling a story which dealt frankly with spades, but did not make a fetich of them. Her hero, though a genius, was not the familiar weakling of feminine romance; and matters of sex occupied hardly more than their natural place in his young life. Elsewhere this writer seems never to have quite escaped into the wholesome world. Preoccupied with the mysteries of passion, she is as if condemned to find passion, on the whole, more shameful than glorious. "The Helpmate," that inquisitive study of young wifehood, we have always felt should have been called "The Bedfellow"; there was the real plane and point of view. We think of no English phrase to substitute for "The Three Sisters" as a more meaning title for the present story: a Frenchman might have named it "Les Trois Amoureuses."

They are daughters of an English vicar who has been thrice married, and who would be now provided with a fourth spouse if his third wife had not left him by desertion instead of by death. At fifty-seven he is still a sensualist, resentful of his enforced celibacy, and impatient of the happier lot of others. Because his youngest daughter has shown herself susceptible, he has taken them all three to the barren and gloomy village of "Garth in Garthdale." The only marriageable male in the neighborhood is a young physician, and to him the thoughts of the three sisters turn. They are very different thoughts, since the three belong to distinct types—one might say vaguely an Aphrodite, a Demeter, and an Artemis. Alice, the youngest, has inherited a physical need of love. Failing to win the gentleman, she gives herself to a clodhopper, who finally marries her. Gwendolen, the middle sister, yields her proud heart to Dr. Rowcliffe, and she is the one he really loves. But Mary, the elder, has marked him for her own, and, sly and persistent beneath the apparent bounty of her goodness and sweetness, and aided by the wasted magnanimity of Gwendolen, wins her way to be his wife. Then, to clinch her hold upon him, she sets herself to rob him of his virtue—his ambition, energy, self-respect. "She had more pleasure, because she had more confidence, in this lethargic, middle-aged Rowcliffe than in Rowcliffe young and energetic. His youth attracted him to Gwenda and his energy had driven him out of doors. And Mary had set herself, secretly, insidiously, to destroy them. It had taken her seven years." Finally, in his sloth and degeneration of body and spirit, the last shred of his romantic feeling for poor Gwenda visibly ceases to be. So far as he is concerned there is pathos in the situation, but as he is a weakling to begin with, there is

no more than that. Gwenda, the generous and the pure of heart, haplessly compassing her own and her lover's ruin, is the one figure which approaches tragic force.

Kent Knowles: Quahaug. By Joseph C. Lincoln. New York: D. Appleton & Co.

In this book, Mr. Lincoln has deserted his old friends, the sea breezes and the quaint folk of Cape Cod, and has wandered after strange gods—with somewhat questionable results. One is inclined to wonder why he has made England and the Continent the scene of his latest endeavors. The one distinctive figure in the book is Hephzibah, who is obviously reminiscent of the author's former work. The story deals with a writer of "red-blood" romances, who, because of his taciturn disposition, is called "Quahaug" by his neighbors, this appellation being the New England term for "clam." Hephzibah, Quahaug's elderly cousin, is a typical Yankee spinster, of the capable, common-sense type that Mr. Lincoln handles with success. Hephzibah idolizes Quahaug, and the plot centres around the trip they take abroad: the writer, in an effort to get out of the rut into which he has fallen, and Hephzibah, in search of an orphan niece whom she has never seen. The dénouement concerns the finding of this niece and ensuing complications.

Incredible Adventures. By Algernon Blackwood. New York: The Macmillan Co.

The tale of fancy or of supernatural horror, built upon abnormal psychology, which Mr. Blackwood has made his own peculiar field, and to which he brings imagination and a style that lacks only reserve force, here suffers mainly from a want of tangible structure. In long stories the defect of the author's materials is far more apparent than in short. All the narratives are told in the first person; in nearly all the key to the mystifying situation is in the hallucination or aberration of the teller's mind; in nearly all Mr. Blackwood is under the necessity of sustaining a prolonged suspense. There are, hence, whole consecutive pages where the attention wanders, and where eeriness is dissipated through sheer diluteness. Compression is so vital a necessity, in the short story of mystery, as to be atoned for only by complexity of plot. For the rest, the author is as ingenious as ever, as full of poetic fancies, and as refreshingly original in his treatment of the unseen world. One story is of a youth wanting in vitality, who recovers himself through an unusual experience; another is of a man hurt in the Alps and carried to a house on the site of an old château, where he relapses, in delirium, into some of the experiences of the château's inmates during the Napoleonic wars; a third, where the horror is exaggerated beyond good taste, is of the atmosphere of an old house, lived in by generations of damnation-preachers. Restraint would come to the author with more attention to dramatic outline.

The Gilded Chrysalis. By Gertrude Pahlow. New York: Duffield & Co.

If there is an American university town with such an academic personnel, such methods of discipline, and such social manners as are here alleged, it might conceivably tolerate a faculty wife like Cicely. It would regard as inherently charming, though discomposing, the fair newcomer, who in her bridal months runs her husband into debt, insults his friends, flirts with his pupils, and (most crucial test of all) alienates a prospective benefactor of the University. Cicely's creator evidently thinks her delightful though erring, and it may be that feminine readers will be found to share the opinion. To the rough male intelligence she is, to put it brutally, a disagreeable little cat in need of nothing so much as the broom-handle. Her escapades with an undergraduate whom she deliciously calls "Pancakes" and who with equal humor addresses her as "Nuts," though technically blameless, show her in top form. When the patient, not to say fatuous, husband finally turns, her deep love for him is suddenly revealed to her with her own unworthiness, and she runs away, having bestowed the traditional caresses upon his pillow and shooting-coat. That she comes back in due time, penitent and to be forgiven, goes without saying. The action is liberally decorated with that form of facetious dialogue known in knitting circles as "bright."

ORGANIZED LABOR IN AMERICA.

American Labor Unions. By Helen Marot. New York: Henry Holt & Co. $1.25 net.

Helen Marot's book contains a good deal of information on labor organization generally as it exists in the United States and will be useful to those who have not already an intimate acquaintance with the subject. As she says in her preface, she has tried to interpret the nature and purpose of each of the principal organized groups, writing not as a critic nor as an advocate (though her own sympathies are plainly disclosed at times), but as an observer and reporter. She expressly disclaims speaking for any particular group or wing. In this sense her book is more or less impartial. Its peculiar value to the general reader is probably in just what the author argues for it, namely, its interpretative character. In her pages organized labor speaks for itself with more frankness than usual, and it is always important in any matter of this kind to apprehend (and comprehend) the point of view.

Three main groups are distinguished in the general body of organized labor in America: the American Federation of Labor, the railway brotherhoods, and the I. W. W. The American Federation stands for the general principle of partnership relations between labor and capital, and also for what may be called a community of labor interests, while the railway brotherhoods, accepting this principle of partnership, have adopted a thoroughly exclusive policy so far as other labor interests are concerned and are not members of the Federation. The I. W. W. rejects *in toto* the notion of any partnership between labor and capital, and stands for complete economic revolution by dispossession of capital. It is in fact the simplest form of syndicalism. Besides these broad lines of distinction there is another, viz., that which divides the "craft union" from the "industrial" union. Broadly speaking, the latter form bears the same relation to the former that is borne by the "integrated" industry to the ordinary craft. The United Mine Workers (coal), the Western Federation of Miners (metals), and the Brewery Workers' Union are the principal examples of the "industrial" type: all three are members of the Federation. The author regards this type of union as more "sophisticated" than the craft union, and therefore better corresponding to present-day conditions.

In one sense, there is a radical difference between the "partnership" theory of labor organization and the syndicalist theory, but the description given of the point of view of organized labor—what, indeed, might be termed the soul of the labor movement today—makes it reasonably clear that in practice the entire movement is at the bottom revolutionary in tendency. This is stated in terms in the author's preface:

> There is no question of rivalry between the reform movements and the labor unions . . . many movements of national scope operate without crossing. But the difference between labor's activity in its own behalf and the activity of others in labor's interest is not only a matter of results. Immediate results may be served in either case, but whenever labor attacks the evils which beset it, *new power is created* . . . no one doubts that measures for industrial betterment, as they are initiated by philanthropists or by capital and administered by experts or state officials, will make large contributions towards minimizing physical waste and disease in modern industry. It is indeed a movement for sanitation and conservation. Its full realization would give clean homes, healthy children, and efficient workers. But class-conscious labor wants much more. It wants citizenship in industry. It is no more willing to submit to the rule of the beneficent and efficient than were the American colonists willing to submit to the rule of the British Parliament. Labor would rather be free than clean. The reform movement is not co-extensive with democracy, but with bureaucracy. The labor unions are group efforts in the direction of democracy (pp. 8-10).

All through her discussion of matters like the boycott, sabotage, and violence the author makes it clear that between the existing order and organized labor there is an irrepressible conflict, although in her statements of the labor theory on these matters there is not the frankness of admission that characterizes the utterances of extremists of the type of Haywood. It is, however, probably fair to say that she regards as the final ethical test of these things the value that they have as tending to advance the interests of labor as such. Of violence, for instance, she says: "The conviction of union men is that violence does not meet the oc-

easion, not that the occasion does not justify it" (p. 198). Of the courts she says that "labor's particular quarrel with the courts is that they refuse to take motives into account or provocations for coercion; that courts are incompetent to distinguish between acts which are inspired by selfish interests and acts which result from efforts to settle issues of social significance . . ." etc. (pp. 181-2). All this may be regarded as the contribution of revolutionary Socialism to the labor movement in general. It may be that Helen Marot overstates the extent to which the revolutionary idea has permeated organized labor's consciousness, but there can be little doubt that it is in complete possession of its sub-consciousness. Because her book shows this more clearly than have the books of most other writers who are not professedly Socialist in their leanings, it is of especial interest.

SOCIETY AMONG DIPLOMATS.

The Sunny Side of Diplomatic Life, 1875-1912. By Lillie de Hegermann-Lindencrone. New York: Harper & Brothers. $2 net.

A volume made up of extracts from the private correspondence of a clever woman, covering a period of thirty-seven years spent at various capitals, could hardly fail to be an interesting human document. This one will have a peculiar attraction for readers old enough to recall the career of the Miss Greenough, of Cambridge, Mass., who studied singing under Garcia, achieved a notable artistic success in Paris while living there with her first husband, Charles Moulton, and after his death married Johan de Hegermann-Lindencrone, of the Danish foreign service. The fragmentary record carries us from Minister Hegermann's first billet, at Washington towards the close of Grant's Administration, to Rome, Stockholm, Paris, and Berlin, where he reached the legal age of retirement. In the opinion of his wife, obviously, the sunny side of diplomatic life is its social side, and this lends itself readily to the gossipy method of her letters.

As a music-lover, Mme. Hegermann naturally found most enjoyment in her stay at the Italian court under the reign of King Humbert. Queen Margherita was a devoted amateur in music, and used to sing duets with her. Here, too, she met many musical geniuses, including Verdi, who struck her as abnormally self-contained, and whose "very interesting face with burning eyes" surprised her by not glowing perceptibly when she told him how much the Queen admired his operas. Another visitor was Liszt, tirelessly watched over by an unseen and unnamed guardian angel of the gentler sex, who saw to it that he should not be allowed to sit in a draught, or smoke too strong a cigar, or drink any but weak coffee lest it interfere with his sleep. An old acquaintance was renewed with Massenet, whom Mme. Hegermann had helped in his days of penniless obscurity by paying him five francs an hour for copying manuscript, but whom all the fashionable world was now paying twenty francs for the privilege of merely looking at him.

We are treated to a touching story of Mascagni and the first production of his "Cavalleria." The audience, having had no foretaste of the work and knowing nothing of its source, were enchanted with the overture and grew more and more enthusiastic as the performance proceeded, presently calling in excited tones for the author. Mascagni was pushed forward from the wings, evidently against his will, shabbily attired in an old gray suit with the trousers turned up, just as he had come in from the street. His hair was long and unkempt, and his unwashed face haggard from starvation. He was but twenty years old, and with his girl-wife and baby had been living in a garret without money enough to buy a candle, and with no instrument but an accordion on which to work out his score. His awkward bows seemed to arouse his audience still further, so that they rose with a bound and cheered vociferously, their delight bursting all restraints when the intermezzo was played, and compelling him to come before the curtain at least twenty times. "Any other composer," writes our sympathetic witness, "would have beamed all over with joy and pride at such an ovation, but Mascagni only looked shy and bewildered. The tears rolled down my cheeks as I looked at the poor young fellow, who probably that very morning was wondering how he could provide food for his wife and baby."

Among the literary celebrities drawn to Rome about this time were Ibsen and the romancer best known by her pen-name, Ouida. Ibsen, "with his lion face and tangle of hair," his piercing, critical eyes looking forth from under bushy brows, and "his cruel, satirical smile," made a rather disagreeable impression on Mme. Hegermann; he did not like music, and did not disguise his dislike, so that his presence at studio teas where music formed a part of the entertainment took all the spirit out of the performers. Ouida struck her as somewhat of a *poseuse*. "She was dressed with a lofty disregard of Roman climate," wearing a gown "open at the throat, with short sleeves, and the thinnest of shoes and stockings, which she managed to show more than was quite necessary. She spoke in an affected voice, and looked about her continually, as if people were watching her and taking notes."

Not all the interesting figures in this Roman panorama were musicians or writers. One was the then youthful Kaiser Wilhelm II, just raised to the throne by the death of his father, and now making a round of friendly visits to his brother sovereigns. Our author found him a genial soul, with a sporting spirit which stood the test well when the German Minister—a happy bachelor with no talent for housekeeping—put him up at the legation in a room which boasted neither soap-dish nor towel. In a later period Mme. Hegermann saw a good deal of him at Berlin, where he continued to please her by his preference for speaking English, and by such evidences of a cheerful temper as his endurance of an underbred American woman who volunteered her advice that he ingratiate himself with the French people by giving Alsace-Lorraine back to them! He had, we are told, "a way of fixing those discerning gray eyes on you when he talks, and you have the feeling that he is sifting and weighing you in his mind; and when he smiles his face lights up with humor and interest. You feel as if a life-buoy were keeping you afloat." Theodore Roosevelt came to Berlin while the Hegermanns were there. The Kaiser "was charmed with him, just as Mr. Roosevelt was charmed with the Kaiser." There is a familiar note in the account of the reception given in honor of the ex-President at the American Embassy, where he "was most amiable. He greeted people with a cordiality which bordered on *épanchement*, giving their hands a shaking the like of which they had never had before." He "smiled kindly at the guests as they poured in and out of the salon. It was about all the guests did—pour in and pour out."

Intimate pictures of the domestic life of several royalties are sprinkled through the book. The pleasantest, perhaps, is the glimpse we get of King Christian IX of Denmark, known to an earlier generation as "the grandpapa of Europe," and his good Queen Louise. Albeit the King tried to excuse himself by pleading a twinge of lumbago when the Queen first sent for him to come and meet Mme. Hegermann, he soon fell so under the fascination of her singing that he took down a life-size oil portrait of himself which had long hung on the wall of his room, and brought it to her in his arms, dust and all, to beg her acceptance of it as a souvenir. The old gentleman even waltzed with her. Not less appreciative, but more labored in his way of expressing his sentiment, she found King Oscar during her sojourn in Stockholm. He appears to have been fond of singing himself, as well as of listening to other experts in the art; and when he had notified her of his intention to come and sing for her, and she had had her piano especially tuned for the occasion, what was her surprise to see a van draw up at her door and discharge his Majesty's private piano! The mystery was explained when she discovered that this instrument had a shift-apparatus by which one could "lower the whole keyboard by half-tones, so that a baritone could masquerade as a tenor . . . and no one would be the wiser."

The simplicity of high official life in the Washington of the 'seventies, by comparison with the ceremoniousness of foreign capitals, is illustrated by an account of Minister Hegermann's presentation to President Grant. Attired in his red gala uniform, with all his decorations, he drove to the White House, and mounted the steps with his written speech, nicely folded, in his hand. Instead of being received at the door by a bevy of gorgeous chamberlains, he found there a negro, who, on seeing him, hurriedly

donned a coat and, with an encouraging wave of the hand, said: "Come right along in, sir. I'll let them know you're here, sir." He was shown into a room where he waited patiently till the President and Secretary Fish appeared. Grant was dressed in a gray street suit and wore a colored tie, and Fish, who had evidently just come in from a walk, was in equally unconventional costume. The new Minister delivered his speech, and the President responded by reading, with some difficulty, a paper the Secretary handed him at the last moment. Then Minister and President shook hands, the Secretary ventured a remark about the beauty of the weather, and the momentous formality was over. At White House dinners she attended during Grant's term, Mme. Hegermann noted that, though wine was served, Grant turned down his glasses; but that Mr. and Mrs. Hayes, though averse to the use of wine at such functions, took very kindly to Roman punch because it was eaten with a spoon.

It is a pity that a book so full of good things should have its surface marred by errors which could have been avoided by a little care in editing or proofreading. For an American writer to imprison Carl Schurz at Schandau, and introduce "Old Probabilities" as Gen. Meyer, is scarcely less culpable than for a Dane by marriage to refer to a duel between Hamlet and Polonius; and these instances are, unhappily, only typical.

Notes

E. P. Dutton & Company announce for publication in their Times Series, this month, "Some French Cathedrals" and "A Dickens Pilgrimage." The same house will publish shortly "Builder and Blunderer," by George Saunders.

Two new handbooks of the series entitled "Principles and Methods of Religious Education" are announced by the University of Chicago Press: "Graded Social Service for the Sunday School," by William Norman Hutchins, and "The Sunday-School Building and Its Euipment," by Herbert Francis Evans.

G. P. Putnam's Sons have ready for immediate publication "In the Supreme Court of Civilization: The Dual Alliance vs. the Triple Entente," by James M. Beck, and "Deutschland über Alles," by John Jay Chapman.

Benziger Brothers announce the publication of "Rambles in Catholic Lands," by the Rev. Michael Barrett.

"A Tale from the Rainbow Land," by Katherine M. Yates, will be published next month by Paul Elder & Company.

Harper & Brothers announce the publication of "Twilight Sleep," by Henry Smith Williams, and "The Bible and Modern Life," by Joseph S. Auerbach.

Houghton Mifflin Company announces the publication of the following volumes: "On the Cosmic Relations," by Henry Holt; "Civilization and Health," by Woods Hutchinson; "Animal Experimentation and Medical Progress," by W. W. Keen; "The Early Life of Mr. Man," written and illustrated by E. Boyd Smith; "A Century's Change in Religion," by George Harris; "The Grand Tour in the Eighteenth Century," by William E. Mead; "Biology and Social Problems," by George Howard Parker; "Songs of the Outlands," by Henry Herbert Knibbs; "The Boston Symphony Orchestra," by M. A. DeWolfe Howe.

Prof. Albert Bushnell Hart, in "The War in Europe" (Appleton; $1 net), has produced an excellent historical, statistical, and military commentary. He goes briefly into the political, racial, and commercial rivalries that underlie the war, discusses the diplomatic preliminaries, methods of recruiting and fighting, possible effects in redistribution of territory. It is an exposition rather than an argument, though the author does not hesitate to declare that nothing can justify the worst of the havoc wrought in Belgium. On the whole, he seems to regard the war as based on long-standing racial animosities and conflicts of interest; hence as unavoidable. From the suddenness of the conflagration and the speed with which modern war is conducted he draws the lesson that the United States should considerably increase its army and navy. His remedy for future wars is the much mooted one of an international coalition, with small armies which could be united to form a world police. The tone of the book is generally so sober and objective that one reads with some misgivings such prophecies as that no nation but Russia can fight for more than two years. It would be interesting to inquire if any nation has ever stopped fighting just because of shortage of money. Again, to read that "Any day may bring the news that the feat of destroying the English sea power has been accomplished" (through a Zeppelin raid) suggests rather an active imagination than a cool calculation of the probabilities. If it were as easy as that, there would now be no British fleet. Of course, the very magnitude of the war tempts to such forecasts. Generally Professor Hart's book is free from such blemishes. It is well packed with accurate information clearly conveyed, and is just about what the traditional intelligent reader will want to have at hand as he reads his papers. The tabulation of much of the statistical material and the addition of a map or two would have made the book still more useful.

From George H. Doran Company come three slender volumes ($1 net each) dealing with the British, the German, and the French armies "from within." E. Charles Vivian, on the British army, has produced an excellent little manual. It is written with apparent fulness of knowledge, and with an evidently sincere desire to convey information. It takes up Tommy Atkins in the recruiting office and carries him through the routine of the various branches of the service in a systematic, complete, and eminently readable fashion. "Ex-Trooper," who writes on the army of France," displays far less intimate knowledge of his subject. Now and then he gives us a bit of local color, but as a whole his account deals in generalities which might be true of any army; the exception being a fair amount of data regarding organization such as is available in any reference book. The author lays stress on the prevalence of punishment as part of the French soldier's training, which is contrary to the general impression of the relations existing between the French conscript and his officers. The volume on the German army written by a British officer who has served under the Kaiser is worthless. It is made up almost entirely of dubious anecdote, the "information" it conveys is full of errors, and the spirit in which it is written is enough to discredit it, being one of cheap sneers at the army it is supposed to describe and the nation behind that army. The book was evidently written to tickle a certain kind of public taste in England.

There is something self-conscious about the efforts or experiments of the present day in colonization attempted by powers that are "new at the game." The burden of past and present criticism seems to sit heavily upon them, now that the old traditions that led England, France, Holland, Spain, and Portugal far afield in quest of empire have undergone a thorough change. Something of this alert, sensitive paternalism characterizes the Italian adventure in Tripoli as described in Ethel Braun's "The New Tripoli" (London: Fisher Unwin; 10s. 6d.). And especially sensitive an up-to-date modern nation must be when she supplants an historic dependency of the Sublime Porte! The efforts of the Italians in Tripoli are sympathetically described, but one is disappointed to find, with all of Mrs. Braun's wealth of shrewd observation of the natives and their customs, that she has offered under a chapter entitled The Political Situation a mere hint of what her readers would like to know. It is interesting to hear that "Tripolitania has not been annexed to the kingdom of Italy, but has only been put under its dominion . . . the natives of Tripolitania are not Italian citizens, but merely Italian subjects, and Italian laws are not applied in the colony," but some definite notion of Italy's political commitment in the matter would have been more to the point. Granted that the fanaticism of the Mohammedan religion calls for infinite tact by the administration, yet a frank acceptance of native talent, an impartial respect for custom and religion, as shown in the British policy in India, and the admission of the native to a part in the organization of a new régime, would appear to be the surest policy for the Italians. The Mohammedan sentimentally dominated from Constantinople is a type that exists only in Egypt, an academic type that is not even found in India, and a bold attempt to rehabilitate local race consciousness, is one that Italy will find inevitable in gaining control of the religious problem, and knitting together political allegiance. Mrs. Braun, everywhere observant of ethnic differences, is especially illuminating on the Berbers, but notably reticent on the Senussian influences pervading the outlying desert tribes. Tripoli was once a centre for Senussian activity; and, at one time, the Sultan feared the Sheik would rival his authority in Tripoli. We must regard Mrs. Braun's brief survey as a good preliminary to a more ambitious study of Italy's new colony.

Students of English literature are probably less likely to remember Richard Beauchamp, Earl of Warwick, the father-in-law of the kingmaker, as the player of a minor rôle in several of the "Henry" plays than as the romantic knight, the hero of a three days' tournament at Calais, in whose service, it has been very plausibly conjectured, was Sir Thomas

Malory. The great earl, known as the "Father of Courtesy" by virtue of a glowing compliment paid him by the Emperor Sigismund, lived a busy life; fighting and feasting "in Lettowe and in Ruce"; piously journeying to the Holy Land, where he was amiably received by the Soldan because of his descent from Guy of Warwick; serving his King, Henry V, as general and governor; negotiating for him a marriage with Katharine of France, and acting as "maister" to their infant son. Some forty or fifty years after his death in 1439 a series of fifty-three spirited drawings were executed by an unknown, but presumably English, hand, presenting the pageant of this busy life from birth to death. These pictures, obtainable hitherto only in the imperfect engravings of Strutt and the very limited edition for the Roxburghe Club, are now made accessible in a series of photo-engravings from the original MS., together with interesting comment by the editors, Viscount Dillon and W. H. St. John Hope (Longmans, Green; $7). The drawing is animated to a remarkable degree, yet executed with careful attention to detail, and in the successive scenes of baptisms, marriages, crownings, jousts, battles, pilgrimages, sea fights, feasts, councils, embassies, sieges, even the chambers of birth and death, all the bravery and splendor of the fifteenth century in its habit as it lived passes before the eye.

The erstwhile supremacy of the Jesuits in matters educational lends a kind of melancholy interest to "Teacher and Teaching" (Longmans, Green; $1 net), by Richard H. Tierney, S.J. The fourteen essays here elegantly reprinted from *America* deal with both practical and pedagogical features of a teacher's labors, in an admirably simple and direct style. A shrewd and experienced teacher, devoted to his task, he displays a preoccupation with the building of character which is unfortunately rare in the public schools of our country. His suggestions, however, are too vague and general, and where most sensible are least new. Indeed, freshness or progressiveness is the last quality one would remark upon in these pages. The psychology assumed throughout is the theory of faculties, long since discarded by all scientific students. The basis posited for intellectual training is the doctrine of formal discipline for some time now discredited by pedagogical authorities. And the references to boyish modes of thought and feeling disclose the old-fashioned supposition that youthful capacities are of only two or three kinds. Scientific study of education has of late years emphasized the wide diversity of aptitudes and the necessity of suiting the instruction to varying abilities. In brief, the fundamental assumptions throughout the volume are not merely conservative, but those of a past generation.

Prof. F. Crawford Burkitt's "Jewish and Christian Apocalypses" (Oxford University Press; 3s. net) is a useful contribution to the history of these works, the interest in which has of late been constantly growing. The modest volume (one of the Schweich Lectures, price 3s. a volume) is not a translation or a detailed criticism, but a brief sketch of the nature of the apocalypse (the central idea in which Burkitt takes to be the final general judgment), with outlines of the several books and critical remarks in three appendices. The tone of the book is sane and judicial. The occasional references to a connection between the Jewish Apocalypses and the New Testament are well put. Special attention is paid to the book (or books) of Enoch, as to which, and as to the "Testaments of the Twelve Patriarchs," the author dissents from the conclusions of Dr. Charles in a number of cases.

The extent to which development of the educational side of trade, commerce, and industry is receiving impetus from purely academic sources is again made manifest by a book from the pen of Prof. Paul H. Neystrom, assistant professor of political economy at the University of Wisconsin. The book is entitled "Retail Selling and Store Management" (Appleton; $1.50 net), and is the first volume in a Commercial Education series prepared by the Extension Division of the University. As the volume is primarily a textbook, Professor Neystrom begins with first principles, discussing production, retailing, training of clerks and salesmen, and so on, in the simplest terms. He devotes considerable space to personal habits, character, and requisite qualities, and goes into detail regarding knowledge of goods and customers, devoting two chapters to the psychology of selling and the observation and analysis of human nature. Window and store display, newspaper advertising, and other aids to selling are discussed sufficiently to indicate their importance. The book thus furnishes a good grounding for the student salesman, or for retailers who wish to know what training to give their people. At the same time, the larger subjects of policy and general store efficiency in management, organization, standards, selecting employees, buying, credits, and collections are not overlooked. In common with the majority of business men and business treatises, Professor Neystrom's volume fails to emphasize sufficiently the importance of market study, which implies thorough investigation, study, and analysis of the entire zone of delivery, estimate of the possible volume of business, methods of determining who are the individuals that fail to patronize the store, why they do not, and what will attract them, and so on. In other words, the author deals mainly with customers, salesmen, and executives inside the store, and less with the relation of the store to the community upon which it is dependent.

Professor Haverfield's "Ancient Town-Planning" (Oxford: Clarendon Press; 6s. net), though it was submitted in part to the Conference on Town-Planning, held at London in 1910, is likely to prove more instructive to classical scholars and historians than to those "women and men" who have included in their programmes of social reform "the daily life of human beings in their domestic environment." For to them the most it can offer is a successful attempt to show "the slow and painful steps by which mankind became at last able to plan towns as units, yet inhabited by individual men and women," and to "emphasize the need for definite rules and principles" as a restraint upon the vagaries of individual caprice and convenience. To the others, and, indeed, for that matter to mediæval scholars and historians as well, it brings a rich store of information and suggestion. In Greece systematic town-planning first became established in the military foundations of the Macedonian epoch. In Italy approximately rectangular schemes are observable from a very early time (terremare, Marzobotto), but it was only under Greek influence and the necessity of planting military colonies in large numbers that the Romans corrected, in late republican times, the native Italian tendency to operate with trapezoids, or squares and oblongs, "so to say, askew."

The result was a compromise on a type which "has obvious analogies with earlier Italy and with the town-planning of the Greek world, but is also in certain respects distinct from either. The town areas with which we have now to deal are small sq
or oblongs; they are divided by two main streets into four parts and by other and parallel streets into square or oblong house blocks ('insulæ'), and the rectangular scheme is carried through with some geometric precision. The two main streets appear to follow some method of orientation connected with augural science." This new type is visible still in the street systems of several modern towns, particularly in North Italy (Turin, Aosta, Florence, Lucca). It may be induced from the sites of Italian colonies excavated in the Latin part of the Roman Empire (Timgad, Carthage, Laibach, Numantia, Lincoln). Interesting cases are those of native towns in Britain (Silchester, Cærwent), where the rectangular streets of the Romans were shoved through the haphazard collection of farmhouses with which the aborigines had been satisfied. In Autun Augustus seems to have prepared in advance a model Roman city for the Celtic inhabitants of the neighborhood, thus anticipating the decoy streets and houses so common on this continent. The book is illustrated by excellent plans of all the towns discussed. We note the absence of any reference to Delos, where town-planning was, indeed, conspicuously lacking, but where indications are not wanting of a skilful adaptation of street systems to local conditions.

"The French Revolution" (McClurg; $1), by H. Packwood Adams, is a clear-cut elementary account of the great movement for liberty and equality between 1789 and 1795. The author does not pretend to any researches of his own, but relies largely on the writings of Aulard and Sorel and on the "Cambridge Modern History." He is interested in the French Revolution as alive with problems of political freedom and economic justice which are still vital to-day. His own sympathies, and his reading of Kropotkin's "The Great French Revolution," lead him to a somewhat more radical attitude than is found in the sketches of the Revolution by Mrs. Gardiner, Shaler Mathews, and R. M. Johnston. A much more considerable volume on the same subject, but of quite a different character, is Harold F. B. Wheeler's "The French Revolution from the Age of Louis XIV to the Coming of Napoleon" (Stokes; $2.50 net). In order to give the proper background for an understanding of the great changes which began with the Meeting of the States General, the author devotes more than a third of his volume to a good sketch of the germs of decay and the development of criticism and unrest with which France was struggling before 1789. The dramatic side of the Revolution itself is told with something of the dash of modern journalism. The author freely quotes apt accounts of the more vivid and trustworthy eyewitnesses and contemporary sources. But he makes no attempt at constructive criticism, offers nothing startlingly new, and is not free from minor inaccuracies. He gives relatively little attention to constitutional, economic, and social matters. His interesting, spirited vol-

ume is to be read for pleasure rather than conned for information. It is well illustrated by some four-score authentic portraits, caricatures, and miscellaneous pictures of real historical value.

There will always be a legitimate place for brief biographies of the Presidents, but to such a compilation as James Grant Wilson's "Presidents of the United States" (Scribner; $7.50 net) cannot be given very high praise. The twenty-seven sketches which fill these four volumes are by various authors, and have even more various merits. Those of the earlier Presidents are reprinted from Appleton's "Cyclopædia of American Biography," where they served in their day a useful purpose; but the slight revision to which the editor has subjected them has not sufficed to bring them up to date, while in several instances the articles were hardly worth reproducing at all. No American historian, for example, could have been less qualified by knowledge or temperament for writing about Jackson than John Fiske; to which must be added the fact that the works of Catterall, MacDonald, McMaster, and Bassett, all published since Fiske wrote, have quite restated both the events and the significance of Jackson's reign. We may still accept Gilman's estimate of Monroe or John Hay's opinion of Lincoln, but the present generation needs a more authoritative biographer than Fiske, again, of John Quincy Adams, and more impartial ones of Jefferson than Parton, or of Buchanan than Curtis. Of the recent Presidents the treatment is better, for while the accounts of McKinley, Roosevelt, and Taft tend, not unnaturally, to kindly and harmless panegyric, they have at least the value of useful and readable summaries. A quantity of election statistics drawn from the *World Almanac,* together with a list of Cabinet officers, helps out the fourth volume. Few of the portraits are good, while those of the wives of the Presidents are quite insignificant. One feature of the work, however, may be heartily commended, and that is the full index.

The task of writing the early history of India is one not readily essayed because, as Elphinstone admitted, no date in Indian history prior to Alexander's invasion can be precisely determined. Nor has modern research greatly changed this dictum. No one, however, is better equipped for the task than the author of the life of Asoka, and Mr. Vincent A. Smith's third edition of his "Early History of India" (Oxford University Press; 14s. net), first issued nine years ago, and considerably revised, is a welcome contribution. For a true early history of India no record will be complete and final without extensive research and study of the south. The chief reason for a lack of accessible evidence is the fact that the Gangetic plain invariably settled the destiny or satisfied the ambitions of invaders, and no further conquest was attempted, especially in the south. Nothing remains of the work of native historians: "no connected relation," says Elphinstone, "of the national transactions" of southern India. So far the primitive Dravidian stock has been chiefly interpreted through the ethnologist, and Mr. Smith is not alone in his contention that the history of this pre-Aryan race, early driven south, must be regarded as the history of India proper. Isolated studies of the archæological remains, chiefly epigraphic, in which southern India is particularly rich, have appeared from time to time. In ancient times, Ptolemy was familiar with the southern peninsula and called it Damirikē, which Mr. Smith regards as a good transliteration of Tamilakam; and later a long succession of travellers like Marco Polo knew the kingdom of the Tamil at the time of its commercial prosperity. In his present work Mr. Smith confines himself almost exclusively to the political history of early India, which is contained, by extent of conquest, in the north. But we are grateful for his illuminating chapters on the non-Aryan south, and hope that he will soon follow upon his own promising initiative.

Dr. George James Bayles, for six years prize lecturer at Columbia University, and an authority on ecclesiastical law, died on November 20. Dr. Bayles was born at Irvington-on-Hudson, on August 28, 1869. He graduated from Columbia in 1891 with the degree of A.B., and subsequently received the degrees of A.M., LL.B., and Ph.D. Among his works are three volumes dealing with civil church law in New Jersey, New York, and Massachusetts; "Civil Church Law Cases," and "Woman and the Law." Dr. Bayles was a member of the New York Academy of Political Science, the American Academy of Political and Social Science, and the American Historical Association.

NOTES FROM ABROAD.

Surely no previous war ever gave such a stimulus to the lie-making faculty. The newspapers of the world have been printing a spurious article, first published in a Swedish paper, in which Tolstoy was alleged to have predicted the present war and to have foretold the coming of a new Napoleon from the North. The prophecy appeared in the form of a letter of Tolstoy's to his daughter. His literary representative and executor, Vladimir Tchertkoff, writes from Russia to a London paper to expose the fraud. Tolstoy never wrote anything of the kind.

The General Medical Council of the United Kingdom is becoming anxious lest there should be a serious lack of doctors in the near future. Enlistment for the war has brought down the number of medical students at Cambridge to 64, as against 116 in the corresponding term last year, and similar decreases are reported from the other medical schools. The new conditions created by the Insurance Act had already made it difficult for the profession to meet all the demands upon it, and this pressure is daily increasing as the Red Cross hospitals are becoming filled with wounded soldiers from the front. It is now being suggested that medical students will really be doing a more patriotic service by completing their course than by leaving to join the colors.

One of the minor ironies of the war is the predicament of the British Universities' Mission to Central Africa. Its operations are largely carried on in German East Africa. The officials of the society at home recently sent out to the missionaries a consignment of food, drugs, and other necessaries in a German vessel. It is feared that this vessel, with her cargo, will be taken as a prize of war by a British cruiser.

Joseph Déchelette, killed at the battle of the Aisne by a German shell exploding against his breast, was one of the French archæologists whose work has been most useful to history. The three bulky volumes which have been published of his "Manuel d'Archéologie préhistorique, celtique et gallo-romaine" form the only approach to a complete repertory of researches and results in this matter. He carried on his life work in the admirable provincial museum of Roanne, on the upper Loire. This he had organized, and he remained its curator, although Paris had welcomed him to the Institut de France and the University. His age, but not his patriotism, would have exempted him from active service; and he has died a captain of the territorial army at the head of his company.

Henry Beuchat followed closely in the steps of Déchelette when writing his unique manual of American archæology which appeared in the same series (see review in *Nation* of October 9, 1913). He, too, is said to have perished, in the Stefansson Arctic expedition, which he hoped would give him opportunities to study the industries of the Eskimos and further connect their race with prehistoric science. The American press, while chronicling his death in the disaster, seems not to have known the unparalleled service he had rendered to our own prehistory. Our veteran Americanist, Henry Vignaud, when presenting his book to the public, said: "Its publication is in advance of any work of like character in Germany or England or America."

A neutral and, by all ordinary rules, an impartial and well-informed judgment of what has really been going on in Belgium is found in the declaration made by Prof. Alfred Martin in the name of the Consistory of Geneva, Switzerland, after due report by the Rev. Pastor Gailiard: "We consider that, even in the interests of the Protestant churches of Belgium, it is better to delay sending our proposed letter of sympathy to them until such time as Right shall no longer be trampled under foot. Our letter would not reach those for whom we should destine it, and, very likely, would be intercepted by the German military authority which might find in it a pretext for new severities. But it needs not to be said that each of us feels, not only for the churches of Belgium, but also for so brave a country, ardent sympathy. The unprecedented misfortunes of which it is the innocent victim are for us a veritable nightmare. The violation of its neutrality in contempt of treaties, the invasion of its territory by a foreign army which has devastated it, the destruction of its cities and villages, the ruin of its commerce and industry, the crushing taxes levied on its inhabitants, the carrying away of hostages—no calamity has been spared this unhappy people who were a menace to none and whose only crime consisted in their will to remain free. Amid all these misfortunes, we do not count the invectives which the conquerors have generously flung at them, for such iniquity only hurts its authors. A manifesto drawn up by a group of men of science, among whom are found professors of law and theology, treats as bandits citizens who have taken up arms to defend their homes. Bandits, so be it! In the Belgian bandits we hail the valiant race of those whom the Duke of Alva called disdainfully *Gueux* (beggars). History, a just judge, takes upon herself to transform a low insult into a title of glory."

Science

VITALISM AND MECHANISM.

Mechanism, Life, and Personality: An Examination of the Mechanistic Theory of Life and Mind. By J. S. Haldane. New York: E. P. Dutton & Co. $1 net.

Every generation of thinking men, from the time of Aristotle, has attacked the problems of life and mind in an endeavor to correlate its science or its philosophy with the prevalent thought of the age; but great as the progress has been all along the line, in philosophy as well as in science, most biologists at the present day would probably admit that we are still confronted by the same impenetrable wall that baffled the ancients, and that in this particular field we do not seem to have advanced beyond the classification of the venerable father of zoölogy, who divided all things into the Living and the Dead.

Dr. Haldane, who speaks with the authority of a physiologist of high repute, and of one who has mastered his material in more than one field, is of a different opinion. Moreover, he considers the time to be "more than ripe for bringing the great biological movement of the nineteenth century into definite relation with the main stream of human thought." The four brief lectures which form the present volume—"The Mechanistic Theory of Life," "Criticism of the Mechanistic Theory," "Biology and the Physical Sciences," and "Personality"—are to be regarded as a contribution to this end. For all who can follow his philosophy many devious ways will be perceptibly straightened.

From the standpoint of a scientific worker the first two lectures are the more interesting, on account of their clear statement and keen criticism of the mechanistic theory of life. The general reader, on the other hand, will doubtless find his attention more easily engaged in the final essays, in which the author calls to his aid the supporting arm of philosophy. The lectures are marked throughout by an admirable conciseness, and the restraint of the author who can compress to so brief a compass a discussion of many fundamental problems is as noteworthy as the originality of his ideas.

The author's argument does not admit of much further condensation, but we shall attempt to summarize it, and then glance at what is offered in place of the theories assailed. The mechanistic theory of life, as now generally understood, is that form of materialism which attempts to explain or describe living things as nothing but machines, and to account for every vital phenomenon, including human experience, as a result of chemical and physical change. It is not denied that this product of Cartesian philosophy has borne some excellent fruit, but it is considered to have outgrown its usefulness, and to be ripe for the rubbish-heap. It has become, says the author, more of a hindrance than a help in solving the problems of modern biology.

The traditional opponents of the mechanistic theory, the vitalists, and the animists, for the purposes of the present argument, are placed in the same category, since both maintain that living things are so peculiar that some guiding and controlling factor, unknown to physics or chemistry, must be present. The vitalists have called this factor the vital force or principle, or latterly the entelechy, while to the animist it is the soul, that may even act sub-consciously.

The defects of vitalism are found to be many and weighty; if we assume this doctrine to be true, the action of the "vital principle" is strictly limited by the physical and chemical environment. Lower or raise the temperature, or cut off the supply of oxygen, and the vital principle vanishes. Wherever we turn we find each part of every organism closely dependent, in both a qualitative and a quantitative sense, upon such influences. A mechanist might therefore ask if such a theory had any excuse for existence. Vitalism would further seem to imply a breach in the law of the conservation of energy, which all experimental evidence has firmly established in the domain of biology. Again, as the author observes, in order to guide all the complex movements and processes of living things, the vital principle would stand in need of superhuman knowledge, yet it is supposed to act blindly and unconsciously. Such an agent is clearly unintelligible, and the hypothesis is practically useless.

With vitalism and animism disposed of, the author devotes himself freely to the mechanistic theory, and concludes, as we have intimated, that it totally fails to explain either the lower or the higher forms of life and mind. Among what are held to be fatal objections to this theory may be mentioned the delicacy of organic regulation and the phenomena of reproduction and heredity. Within the organism of whatever grade, perfect adjustment and correlation are the rule. It is thus the function of certain cells of the vertebrate kidney to hold the composition of the blood constant, yet what under the microscope appears like gelatinous matter "can react, and continue through life to react, true to the finest mechanism of tempered steel, to the minutest change in the environment." We may as well relegate to oblivion those crude notions that found their favorite expression in "jelly-like protoplasm," or an indefinite "plasma," for "simple protoplasm" does not exist, even among the most primitive bacteria. "What the mechanistic theory must assume in the case of an organism such as man is a vast assemblage of the most intricate and delicately adjusted cell-mechanisms, each mechanism being so constituted as to keep itself in working order year after year, and in exact coördination with the working of the millions of other cell-mechanisms which make up the whole organism."

If such assumptions tax the imagination, how shall we deal with reproduction and heredity on the basis of pure mechanics? A vast organization of cell mechanisms which represents the body of any higher animal has arisen from a single cell, that was produced by the union of two cells, an egg and sperm. The hereditary characters coming from both of these cells must be carried in the two nuclei which unite to form the nucleus of the germ or embryo. "On the mechanistic theory, this nucleus must carry within its substance a mechanism which by reaction with the environment not only produces the millions of complex and delicately balanced mechanisms which constitute the adult organism, but provides for their orderly arrangement into tissues and organs, and for their orderly development in a certain perfectly specific manner."

"The mind," declares the author, "recoils from such a stupendous conception." To continue, we are compelled, on the mechanistic hypothesis, "to attribute to the germ plasm, or nuclear substance, a structure so arranged that in the presence of suitable pabulum and stimuli it produces the whole of the vast and definitely ordered assemblage of mechanisms existing in the adult organism. Such a structure must be absolutely definite and inconceivably complex. There is no escape from this assumption." In other words, how two nuclear mechanisms can fuse in fertilization, to form a mechanism of a different order, is unintelligible. When the analysis is pushed to this extreme no one can fail to perceive that the difficulties which the mechanist must encounter in dealing with the powers and properties of the living things are not only very real but apparently insuperable.

If the mechanist, the vitalist, and the animist are all at fault, how, then, are we to account for life and mind? In the last two chapters of this volume the author gives his answer, which might be called the creed of a physiologist, although it is supported, he is assured, by both logic and philosophy. We shall try to epitomize the author's conclusions, but the interested reader must follow the argument for himself: The only real world is that of ideas, which the human mind and personality has moulded for itself, and there is no other. Did any other world exist, it would be impossible for us to know it. Of things, three classes are to be clearly differentiated, though all are bound inextricably together—persons, organisms, and dead or inorganic things. The first cleavage-line is furnished by the mere organism, struggling blindly with an environment which it does not clearly perceive or comprehend; nevertheless, it represents a living, active, structural, and autonomous whole, and furnishes us with a concept that is radically different from anything known to either physics or chemistry, for it embraces the idea of organic determination, and this determination is the key to all organic phenomena. We cannot even admit, says the author, that the living substance is material. The person, alone conscious of itself and of its environment, which it moulds to its will, is more than a machine, more than a mere organism; it is a spiritual being *par excellence*, for it is endowed with personality, the central fact and problem of the uni-

verse. There is no separateness of existence, for, as the author reiterates, all things form one inseparable whole. "Both the external world of things and the spiritual world of persons have their existence, somehow or other, in only one Supreme Existence."

The living organism is not only a unique and specific entity, but it also belongs to a wider organic whole, without which much of its life and its death would be unintelligible. Upon this basis we must, of course, abandon all attempts at a causal explanation of life, but this is thought to be a distinct gain, for if we regard the living organism as a machine merely, we at once abstract from it all that is really characteristic of life. Psychology deals with the person, with the whole man; physiology with only an abstract, since in the latter science the attributes of personality are invariably left out. "Physiological psychology," as a science, cannot therefore exist, and the phrase, with all that is implied, must be regarded as a misborn product of modern times, inevitably doomed to perish.

Personal existence implies participation in a wider personal life, and in speaking of duty the author affirms that "in losing his individual personality in the wider personal life he realizes his true personality," which does not perish with the life of the individual. Philosophy, says the author, leads us up to a central personality, that is not merely an individual. "However dimly we may see it, it is a personality which includes within itself our whole universe."

If we ask what of the time before conscious personality existed, the answer is: "We know nothing of such a time; and time and matter are but expressions of personality. The logic of the universe is the logic of personality, and cannot, as it were, rise up and destroy itself. It is the business of philosophy and religion—for there is no real distinction between the two—to free us from the various illusions through which such a theory seems possible." To quote further: "Personality is living, suffering, rejoicing, and working existence. This idea is clearly embodied in the Christian conception of God; and when we try to penetrate the sensuous mist which blurs that conception we can see that our discussion has brought us very near to it."

To conclude, Dr. Haldane believes that life supplies us with a fundamental concept, that, evolution or no evolution, living things have not come from dead matter, that the world and everything within it has a spiritual significance. The biological concept, he thinks, may in time be extended so as to comprehend the entire realm of inorganic nature. Granting his assumptions, speculation in regard to the origin of either life or personality would therefore be useless.

Dr. Charles Sedgwick Minot, professor of anatomy and director of the anatomical laboratories of the Harvard Medical School, died on November 19. Dr. Minot was born in West Roxbury, Mass., on December 23, 1852. He graduated from the Massachusetts Institute of Technology in 1872, and from 1873-6 studied in Leipzig, Paris, and Würzburg. In 1875 he received the degree of S.D. from Harvard. He also received an honorary LL.D. from Yale, Toronto, and St. Andrew's University, Scotland, and Oxford conferred on him a doctorate of science in 1902. The greater part of Dr. Minot's career was passed at the Harvard Medical School, and since 1905 he had been the James Stillman professor of comparative anatomy. Dr. Minot invented two forms of automatic microtomes, the "automatic wheel microtome" and the "precision microtome," and he was widely known for his studies in the origin of life. He was a fellow or member of numerous American and foreign scientific associations, and was president of the American Association for the Advancement of Science in 1900. His publications included: "Human Embryology," 1892; "Bibliography of Vertebrate Embryology," 1893; "A Laboratory Textbook of Embryology," 1903; "Age, Growth, and Death," 1908: "Die Methode der Wissenschaft," 1913, and numerous papers on biological subjects.

Drama and Music

THE MODERN STAGE.

The Theatre of To-day. By Hiram Kelly Moderwell. New York: John Lane Co. $1.50 net.

All persons interested in the modern stage and drama will find this an attractive and instructive book. The author is thoroughly well acquainted with every phase of his subject, writes in a compact and vivacious style, and exhibits an uncommon breadth of view in combination with much sound judgment. Actually, he furnishes a rapid but comprehensive survey of the theatre, at home and abroad, its recent developments in literary, artistic, mechanical, architectural, and managerial achievement, on commercial and independent stages, and therefrom deduces speculations and hopes for the future. With some of his critical estimates of the genius and influence of certain writers of the realistic and emotional school one may disagree—he is somewhat apt to mistake the strange or abnormal for the miraculous—but, as a rule, he is both acute and sane, and his dependence upon facts encourages faith in his generally optimistic outlook. His volume must find a place in every complete theatrical library.

Of course, he is traversing well-beaten ground, and has little to tell that will be absolutely new to the student of theatrical affairs. The value of his work lies in the convenience and brevity of its summaries, its grasp of essentials, and its avoidance of insignificant detail, but, above all, in its realization of the possibilities and almost unlimited scope of the ideal theatre. He sees clearly not only the degradation inflicted upon the stage by the present systems of commercial management, but the underlying causes which have made it inevitable. Without committing himself definitely to the support of any particular plan, he insists strongly upon the necessity for some sort of democratic control, maintaining that the public, as a whole, will not feel a personal interest in an institution in which it has no sense of ownership. In support of this theory he describes the origin, growth, and notable accomplishment of the Free Folk Theatre in Berlin and similar organizations. There can be no question of the superior artistic value of any self-sustained repertory theatre to any other. For one thing, these theatres are the only effective schools of acting. But whether the whole problem of a dramatic renaissance can be solved by the establishment of popular proprietorship on a remunerative basis is another matter. Such a scheme does not, for instance, insure the maintenance of an enlightened and catholic directorship. It is only reasonable to suppose that the choice of productions would, sooner or later, be dictated by the will of the majority, which probably would declare itself in favor of the lighter and least worthy forms of entertainment. Certainly it would not be likely to lead to that free and open competition which existed under the old system of the stock company and is the best stimulant for art of all varieties.

The fact is that commercialism in the theatre is not, of itself, necessarily an evil. To a certain extent it is inevitable and beneficent. Theatres of every kind, unless highly endowed and therefore non-competitive—which is for many reasons undesirable—must depend upon their receipts. It is only abominable and destructive when organized, as it is to-day, into a few Trusts for the abolition of rivalry and for mere money-making without reference to art or public responsibility of any kind. What is needed is a series of competitive, self-centred theatres seeking public support on their individual merits. These, of course, would be run on different lines, in order to attract different constituencies, but would find their profit in the excellence of their reputations. It is in the establishment of independent theatres, under individual management of whatever kind, that the surest hope of a dramatic revival is based, and the number of them is steadily and rapidly increasing in this country and in Europe.

Mr. Moderwell gives an inspiriting account of these houses, their origin and intent, and their achievement, not only in the newer literary, realistic, or imaginative drama, but in the application of the latest mechanical and scientific devices for artistic scenic illusion and suggestion. Comparatively few persons, outside the profession, know what immense advances have been made, during the last few years, towards a revolution in the very form of theatres and their stage machinery and appliances. Those desiring information on the subject will do well to look for it in these pages. There is no reason, of course, why the stage, to which all the arts are tributary, should not profit by any form of artistry useful to it; but there is, neverthe-

less, a real danger to the art of acting in the latest theories of decorative enthusiasts. After all, the interpretation of dramatic fiction by human players is the primary and all important function of the stage. Better no scenery at all than a scenery which by its splendor or mystification distracts attention from the words and action. If Miss Horniman ever said, as reported, that the scenic ideas of Mr. Gordon Craig, who would replace live actors by puppets, were sheer nonsense, she was not far wrong. This puppet-making is what most of the actor-managers from Charles Kean to Beerbohm Tree have, in effect, been engaged in. The best scenery is that which is the best background for the play. What is more than this cometh of evil. But there is a legitimate field for highly symbolical, imaginative, and interpretative scenery in opera, poetic romance, and Maeterlinckian fantasy. In the theatre spectacle is the first and last device for the concealment of histrionic incompetence.

The chapters dealing with modern dramatists are models of concise and intelligent comment. Mr. Moderwell, just and discriminating as he is upon the whole in his comments upon tradition, is somewhat anarchic in his championship of the ultra-moderns. He has even invented a phrase to justify his eulogistic admiration of Strindberg, whose extravagances he approves on the score of "intensive psychology." It is an easy way of accounting for any conceivable inconsistency in the portrayal of character. But it may be conceded that Strindberg had genius of a wayward order, and that human nature is confoundedly complex. Unfortunately, insoluble psychological problems are tiresome or exasperating except in a hospital. In most instances, Mr. Moderwell notes the characteristics of his representative dramatists—he leaves the crowd of popular "hacks," without so much as a contemptuous mention, severely alone—with uncommon discernment and felicity. Even when he exaggerates their sum—as in the case of Ibsen, Shaw, and one or two others—his appreciation of their several abilities is judicious and keen. Evidently he is an omnivorous reader, with a most retentive and calculating memory. He has pungent paragraphs on all the prominent dramatists of the last quarter-century in Russia, Austria, Germany, France, Italy, Scandinavia, England, and the United States, and speaks of all with the authority that comes of intimate knowledge. Thus, among the French, he dissects the work of Rostand, Bernstein, Bataille, Donnay, Hervieu, Porto Riche, Brieux, and Curel; of the Italians he selects D'Annunzio, Benelli, Giacosa, and Bracco; of the Russians, Alexander and Leo Tolstoy, Tchekoff, Gorky, and Andreieff; of the Germanic branch, Schnitzler, Bahr, Hofmannsthal, Hardt, Eulenberg, Molnar, and Wedekind; of the English, Barrie, Arnold Bennett, and Masefield; of the Americans, Walter, Sheldon, Charles Klein, Rann Kennedy, and Percy MacKaye. The list is not complete, but is sufficient to indicate the range of his scholarship.

THE REVIVAL OF "CARMEN."

Emma Calvé made the part of Carmen, in Bizet's opera, so much her own that other singers, however venturesome, have hesitated to try to replace her. This is one of several reasons why this masterwork, which in the opinion of many good judges ranks next to Wagner's operas in the matter of harmonic as well as melodic inspiration—Nietzsche even placed it above Wagner's—was neglected for nearly six years at the Metropolitan Opera House. The Century Company won one of its biggest successes with it within a year, but "Carmen," simple and tuneful though it may seem as compared with some other works, is an opera which requires for the full setting forth of its wonderfully varied charms a cast of the greatest singers available. New Yorkers heard it three decades ago with Minnie Hauk and Italo Campanini; some years later, with Calvé and Jean de Reszke; and last week the two most popular artists at the Metropolitan—Geraldine Farrar and Enrico Caruso—combined their rare art and once more aroused an eager audience to the highest pitch of enthusiasm.

Caruso has usually chosen the part of Don José as one of three or four in which he annually appears in Berlin, and not without reason, for, better perhaps than any other rôle in his repertory, it shows his skill as an actor as well as the unequalled charm of his voice. New York audiences also have had repeated opportunity to admire his Don José. His enactment of the last scene, where he chases Carmen and plunges his dagger into her, is one of the finest bits of tragic acting ever seen on the operatic stage. Quite as impressive as this was his enactment, last week, of the officer's insane jealousy in the third act. He is less successful in the lighter episodes of the first act, but his voice is as glorious as ever.

Geraldine Farrar has among her best rôles two—Zerlina in Mozart's "Don Giovanni" and the page Cherubino in his "Figaro"—which betray her rare gift for vivacious and comic action; but the parts which in this country have done most to make her famous are pathetic and tragic—the Goosegirl in "Königskinder," "Madama Butterfly," "Tosca," and "Marguerite." Carmen is a composite. In the overture the composer sounds the tragic Fate theme which accompanies her throughout the opera; but in the first two acts the fascinating gypsy girl is seen chiefly in her coquettish, merry, mischievous moods. In her portrayal of these Emma Calvé was inimitable, and it was probably the fear of falling below her standard that made Miss Farrar nervous and inclined to over-act, particularly in the episode with the soldiers in front of the cigarette factory. Again, in the scene where she reads her death in the cards, Miss Farrar, though convincing, did not rise to the height of Calvé, whose big, horror-struck eyes will never be forgotten by those who saw them. In other respects—especially in her tigerish rage when Don José brutally ill-treats her, and in the portrayal by gesture and facial expression of her boredom and impatience at Don José's insistence in front of the bull ring—she is already perfect. Vocally her performance was superb. The part suits her voice admirably, and having evidently recovered her health, she was in better voice than at any time last season.

Toscanini's conducting, though vivacious, lacked some of the delicacy, glow, and esprit of Campanini's at the Manhattan Opera House in the days of Oscar Hammerstein, but this was largely owing, no doubt, to insufficient rehearsing due to the delayed arrival of the singers from Europe. It cannot be said that the new scenic setting provided by the management is an improvement on the discarded one; rather the contrary; but the spectacle in front of the bull ring is past all precedent in pomp and splendor, giving one an excellent idea of Spanish originals, with the gayly attired men, mules, and horses, the shouting, the flower girls waiting for the toreador, who comes at the end of the procession with his new sweetheart, Carmen, at his side, and all of it glorified by Bizet's inspiring music. The ballet in this last act also is superlatively interesting as danced by the new ballerina, Rosina Galli, and her companions, to exquisite music, some of which is taken from Bizet's "L'Arlésienne" and "La Jolie Fille de Perthe."

HENRY T. FINCK.

Finance

RAILWAY REGULATION AND PHYSICAL VALUATION.

Charles M. Prouty, formerly Interstate Commerce Commissioner and now in charge of what is known as the "physical valuation" of the railways in the United States, speaking before the Convention of Railway Commissioners a few days ago, said that the question of whether the railways should be publicly or privately owned and operated could never be satisfactorily settled until it was known what relation actual value bore to present outstanding securities. He further said:

Assuming that we are to leave the discharge of this function to private enterprise, there arises the even more difficult question as to what the treatment of this private capital shall be. What rates shall be accorded in order that the present investment may be fairly dealt with, and that such further investment will be induced as will render possible the proper development of these facilities?

It must be remembered that the "valuation" process which the Government has in hand will not actually assume to determine what is the actual "present value" of the railways; it will simply collect the facts which are necessary to enable such determination to be made by judicial bodies, for it belongs to such bodies to determine this question. No law of Congress can lay down the principles upon which it is to be determined. The main factors which govern were partly enumerated by the Supreme Court in Smyth vs. Ames (1898) as follows:

And in order to ascertain that value the original cost of construction, the amount expended in permanent improvements, the amount and market value of its bonds and stock, the present as compared with the original cost of construction, the probable earning capacity of the property under particular rates prescribed by the statute, and the sums required to meet operating expenses

are all matters for consideration and are to be given such weight as may be just and right in each case. We do not say that there may not be other matters to be regarded in estimating the value of the property.

It is the object of the Valuation Commission, of which Mr. Prouty is head, to collect information on these points. Apparently, the task will take seven to ten years to complete, and the total cost will be something like $50,000,000, of which 70 per cent. will be met by the railways.

Let us suppose, for the sake of argument, that "valuation" has been made, and that the courts have named a sum of money as representing the fair "present value" of each railway. The problem will then be to make rates such as will give a "fair return" on this "value," and also will attract new capital. Obviously, rates will have to be, as at present, uniform for all carriers throughout each particular rate territory; further, it is impossible to suppose that the existing territorial structures will be abandoned, for such a step would produce instant disturbance of existing commercial and industrial equilibrium. It is also clear that, whatever the courts may decide to be the "present value" of capital already invested, it is the investor who will decide what rate constitutes a "fair return" thereon, and also it is the investor who will judge as to the attractiveness or otherwise of the terms offered by the railways for employment of new capital. Neither Congress nor courts can determine what such return must be—they can only recognize and give effect to whatever the investor determines on the point. Neither Congress nor courts can force investors to provide new capital for the railways. Such capital must be attracted; it cannot be commandeered.

Apparently, it is intended to use the "present values" as ascertained under the law very much as the railways in the 5 per cent. advance case used the "property investment," and set such "values," grouped according to territorial considerations and the "earnings" thereon, against rate structures as a whole, testing results finally in the light of the investor's own judgment. He must, in any event—if private ownership and operation are to continue—be the court of last resort from whom there is no appeal.

This being so, what is the peculiar importance for regulation of the "physical valuation" now proceeding? The investor has been "valuing" these properties every day since they came into being. If the "value" found by the courts agrees with his judgment, well and good; if it does not, he will not accept the court's "value" as a basis for his future investments. The Government (through Congress and the courts) can make him *sell* his property at a valuation, but it cannot oblige him to accept it for the purpose of future business relations with the Government. It would in fact seem that the real importance of Government valuation would be much more as a necessary step before Government purchase than as a preliminary to scientific regulation.

It is a curious thing that so fundamental a fact as the investor's absolute control over his own capital should not be recognized as the most important consideration in regulation of privately owned enterprises—especially when, as in the case of railways in the United States, a continual supply of new capital is absolutely necessary. If there were no need for this new capital it would be easy enough to say that the railways were worth so much and that they should pay so much to their owners and no more. But as things are, the benefits of private ownership and private enterprise can only be obtained by satisfaction of the investor's demands. This is a practical consideration which no amount of theorizing can remove.

AGRICULTURAL EDUCATION FOR TEACHERS

By G. A. BRICKER, Assistant Professor of Agricultural Education, Ohio State University

80 cents

The result of long experience, observation and study in this special field. It indicates briefly but clearly the proper course to pursue in teaching agriculture, and will be equally helpful to the normal student, the active teacher, the superintendent, or the professor of agricultural education.

AMERICAN BOOK COMPANY
NEW YORK CINCINNATI CHICAGO

Daudet's Tartarin de Tarascon

Edited by BARRY CERF, *Associate Professor of Romance Languages, University of Wisconsin.*

This text offers American readers for the first time a vocabulary edition of Daudet's masterpiece, reproduced without excisions or alterations. Young people will not fail to enjoy the drollery and irrepressible imagination of this typical product of Provence. The introduction supplies a full discussion of Daudet's life and works and the notes furnish the necessary background for the story. ***45 cents***

Arnold's Fritz auf Ferien

Edited by CLARENCE WILLIS EASTMAN, *Professor of German Language and Literature in Amherst College.*

This story, from the pen of one of the popular writers of children's stories in Germany, has long been a favorite in the schools of this country and is one of the texts recommended for the elementary course by the Committee of Twelve of the Modern Language Association. The notes and vocabulary are complete, and the pronunciation of foreign words and the accentuation of German words have been indicated where necessary. Exercises for composition and questions as a basis for oral work have been provided. ***30 cents***

WILD LIFE CONSERVATION IN THEORY AND PRACTICE

By WILLIAM T. HORNADAY, Sc.D.
Director of the New York Zoological Park.

This book contains the story back of Dr. Hornaday's other books, such as "Camp-Fires in the Canadian Rockies." Like all his work, literary or executive, it illustrates his profound knowledge of animals and his warm love for them—an affection which, without wasting itself in sentimentality, has spurred him to an active campaign for the preservation of birds and beasts. An interesting feature of the book is a chapter on private game preserves, by Frederic C. Walcott, owner of a successful reserve in Norfolk, Conn.

Price $1.50 net, postpaid.

VOL. XCIX.—NO. 2579 THURSDAY, DECEMBER 3, 1914 Reg. U. S. Pat. Office. PRICE TEN CENTS

Free Library 2ST 31DEC14

SCRIBNER HOLIDAY BOOKS

F. Hopkinson Smith has proved his rare versatility in **IN DICKENS' LONDON,** in which he not only described the haunts of the great author and of his characters in words, but illustrated them as well in the perfect medium of charcoal.

With 24 full-page illustrations **$3.50 net;** postage extra.

George W. Cable in **THE AMATEUR GARDEN** tells how gardens can be planned, grown and cared for by the owner, without the assistance of a corps of gardeners. The book is largely the result of the author's personal experience at Northampton and in the South.

Illustrated. **$1.50 net;** postage extra.

John Galsworthy in **MEMORIES** has written a charmingly sympathetic biographical sketch of a dog—a spaniel that came into the author's possession almost at birth and remained with him through life. The author's insight and his power of interpretation individualize the little spaniel and bring him into the reader's immediate sympathy.

Illustrated in color by Maud Earl. **$1.50 net;** postage extra.

Noah Brooks in **THE BOY EMIGRANTS** created a classic which has lived through two generations. For this beautiful edition H. J. Dunn has painted a series of glowing pictures of the rush to the California gold-fields in forty-nine. This book will be a leading holiday book of the season.

Illustrated with 10 full-page illustrations and lining paper in full color. **$2.00 net;** postage extra.

E. Alexander Powell in **THE END OF THE TRAIL** writes of the Great West from New Mexico to British Columbia and reveals the existence of the pioneer in "the unexplored and unexploited portions of the Last West." He tells how to "See America First" in a new way.

Profusely illustrated from remarkable photographs. **$3.00 net;** postage extra.

Theodore Roosevelt in **THROUGH THE BRAZILIAN WILDERNESS** gives the complete account of his adventures in South America, including his exploration of the famous River of Doubt, his hunting experiences, his scientific investigations, etc.

Illustrated with photographs by Kermit Roosevelt and others. **$3.50 net;** postage extra.

Mrs. R. L. Stevenson in her DIARY describes **THE CRUISE OF THE JANET NICHOL** Among the South Sea Islands in 1890. The diary gives most fascinating glimpses of her husband and should be an inspiration to all lovers of Stevenson.

Profusely illustrated. **$1.75 net;** postage extra.

W. T. Hornaday in the **FIRESIDE EDITION** of **THE AMERICAN NATURAL HISTORY** has produced as authoritative and at the same time as readable a discussion of the whole subject of American higher animals as can be found.

Illustrated. 4 vols. The set in a box. **$7.50 net.**

THE BAKER & TAYLOR CO.
33-37 E. 17th St., New York City

HARVARD UNIVERSITY PRESS

The Governments of France, Italy, and Germany

By A. LAWRENCE LOWELL, LL.D., Ph.D., President of Harvard University.

8vo. Cloth. 230 pages. $1.25 net.

A notable survey, concise and authoritative, of governmental machinery in the chief states of the Continent, abridged and revised from the author's well-known "Governments and Parties in Continental Europe."

Municipal Charters

By NATHAN MATTHEWS, LL.D., Mayor of Boston, 1891-95. Chairman of the Boston Finance Commission, 1907-09, and Lecturer on Municipal Government in Harvard University.

8vo. Law buckram. 203 pages. $2.00 net.

After thirty years' experience in municipal politics, the author has written a hopeful, practical handbook of city charter-making. He treats the city strictly as a business corporation, pointing out by means of specimen charters of the Commission and ordinary types, how political corruption may often be obviated when adequate methods of administration are prescribed by law.

Bibliography of Municipal Government

By WILLIAM BENNETT MUNRO, Ph.D., LL.D., Professor of Municipal Government in Harvard University.

(To be ready in December.)

Scientific Management

Edited by C. BERTRAND THOMPSON, LL.B., A.M., Lecturer on Manufacturing in Harvard University.

8vo. Cloth. 878 pages, with diagrams. $4.00 net.

The first comprehensive presentation of the Taylor System of factory management, practically helpful in its attention to details, and indicating the conclusions of presidents, managers, employees, and outside students. Objections as well as the theories of successful managers are represented in this impartial survey.

The Oberlehrer: A Study of the Social and Professional Evolution of the German Schoolmaster

By WILLIAM LETCHEL LEARNED, Ph.D., of the Carnegie Foundation for the Advancement of Teaching.

8vo. Cloth. 150 pages. $1.25 net.

The position of honor and influence which the German teacher in secondary schools has won for himself in the last half century is without parallel in any other country.

The Mary Carleton Narratives, 1663-73: A Missing Chapter in the History of the English Novel

By ERNEST BERNBAUM, PhD., Instructor in English in Harvard University.

8vo. Cloth. 106 pages. $1.00 net.

What has for 250 years been supposed to be a biography is now shown to be a novel, sustained by ingenious devices that anticipate the methods of Defoe. This discovery explodes the generally accepted doctrine that in the Restoration period the art of serious realistic fiction was unpracticed.

Metempsychosis: The Ingersoll Lecture for 1914

GEORGE FOOT MOORE, A.M., LL.D., Frothingham Professor of the History of Religions in Harvard University.

16mo. Cloth. 86 pages. 75 cents net.

The doctrine of transmigration of souls is shown to be not without its practical bearing on the "probation-religions" of to-day.

Eugippius: The Life of Saint Severinus

Translated by GEORGE W. ROBINSON, A.B., Secretary of the Graduate School of Arts and Sciences in Harvard University.

8vo. Cloth. 141 pages. $1.50 net.

The first English translation of one of the most important documents on the history and life of the fifth century. Printed on Library Record paper; with map.

HARVARD UNIVERSITY PRESS, Cambridge, Mass.

For Little Children

A BOOK OF FAIRY-TALE FOXES

By CLIFTON JOHNSON. Stories about foxes always have had an unusual charm for children, and this collection of tales will prove no exception. *Illustrated.* 75c *net.*

THE DOT BOOK

By CLIFFORD L. SHERMAN. A clever picture-book with jingles of which the final word is left blank. The object denoted by the word is indicated by dots and numbers which, when connected, make a picture of the missing object. *Illustrated.* $1.00 *net.*

THE ESKIMO TWINS

By LUCY FITCH PERKINS. As bright and jolly as the Dutch, the Japanese and the Irish twins, whose stories have delighted so many young readers. *Illustrated.* $1.00 *net.*

THE EARLY LIFE OF MR. MAN

By E. BOYD SMITH. This new story by the author of "The Story of Noah's Ark" deals with life "before the flood." With 24 full-page colored pictures so bubbling over with humor that both young and old will delight in them. $2.00 *net.*

NANNETTE AND THE BABY MONKEY

By JOSEPHINE SCRIBNER GATES. Like "Litt'e Girl Blue," Nannette is a doll—a live one—and her adventures are of the most unexpected and interesting order. *Illustrated.* 50c *net.*

GOOD STORIES FOR GREAT HOLIDAYS

By FRANCES JENKINS OLCOTT. 120 stories to be told or read to children—or read by children—in celebration of seventeen of our most important holidays. It will prove interesting to boys and girls of all ages. *Illus.* $2.00 *net.*

THE DOERS

By WILLIAM J. HOPKINS. Tells in a way that will interest young children of the various kinds of work that go into the building of a house. *Illustrated.* $1.00 *net.*

SONGS OF SIXPENCE

By ABBIE FARWELL BROWN. Miss Brown's "Pocketful of Posies" and "Fresh Posies" are books dear to many young hearts and this new collection will have an equally strong appeal. *Illustrated,* $1.25 *net.*

BLACK TALES FOR WHITE CHILDREN

By CAPTAIN and MRS. STIGAND. Unusually attractive stories for children collected and told by the Governor of an East African province and his wife. *Illustrated.* $1.50 *net.*

The home library is to the fireside what the sacred books are to a temple of worship—a repository of inspiration. In harmony with the sacred ideals of Christmas, therefore, and with the fact that the Scriptures have mightily and gloriously affected the language and literature of Christendom, let your gifts on the approaching Christmas be of books, says

ABRAHAM MITRIE RIHBANY,

Pastor of the Church of the Disciples, Boston, and author of

A FAR JOURNEY

"Mr. Rihbany's book will stand with those of Jacob Riis and Mary Antin, an eloquent tribute to the efficacy of the American melting pot."—*Chicago Tribune. Illustrated.* $1.75 *net.*

THE GRAND TOUR IN THE 18TH CENTURY

By WILLIAM E. MEAD. A quaint, amusing and instructive account of the modes and conditions of travel in eighteenth century Europe. *Illustrated.* $4.00 *net.*

SAMUEL F. B. MORSE

By EDWARD L. MORSE. The first authoritative biography, based on his letters and journals, of a man who was not only a great inventor, but a notable painter as well, and the intimate of many famous persons. 2 vols. *Fully illustrated.* $7.50 *net.*

THE LIFE OF RUTHERFORD B. HAYES

By CHARLES RICHARD WILLIAMS. A full and intimate biography of the nineteenth president of the United States. 2 vols. *Illustrated.* $7.50 *net.*

THE LIFE OF THOMAS B. REED

By SAMUEL W. McCALL. A notable addition to the lives of eminent Americans, as readable as it is instructive. *Illustrated.* $3.00 *net.*

MEDITATIONS ON VOTES FOR WOMEN

By SAMUEL M. CROTHERS. A quiet consideration of the subject, showing that the granting of the suffrage to women at the present time is a conservative measure. $1.00 *net.*

PAN-GERMANISM

By ROLAND G. USHER. This remarkable book is a forecast of the present war and an explanation of the forces that made it inevitable. It is intended for popular reading and is absolutely impartial. $1.75 *net.*

WAR'S AFTERMATH

By DAVID STARR JORDAN and HARVEY ERNEST JORDAN. A short, authoritative study of the effect of war on the quality of manhood for generations after, of special timeliness. 75c. *net.*

ROUND THE WORLD IN ANY NUMBER OF DAYS

By MAURICE BARING. Characteristically humorous sketches of the United States and other countries by the author of "Lost Diaries," etc. *Illustrated.* $1.25 *net.*

THE LURE of the CAMERA

By CHARLES S. OLCOTT. "Mr. Olcott's knowledge of the great authors is ample, his love of nature abounding and his choice of pictorial illustrations judicious."—*Photo Era.* 48 *illustrations.* $3.00 *net.*

SONGS OF THE OUTLANDS

By HENRY HERBERT KNIBBS. Tells in vivid and swinging verse stories of the West. $1.25 *net.*

WHAT MEN LIVE BY

By DR. RICHARD C. CABOT. A physician's contribution to the conduct of life. Out of the remedies tried in all ages, Dr. Cabot has selected four—work, play, love, and worship—because in his experience they have proved their healing power and because they prevent as well as cure. An ideal gift for the Christmas season. $1.50 *net.*

THE JOYFUL HEART

By ROBERT HAVEN SCHAUFFLER. Written with the dash, humor and originality which made his "Musical Amateur" so successful. $1.25 *net.*

BYWAYS IN BOOKLAND

By WALTER A. MURSELL. In this book Stevenson, Dickens, Borrow and many others are dealt with in a sympathetic way. $1.25 *net.*

THE HOME BOOK OF GREAT PAINTINGS

By ESTELLE M. HURLL. Informal talks on the greatest pictures of Michelangelo, Titian, Raphael, Correggio, Van Dyck, Rembrandt and Murillo. 105 *illustrations.* $3.50 *net.*

A CENTURY'S CHANGE IN RELIGION

By GEORGE HARRIS. A comparison of religious beliefs and practices of to-day with those of the first half of the nineteenth century. $1.25 *net.*

IS CONSCIENCE AN EMOTION?

By HASTINGS RASHDALL. In three able and scholarly lectures, this work discusses the question, "Why do we approve some kinds of conduct and condemn others?" $1.00 *net.*

RIVERSIDE POPULAR BIOGRAPHIES

Biographies of famous men in attractive, inexpensive editions

GROUP A

The Life and Times of Cavour
By WILLIAM ROSCOE THAYER

"The most critical study of Cavour that has appeared in any language."—*The Nation.* 2 vols. $3.00 *net.*

By HELEN DAWES BROWN. Straight-to-the-point talks full of sensible advice given in a sympathetic way that strongly appeals to girls. 75c *net.*

THE BOYS' BOOK OF BATTLES

Forty vivid, thrilling battle scenes, from Ancient Egypt to Europe of to-day, described in prose and poetry. Every selection will be read with the tensest interest both by young and old. Profusely illustrated with reproductions from great historical paintings. $2.00 *net.*

Let the Postal Solve Your Life - Insurance Problem

Photo. by Pach
CLEVELAND

Get a policy, and then hold on to it. It means self-respect, it means that nobody will have to put something in a hat for you or your dependent ones if you should be snatched away from them.

Photo. by Pach
ROOSEVELT

Life Insurance increases the stability of the business world, raises its moral tone and puts a premium upon those habits of thrift and saving which are so essential to the welfare of the people as a body.

Deciding upon the **kind** of life insurance policy to take out, like the purchasing of a home, whose permanent maintenance that policy makes certain, should not be a hasty matter; it is most important.

You cannot resolve too quickly that you will take out **some** kind of a policy. Read what four distinguished Americans say, but consider carefully **just what kind** will best meet your needs.

Photo. by Pach
TAFT

A man in office without means must abandon the hope of making the future of his family luxuriously comfortable. All a man can do under existing circumstances to safeguard his family is to get his life insured.

Photo. by Pach
WILSON

If a man does not provide for his children, if he does not provide for all those dependent upon him, then he has not opened his eyes to any adequate conception of human life.

Service

Your decision as to **which** policy is best will not take long if you go about it in the right way—the **direct** way—as made possible for you by the Postal Life Insurance Company.

It sends no agent to bother you, but it forwards **by mail** full **official** information **regarding** any standard policy-form.

The Company will also send you on approval the policy itself, so that you can see **just what you will get**, and when you are once a policyholder it will continue to be at your service for consultation and advice—personally or by letter—which also includes the service of the Company's **Health Bureau for policyholders.**

Saving

Besides **service** you will find net cost low in the Postal because **you** get the benefit of **the agent's first-year commission**—a substantial saving guaranteed in your Policy.

In **subsequent** years you get the agent's **renewal commission,** namely 7½%, and you also receive an **office-expense saving** of 2%, making up the

Annual Dividend of

9½%

Guaranteed in the Policy.

Beginning at the close of the second year the Postal pays contingent dividends besides, depending on earnings.

The Postal does away with numerous branch offices and various unnecessary State requirements.

Safety

The Postal is **safe** because it sets aside the full **reserves required by** law and necessary for the payment **of all policy claims,** now and in the future.

In addition to this legal reserve—now **more than $9,000,000,** invested in interest-bearing securities—the Postal carries a **surplus** and has **ample funds** at interest in leading banks, and a **special deposit of $100,000.00** with the State of New York, where the Company is chartered.

Though less than ten years old, it now pays—and promptly—**more than a million dollars a year** to beneficiaries throughout the Union and elsewhere, under policies issued through the Company's **direct** non-agency method of doing business and under those assumed in its reinsurances.

For You and Yours

It will pay you to write to-day for the Company's Official Booklet, ***"SOUND INSURANCE PROTECTION AT LOW NET COST,"*** also official figures for your own age, on any form of policy—**Whole-life, Limited-Payment Life, Endowment, Joint-Life, Child's Welfare,** or on a **Monthly Income Policy.**

The Postal issues all the standard forms and all these are approved by the strict New York State Insurance Department.

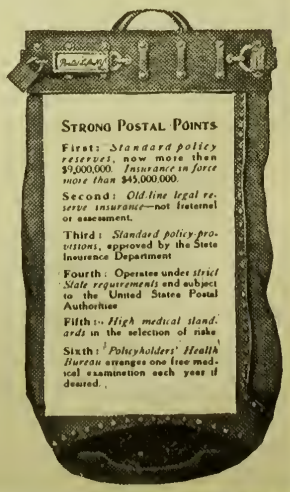
Just write and say:

"Mail official insurance particulars as per THE NATION of December 3d"

And to find out how much you save, be sure to give:

1. Your full name. 2. Your occupation. 3. The exact date of your birth

No agent will be sent to visit you. The Commission-savings thus resulting go to **you** because you deal **direct.**



STRONG POSTAL POINTS
First: Standard policy reserves, now more than $9,000,000. Insurance in force more than $45,000,000.
Second: Old-line legal reserve insurance—not fraternal or assessment.
Third: Standard policy provisions, approved by the State Insurance Department
Fourth: Operates under strict State requirements and subject to the United States Postal Authorities
Fifth: High medical standards in the selection of risks
Sixth: Policyholders' Health Bureau arranges one free medical examination each year if desired.

Appleton's Books for Gifts and General Reading

Two Exquisite Christmas Stories

By Robert W. Chambers

These two delightful stories, "Anne's Bridge" and "Between Friends," by America's most popular story-teller, are full of the spirit of Christmas. They are illustrated with full-page pictures and head and tail pieces, daintily bound in green silk cloth, and encased in a handsome holiday gift box. These stories, especially prepared for gift purposes, have the added attraction of never having appeared in print in any form.

Sold only as a set. $2.00 *net the set.*

AMERICANS and the BRITONS

By Frederick C. De Sumichrast

A timely book discussing the differences between the American and British social order; Education; Foreign Relations; Journalism; Feminism; Patriotism; Militarism, and many other important subjects of interest to all English-speaking people. Professor Sumichrast is frank to point out the manifest defects in Democracy, giving us a splendid opportunity to see ourselves as a Briton sees us, denies we are "braggarts," and concludes with a very hopeful outlook for the future. Few books are more timely, none more frank.

$1.75 *net.*

INSURGENT MEXICO

By John Reed

This is the true story of the Mexico of to-day, showing the peon in war and in peace; intimately portraying the character of this little-understood people and their leaders; describing many of the scenes along the march of Villa's victorious army, and offering to the reader the only up-to-date and accurate account of the Mexican situation available.

$1.50 *net.*

FORTY YEARS OF IT

By Brand Whitlock

Formerly Mayor of Toledo. Now United States Minister to Belgium.

The autobiography of one of the greatest leaders of Democracy in the Middle West; a man who was thrice Mayor of Toledo, and is now Minister to Belgium, the centre of the greatest war tragedies the world has ever known.

$1.50 *net.*

ALBANIA

By Wadham Peacock

An authoritative and timely volume on this little known country that suddenly has become one of the most important in the European situation. The author was formerly British Consul General in Albania and what he has written may safely be accepted as authentic, first hand information.

Illustrated. 8vo. $2.50 *net.*

THE WAR IN EUROPE

By Albert Bushnell Hart

Professor of the Science of Government, Harvard University.

Dr. Hart carefully analyzes the race hatreds, national rivalries, and other causes which brought about the war, the psychology of the war, the questions of neutrality, the methods of modern warfare, the probable outcome, and the effect upon the United States. A fair and impartial book from the American point of view.

Cloth, $1.00 *net.*

WITHIN PRISON WALLS

By Thomas Mott Osborne

This book contains an absolutely faithful account of the experiences of the author as voluntary convict No. 33,333x in Auburn Prison. Mr. Osborne has just been appointed warden of Sing Sing Prison and a study of this volume will give the reader a splendid idea of the reforms in prison administration that are about to be put into actual practice there.

$1.50 *net.*

THE WAR AND AMERICA

By Hugo Münsterberg

Professor of Psychology, Harvard University.

In this authoritative work on the great European War, the noted author, who is at home alike in Europe and America, shows one side of the war, its real motives and issues and their important meaning for our country. There are specially interesting chapters on the Kaiser and the German point of view.

Cloth, $1.00 *net.*

WASHINGTON: The Man of Action

Text by **Frederick Trevor Hill.** Pictures in color by J. O. B. (J. O. de Breville)

A splendid holiday biography of Washington, superbly illustrated by the famous French artist known to art lovers the world over as JOB. The volume is the most attractive and probably the most interesting pictorial life of Washington which has been made.

Quarto. In a box. $5.00 *net.*

THOMAS Y. CROWELL COMPANY, NEW YORK

THE EAST I KNOW

A Translation of *La Connaissance de l'Est*, by PAUL CLAUDEL, made by Teresa Frances and William Rose Benét.

THE EAST I KNOW is a series of prose poems of life in the Far East, showing the brilliant range of the poet's moods and the individuality of his expression. This is the first of M. Claudel's work to appear in English, and the action of the Yale University Press in producing it is expressly authorized by him.

12mo. Cloth binding. 199 pages. Price, $1.25 net, postpaid.

MEMORIALS OF EMINENT YALE MEN

A Biographical Study of Student Life and University Influences during the Eighteenth and Nineteenth Centuries. By the Rev. ANSON PHELPS STOKES, Secretary of Yale University.

"Here is a little library of the choicest kind of biographical literature accompanied by notes, introductions, and illustrations of great value, which not only the Yale brotherhood but all the intelligent men and women of our country may read with both profit and delight."—*The Hartford Courant.*

Library edition. Royal 4to. Cloth binding. Gilt top. 2 volumes. Vol. I, 368 pages; Vol. II, 452 pages. Index. Boxed, per set, $10.00 net, postpaid. Limited edition on English hand-made paper. With reproductions of rare early prints of Yale College. Boxed, per set, $25.00 net, postpaid.

WILD LIFE CONSERVATION IN THEORY AND PRACTICE

By WILLIAM T. HORNADAY, Director of the New York Zoölogical Park.

This book contains the story back of Dr. Hornaday's other books, as "Camp-Fires in the Canadian Rockies." Like all his work, literary or executive, it illustrates his profound knowledge of animals and his warm love for them—an affection which, without wasting itself in sentimentality, has spurred him to an active campaign for the preservation of birds and beasts. An interesting feature of the book is a chapter on private game preserves by Frederic C. Walcott, owner of a successful reserve in Norfolk, Conn. *12mo. Cloth binding. 230 pages. 14 illustrations. Index and bibliography. Price, $1.50 net, postpaid.*

THE CHALLENGE OF FACTS AND OTHER ESSAYS

By the late WILLIAM GRAHAM SUMNER, LL.D., Professor of Political and Social Science, Yale University. Edited with an introduction by ALBERT GALLOWAY KELLER, Ph.D.

This, the third volume of the essays of Professor William Graham Sumner, has just appeared. Characteristic of its author, it shares the power and thought-provoking force of the two earlier volumes, with which it is uniform:

"War and Other Essays."
"Earth Hunger and Other Essays."

Each volume: *8vo. Cloth binding. Gilt top. (About 375 pages.) Price $2.25 net, postpaid.*

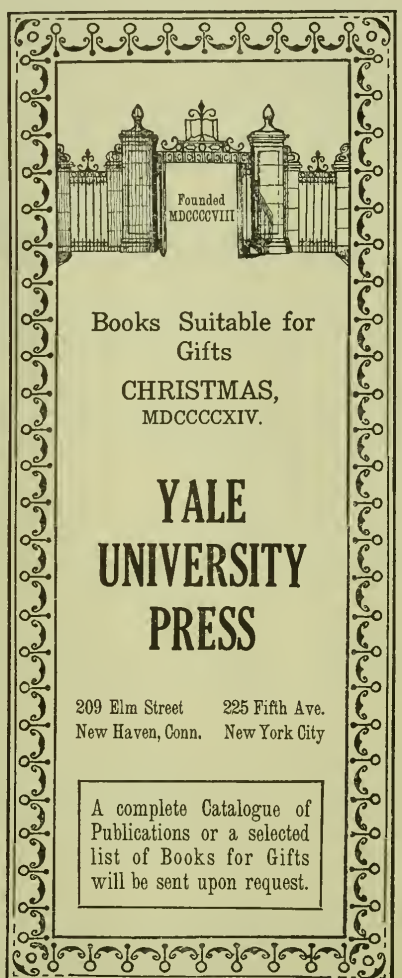
THE FALCONER OF GOD AND OTHER POEMS

By WILLIAM ROSE BENÉT.

"A new poet will go far who is able to write searching lines like these. . . . His poetry is chiefly full of the insight, the outlook, which are the true singer's hall-marks." *12mo. Board binding. 122 pages. Price, $1.00 net, postpaid. Limp leather binding, $1.50 net, postpaid.*

SOME TEXTUAL DIFFICULTIES IN SHAKESPEARE

By CHARLES D. STEWART. (Published under the Auspices of the Elizabethan Club.) *12mo. Cloth binding. 230 pages. Index. Price, $1.35 net, postpaid.*



THE SONG OF ROLAND

Translated into Metrical Verse by LEONARD BACON, Instructor in English at the University of California.

The spirit of the times when

"For seven years together, the Emperor Charlemagne,
Our Lord and King, had sojourned within the land of Spain.
From the upland to the sea-coast he had conquered all the land
Nor was there any castle before him left to stand,"

is well caught in this new rendering of the old *chanson de geste*. Mr. Bacon's manuscript is considered remarkable by those best fitted to judge its merits, not alone because of his accurate translation of old French, but also because of his preservation of the poetry and charm of the original work. *8vo. Board binding. 185 pages. Price, $1.50 net, postpaid.*

THE FUNDAMENTAL BASIS OF NUTRITION

By GRAHAM LUSK, M.D., Professor of Physiology, Cornell University Medical College and Scientific Director of the Russell Sage Institute of Pathology.

"Professor Lusk's little book furnishes the clearest exposition we have seen of food values and their relation to the cost of living. The chief aim of the work seems to be to enable the family of small income to select the foods highest in nutriment at the lowest expense."—*Scientific American.* (*Second Printing.*) *12mo. Cloth binding. 62 pages. Index. Price, 50 cents net, postpaid.*

NATHAN HALE, 1776

Biography and Memorials

(*Revised and Enlarged Edition.*)

By HENRY P. JOHNSTON, Professor of History at the College of the City of New York.

One of the most attractive heroes of our Revolution is here drawn by one who is held an authority on that period of history and who has further especially interested himself in the career of Nathan Hale for many years. The inclusion of a number of Hale's poems and letters never before printed gives unique charm and reality to the book. *8vo. Board binding. 265 pages. Frontispiece. Index. Appendices. Price, $2.35 net, postpaid.*

SCIENCE AND RELIGION

The Rational and the Superrational

An Address delivered before the Phi Beta Kappa Association in the City of New York by Professor Cassius J. Keyser, Adrain Professor of Mathematics at Columbia University. *12mo. Cloth binding. Gilt top. 80 pages. Price, 75 cents net, postpaid.*

ESSAYS ON MILTON

By ELBERT N. S. THOMPSON, Ph.D., Assistant Professor of English at the State University of Iowa. *12mo. Cloth binding. 220 pages. Index. Price, $1.35 net, postpaid.*

BURLINGAME PUBLIC LIB.

Books for the Holidays

J. B. LIPPINCOTT COMPANY

PUBLISHERS PHILADELPHIA

ILLUSTRATED HOLIDAY CATALOGUE MAILED ON REQUEST

THE PRACTICAL BOOK OF OUTDOOR ROSE GROWING

By GEORGE C. THOMAS, Jr.

96 perfect reproductions in full-color of all varieties of roses. Octavo. Cloth. In a box. $4.00 net. Postage extra.

The rose-lover and the rose-grower should be keenly interested in this beautiful and comprehensive book on roses. The exquisite illustrations and general attractiveness of the volume make it a practical gift book for any one engaged in flower-culture.

THE PRACTICAL BOOK OF PERIOD FURNITURE

By HAROLD DONALDSON EBERLEIN and ABBOT McCLURE

250 illustrations. Octavo. Cloth. In a box. $5.00 net. Postage extra.

A practical book for those who wish to know and buy period furniture. It contains all that it is necessary to know about the subject. By means of an illustrated chronological key (something entirely new) one is enabled to identify the period to which any piece of furniture belongs.

OUR PHILADELPHIA

By ELIZABETH ROBINS PENNELL. *Illustrations by JOSEPH PENNELL.*

(Regular Edition.) 105 illustrations from lithographs. Quarto. In a box. $7.50 net.

(Autographed Edition.) Signed by both author and artist, with ten additional lithographs. Special buckram binding in a box. $18.00 net. Carriage charges extra. (This edition limited to advance subscribers.)

An intimate personal record in text and in picture of the lives of the famous author and artist in the city whose recent story will be to many an absolute surprise. Mr. Pennell's illustrations, made especially for this volume, are the greatest he has yet accomplished.

HEROES AND HEROINES OF FICTION

By WILLIAM S. WALSH

Half morocco. $3.00 net. Postage extra.

Mr. Walsh has compiled the famous characters and famous names in modern novels, romances, poems and dramas. These are classified, analyzed and criticised and supplemented with citations from the best authorities. A valuable, interesting reference book.

COLONIAL MANSIONS OF MARYLAND AND DELAWARE

By JOHN MARTIN HAMMOND

Limited edition, printed from type, which has been distributed. With 65 illustrations. Octavo. In a box, $5.00 net. Postage extra.

A handsome volume that will delight all lovers of fine editions. Uniform in style and price with others in the Limited Edition Series—"Colonial Homes of Philadelphia," "Manors of Virginia," etc., all of which are now out of print and at a premium.

THE ROMANCE OF THE BEAVER

By A. RADCLYFFE DUGMORE

Illustrated with photographs. $2.50 net. postage extra.

Few people possibly realize that the American Beaver is one of our most interesting native animals. Mr. Dugmore tells everything worth knowing about them, and this new work will delight the stay-at-home as well as the out-of-doors man.

THE NIGHT SIDE OF JAPAN

By T. FUJIMOTO

40 illustrations from photographs and drawings in color and tone by Japanese artists. Octavo. Cloth, $2.50 net.

This is a book full of interest, combining as it does an account of modern European life in Japan which is still strongly mixed up with the quaint primitive customs of Old Japan. The author is a native of Tokyo, with a knowledge of English, and he describes both town and peasant life with much quaintness and vivacity.

GIVE A BOY ONE OF THE TRAIL BLAZERS SERIES

BUFFALO BILL AND THE OVERLAND TRAIL

By EDWIN L. SABIN. *Illustrated. $1.25 net. Postage extra.*

An inspiring, wonderful story of the adventures of a boy during those perilous and exciting times when Buffalo Bill began the adventurous career that has indissolubly linked his picturesque figure with the opening of the west to civilization. They were the romantic days of the Overland Trail, the Pony Express, and the Deadwood Coach. In the same series, "WITH CARSON AND FREMONT," "ON THE PLAINS WITH CUSTER," "DAVID CROCKETT, SCOUT," "DANIEL BOONE, BACKWOODSMAN," "CAPTAIN JOHN SMITH."

STORIES ALL CHILDREN LOVE SERIES

THE CUCKOO CLOCK

By MRS. MOLESWORTH

8 full-page illustrations in color by Maria L. Kirk. Ornamental cloth. $1.25 net.

This famous book is one of the most delightful children's stories ever written. The story has much of the charm of "Alice in Wonderland," and can justly be called a classic. The boy or girl who does not read it misses one of the greatest treats of childhood.

IN THE SAME SERIES:

"THE SWISS FAMILY ROBINSON," "THE PRINCESS AND THE GOBLIN," "AT THE BACK OF THE NORTHWIND," "THE PRINCESS AND CURDIE," "THE CHRONICLES OF FAIRYLAND," "HANS ANDERSEN'S FAIRY TALES," "A DOG OF FLANDERS," "BIMBI," "MOPSA, THE FAIRY."

WONDERLAND STORIES

From Robinson Crusoe, The Wonder Book, Swiss Family Robinson, Alice in Wonderland and Gulliver's Travels.

Simplified by ELIZABETH LEWIS. *Profusely illustrated. Cloth. $0.50 net.*

Into this volume of twenty standard stories have been gathered some of the gems of child literature. They have been tried by the test of time and found to contain an unfailing spring of delight. They are read with the same keen zest by each succeeding generation of children and should be a part of the education of all young people. In the same series, "THE PRINCESS AND THE GOBLIN," "THE PRINCESS AND CURDIE," "AT THE BACK OF THE NORTH WIND."

CHARMING CHRISTMAS BOOKS

BETTY'S VIRGINIA CHRISTMAS

By MOLLY ELLIOT SEAWALL

Four illustrations in color by Henry J. Soulen. Page Decorations. 12mo. Cloth, decorated in green and gold. $1.50 net. Postage extra.

A Southern story that carries the true spirit of Christmas to the hearts of young and old. To the tune of Dixie fiddles there is a rout of festive dances, early morning fox-hunts, and spirited feasts of turkey, egg-nog and the other delicious dishes for which Virginia cooks and Virginia farms are rightly famous.

OUR SENTIMENTAL GARDEN

By AGNES and EGERTON CASTLE

Illustrated in color by Charles Robinson. Head and tail pieces and decorative lining papers. Octavo. Cloth. $1.75 net. Postage extra.

This book is a sheer delight, filled with the whims and fancies of garden-lovers. The authors have caught the note of family life in a picturesque old English dwelling, where grown-ups and children live largely out of doors, and where birds and animals and bees and flowers become of a most human comradeship. If one can not own such a sentimental garden the next best thing is to know all about one.

THE TRUE ULYSSES S. GRANT

By GENERAL CHARLES KING

24 illustrations. Octavo. Buckram. $2.00 net. Half levant. $5.00 net. Postage extra.

This new volume in the True Biography and History Series is the work of a writer peculiarly fitted to deal with Grant. Not only Grant, the general, but Grant the man, and Grant, the President, are treated with the same regard for truth that characterizes all the volumes in the series.

ESSAYS, POLITICAL AND HISTORICAL

By CHARLEMAGNE TOWER, LL.D.

Former Minister of the United States to Austria-Hungary. Ambassador to Russia and to Germany. $1.50 net. Postage extra.

Essays upon vital subjects by one of our greatest figures in the diplomatic world will demand instant attention. The book will be widely read for its important revelations in the light of the present disturbed conditions.

THE MYSTERY OF THE ORIENTAL RUG

By Dr. G. GRIFFIN LEWIS

Frontispiece in color and 30 full-page plates. $1.50 net. Postage extra.

This charming book is compact with information and no one should buy rugs without its aid.

GOOD FICTION FOR THE CHRISTMAS FIRESIDE

THE WARD OF TECUMSEH

By CRITTENDEN MARRIOTT. *Illustrated. $1.25 net. Postage extra.*

PHILADELPHIA PRESS:

"Historical romance will never lose its fascination as long as such vivid, picturesque and wholly entertaining tales as this are forthcoming. For 'The Ward of Tecumseh' combines the thrill and excitement of a red-blooded Western story with the compelling interest of historic narrative."

THE THREE FURLONGERS

By SHEILA KAYE-SMITH. *Frontispiece. $1.25 net. Postage extra.*

NEW YORK TIMES:

"Her story is written with such sincerity of feeling and appreciation of moral beauty and contains so much human truth that the author deserves warm commendation. An achievement worth while."

THE DUKE OF OBLIVION

By JOHN REED SCOTT. *Frontispiece. $1.25 net. Postage extra.*

NEW YORK TIMES:

"There are plots and counter-plots, hand-to-hand fights, and many thrilling adventures . . . until the end the reader is kept in a high state of doubt as to whether or not they will all escape in safety."

OXFORD UNIVERSITY PRESS AMERICAN BRANCH

American College and University Series

General Editor, GEORGE PHILIP KRAPP.

Crown, 8vo, cloth, gilt top. With illustrations.

"The peculiar merits of this series are charm and accuracy. The books are not only informative, but interestingly written."—*Boston Transcript.*

For the Alumnus For the one at College
For the one who will go to College

HARVARD By JOHN HAYS GARDINER. **$1.50**

The author was connected with Harvard all his life and is well qualified to speak with authority as to her history, the student body and their customs, and what the university really stands for.

COLUMBIA By FREDERICK PAUL KEPPEL. **$1.50**

"Unlike many historical books about colleges, it is not only carefully written but very interesting. Will be enjoyed, not only by graduates of Columbia, but by all who are interested in the progress of higher education and in university life in this country."—*The Outlook.*

PRINCETON By VARNUM LANSING COLLINS **$1.50**

"Should prove of special interest to Princeton men, past, present and prospective, and it also should have a vital interest for all concerned in any way with higher education in America."—*Newark Evening News.*

Other Volumes in Preparation.

SHORT STORIES IN THE MAKING

By ROBERT WILSON NEAL. Crown 8vo, cloth, pp. xi + 261. **60 cents**

A writers' and students' introduction to the technique and practical composition of short stories, including an adaptation of the principles of the stage plot to short story writing.

OXFORD BOOK OF AMERICAN ESSAYS

Chosen by BRANDER MATTHEWS. Crown 8vo, cloth, gilt top. 508 pages. **$1.25**

A collection of essays from the work of twenty-eight American authors. Each essay is complete in itself, except one where an unimportant preface is omitted.

REPRESENTATIVE ENGLISH DRAMAS FROM DRYDEN TO SHERIDAN

By FREDERICK TUPPER and JAMES W. TUPPER. Crown 8vo, cloth, pp. iv + 461, **$1.25**

Shows the development of the drama between the Restoration of the Stuarts and the American Revolution by presenting in chronological order twelve representative plays written during that period. Before each play is a sketch of the author's life and works and at the end of the book are notes on the text and a bibliography which will serve as a guide to further study of each author.

THE SUN-THIEF AND OTHER POEMS

Crown 8vo, cloth, pp. vi + 152. **Net, $1.50**

"The poet has noble powers of imagination and varied poetic gifts."—*Glasgow Herald.*

"Throughout the book, the singer's inspiration is new and full of life. . . The volume will be read with a hearty interest by studious lovers of poetry."—*Scotsman.*

WHY WE ARE AT WAR. Great Britain's Case

By MEMBERS OF THE OXFORD FACULTY OF MODERN HISTORY, with an Appendix of Original Documents, including the Authorized English Translation of the White Book issued by the German Government, printed in full, and The Russian Orange Book and The Belgian Grey Book, printed in French.

Contains careful historical explanation of the establishment of the neutrality of Belgium and Luxemburg, the origin of the Triple Entente and a full account of the diplomatic events preceding the outbreak of the war.

"Deserves all the praise that can be given to it."—*Athenaeum.*

Third edition, revised, 8vo, cloth. 264 pages. **85 cents**

A LARGE SCALE WAR MAP

In two parts. WESTERN SHEET, size 60x60 inches, showing Western and Central Europe West of Berlin. EASTERN SHEET, size 40x60 inches, showing Central Europe East of Berlin.

Scale 1:1,000,000. Printed in two colors, showing physical features, frontiers, the principal strategic railways, fortresses and important towns. Mounted on canvas to fold flat, complete, **$5.00.** Unmounted, complete, **$3.40.**

THE LEGISLATIVE UNION OF ENGLAND AND SCOTLAND

The Ford Lectures delivered in Hilary Term, 1914.

By P. HUME BROWN. 8vo, cloth, pp. xii + 208. **$2.50**

Contents: The Political State of Scotland at the Accession of Anne—Prospects of Union—The Act of Security—Succession or Union—The Treaty of Union—Threatened Undoing of the Union.

THE FALL OF CANADA: A Chapter in the History of the Seven Years' War

By GEORGE M. WRONG. 8vo, cloth, pp. 272. With 7 Maps and 5 Plates. **$2.90**

Of interest to all students of American history, for the period with which it deals was pregnant with far-reaching consequences to the political status of the North American Continent, such as the establishment of the Dominion of Canada, the American Revolution, and the founding of the United States.

A HISTORY OF THE PENINSULAR WAR. Vol. V Covering the period between Oct. 1811 and Aug. 31, 1812

By CHARLES OMAN. Crown 8vo, cloth, pp. viii + 636. With Maps and Illustrations. **$4.75**

"The campaign of 1812 cannot be called the greatest exhibition of military genius in Wellington's career. . . . But it included the battle of Salamanca, the most skilfully fought and the most decisive of all his victories, 'the beating of forty thousand men in forty minutes.'"—*From the Preface.*

THE AUXILIA OF THE ROMAN IMPERIAL ARMY

By G. L. CHEESMAN. 8vo, paper boards, pp. 192. **$1.75**

"An attempt to deal with an interesting branch of Roman military history which has not previously been made the subject of an independent treatise."—*From the Preface.*

THE PARTITION OF EUROPE. A Textbook of European History, 1715-1815

By PHILIP GUEDALLA. Crown 8vo, cloth, pp. viii + 312. Seven Maps. **$1.10**

"Geography is the foundation of all diplomacy and of all strategy, and I have tried to indicate its influence on the direction of policy, the trace of frontiers, and the march of armies."—*From the Preface.*

Luca della Robbia
By ALLAN MARQUAND

This volume, the third of the Princeton Series of Monographs in Art and Archæology, presents a Catalogue Raisonné of the works of Luca della Robbia.

The monuments are arranged in chronological sequence together with their related documents and bibliography. Some of the monuments and some of the documents are now published for the first time.

This book will be found of value to all lovers of art, and is well printed on dull coated paper and attractively bound, so that it makes an exceptionally beautiful gift book.

"It is an admirably complete and scholarly monograph on one of the most charming phases of Italian Art that can be read with interest by the neophyte and must be taken as an authority by the student."—*N. Y. Sun.*

326 *pages, quarto,* 186 *illustrations, cloth, boxed,* $7.50 *net, by mail* $7.62.

Della Robbias in America
By ALLAN MARQUAND

This volume, the first of the Princeton series of Monographs in Art and Archæology, is by the Senior Professor of Art and Archæology in Princeton University. It presents in the form of a descriptive catalogue an account of the seventy-three works of the Della Robbia school of sculpture which are now in public or private collections in the United States.

"It is of course of especial interest to collectors, but the illustrations and the admirable method of criticism make it valuable to any student of art."—*Boston Transcript.*

198 *pages, quarto,* 72 *pages of illustrations, cloth, boxed,* $4.50 *net, by mail* $4.60

The Doctrine of Judicial Review
By EDWARD S. CORWIN

A series of studies that should be of great interest to students of political theory and American Constitutional History and Law.

The opening essay, comprising seventy-eight pages of the volume, deals with the legal and historical basis of the power of courts to pronounce statutes invalid as conflicting with the Constitution. The second essay, entitled "We, the People," discusses the question of the ratification of the Constitution from what is shown to be the point of view of 1787. The themes of the other studies appear from their titles: The Pelatiah Webster Myth; The Dred Scott Decision; Some Possibilities in the Way of Treaty-Making.

188 *pp., 12mo, cloth,* $1.25 *net, by mail* $1.33

The Balkan Wars—1912-1913
By JACOB GOULD SCHURMAN

The present war had its origin in the Balkan situation. This volume will prove helpful to readers who seek light on the underlying condition, the causes, and the consequences of those struggles.

"It will prove invaluable to the man in business or in an engrossing profession who desires to gain some idea of the events which led to the immediate outbreak of the present European war."—*Princeton Alumni Weekly.*

144 *pages, 12mo, cloth, maps,* $1.00 *net, by mail* $1.06

Foreigners in Turkey: Their Juridical Status
By PHILIP MARSHALL BROWN

"The newspaper reader following the report of Turkey's abrogation of special rights of foreigners may find in this essay facts that will furnish foundation for a clearer understanding of the crowding events of the day."—*New York Sun.*

166 *pp., 12mo, cloth,* $1.25 *net, by mail* $1.32

Experiments in Government and the Essentials of the Constitution
By ELIHU ROOT

"Concise, forceful arguments against the initiative, the compulsory referendum, the recall of officers, and the popular review of judicial decisions, on the ground that they subvert the essential principles of the Constitution."

88 *pp., 12mo, cloth,* $1.00 *net, by mail* $1.06

Biblical Libraries
By ERNEST CUSHING RICHARDSON

Mr. Richardson in this volume gives a sketch of library history from 3400 B. C. to A. D. 150. A glance at the following table of contents will show the attractiveness of the book: The Babylonian Period; The Patriarchal Period; The Egyptian Period; The Exodus; Palestine at The Conquest; Period of the Judges; Saul to The Captivity; The Persian Period; The Greek Period; New Testament Times in Palestine; Roman Libraries in Apostolical Times; Post-Apostolical Roman Library Buildings; The Bible Itself a Library.

268 *pages, 16mo,* 30 *plates, cloth,* $1.25 *net, by mail* $1.33

The Beginnings of Libraries
By ERNEST CUSHING RICHARDSON

"Though Mr. Richardson's book was written avowedly for librarians and library students, it contains many facts and opens up many avenues of speculation that will prove of interest to the layman."—*New York Times.*

186 *pages, 16mo, illustrated, cloth,* $1.00 *net, by mail* $1.06

The Two Hague Conferences
By JOSEPH H. CHOATE

"The two chapters of this book were the Stafford Little Lectures of 1912 at Princeton University. No better interpretation of the Two Hague Conferences, their work and significance, and promise of large, lasting influence on the world has appeared than is found in these pages. Indeed, of the briefer books we do not hesitate to say that this is the best, so far as we have seen. . . . Students of the Hague Conferences cannot do better than to begin their studies with Mr. Choate's lectures."—*The Advocate of Peace.*

124 *pp., 12mo, cloth,* $1.00 *net, by mail* $1.06

Virginia Under the Stuarts
By THOMAS J. WERTENBAKER

"This is one of the most interesting volumes that has been brought out on the history of this state."—*Atlanta Constitution.*

"Sets the facts before the reader in a manner that makes his history fascinating reading."—*Boston Transcript.*

Not in the least ephemeral, but standard history, the result of a life-time of labor by an able and devoted author; comprehensive though compact; logical in arrangement and academic in execution; the only work of the kind published in any language.

HISTORY OF MEXICO

By HUBERT HOWE BANCROFT

In one vol., 581 pages, over 200 maps and illustrations

The work covers ten centuries of aboriginal culture well authenticated in hieroglyphic manuscripts and architectural remains; the conquest by Cortés, seemingly thrilling romance rather than substantial history; 300 years of colonial régime under 72 Spanish governors, audencias, and viceroys; then independence from Spain and nearly 100 years of republicanism, with attendant imperialism, intervention, and over 250 internal revolutions, the end not yet in sight.

In graphic pages the book brings up the past, describes the present, and contemplates the future.

At the bookstores, net, $2. With RETROSPECTION and NEW PACIFIC in box, $6.
A superb and timely gift—timely in view of Panama Canal and west coast Expositions

Spanish Commercial Reader

Edited, with Notes and Vocabulary, by E. S. HARRISON, Head of Modern Language Department, Commercial High School, Brooklyn, N. Y. Price, 90 cents.

THE aim of this reader is to enable students of Spanish who desire to use the language in business to become thoroughly familiar with the business forms and terms and with the commercial customs of Spanish-speaking countries.

The text is divided into three parts: I, Business Stories (a new feature in texts of this kind); II, General Articles; and III, Business Forms.

The accentuation is that authorized by the latest (1911) edition of the grammar of the Spanish Academy.

THE CULTURE OF ANCIENT ISRAEL

By CARL H. CORNILL.

Pp. 200, 8vo; cloth. Price $1.00.

"No writer on Old Testament times has set forth his theme more picturesquely than Cornill. There is something intensely lifelike and oftentimes dramatic in the presentation of his subject. Thoroughly scholarly in his spirit, he is popular in his manner and this new book is a strong addition to his two noted works on 'The History of Israel' and 'The Prophets.' In this little volume he has collected what seems to be five popular essays dealing with the culture of Israel as it is seen in the Old Testament."—*Boston Transcript.*

A SELECTED LIST FOR CHRISTMAS GIFTS

For Present Pleasure and Permanent Keeping

By Mme. L. de Hegermann-Lindencrone — **THE SUNNY SIDE OF DIPLOMATIC LIFE**
The author of "In the Courts of Memory" has written in this new volume reminiscences of her life as a diplomat's wife in five great capitals. *Illustrated. $2.00 net.*

By Gertrude Atherton — **CALIFORNIA. AN INTIMATE HISTORY**
The California of to-day, and the California of yesterday with its picturesque story, are set forth in this only complete short history of the State by the one writer who could bring to it the skill united with that love for the task of a Californian-born—Gertrude Atherton. *Illustrated. $2.00 net.*

LIFE IN AMERICA ONE HUNDRED YEARS AGO — **By Gaillard Hunt**
"A welcome contribution to the popular historical literature of our country. Comprehensive, thorough, this picture of the customs, tastes, politics, fashions, amusements, social life, and other phases of the daily existence of the America of a hundred years ago is always light in manner, with an unfailing vein of appreciation of the humorous as well as the serious side of things."—*N. Y. Tribune.* *Illustrated. $1.50 net.*

WITH SABRE AND SCALPEL — **By Dr. John Allan Wyeth**
In this volume of reminiscences the well-known New York physician recounts the interesting events of his stirring life. He has been farmer, Confederate soldier, cotton-planter, medical student, river pilot, doctor, twice President of the New York Academy of Medicine, and founder of the New York Polyclinic. *Illustrated. $3.00 net.*

FAMOUS AFFINITIES OF HISTORY — **By Lyndon Orr**
The great romances of the world—the stories of Antony and Cleopatra, Queen Elizabeth and Leicester, Catharine of Russia and Prince Potemkin, and many others—are told here in a style piquant with interest, yet so clean that there is nothing to offend. *Illustrated. $2.00 net.*

MUST PROTESTANTISM ADOPT CHRISTIAN SCIENCE? A CHURCHMAN'S VIEW
By Rev. J. Winthrop Hegeman
A bold and earnest document in which a clergyman of the Episcopal Church suggests the adoption by Protestant churches of the essentials of Christian Science. He compares the fruitage of the Christian Scientists' faith with that of the average church; their theology with that of the churches. *12mo. 75 cents net.*

THE ANTI-TRUST ACT AND THE SUPREME COURT — **By Hon. William H. Taft**
Very timely and authoritative is this volume, in which former President Taft discusses in all its bearings the Sherman Anti-Trust Law, the proposed amendment to it, the effect of its decisions upon business in the past, and its probable influence in the future. *Post 8vo. $1.25 net.*

A GUIDE TO GOOD ENGLISH — **By Robert Palfrey Utter**
"A helpful little book and offers in accessible form the facts about the use of the English language which every writer needs to have where he can refer to them."—*Times-Picayune*, New Orleans. Deals with spelling, punctuation, grammar, sentence and paragraph structure, expository and argumentative writing, and prosody. *Post 8vo. $1.20 net.*

THE UNSEEN EMPIRE
By Atherton Brownell
Of unusual, timely interest is this play in which Germany is about to make war upon Great Britain. *Crown 8vo. $1.25 net.*

PARTY GOVERNMENT IN THE UNITED STATES OF AMERICA — **By Prof. William M. Sloane**
A history of American politics, an exposition of party political tendencies in practice. The evolution and development of the different parties are traced back to their beginnings. *Crown 8vo. $2.00 net.*

For Holiday Gifts

By Henry Van Dyke — **THE LOST BOY**
With devotional imagination the author has traced in this novelette the wanderings of "The Lost Boy," separated from His parents in Jerusalem.
16mo, Illustrated, Cloth, 50 cents net; 16mo, Illustrated, Leather, $1.00 net; Octavo, Illustrated in Color, Ornamented Cover, $1.00 net.

By Kate Langley Bosher
HOW IT HAPPENED
"Dickens might have added this delightful Yuletide tale to his list of Christmas stories without lessening his laurels. It sparkles with the light of the Christmastide and throbs with that happy season's gladness."—*Cleveland Christian World.*
Illustrated. $1.00 net.

By Margaret Deland — **THE HANDS OF ESAU**
"Mrs. Deland tells the story with the fresh charm and fine distinction that mark all her work."—*Washington Evening Star.*
"A volume small in size, but large in thought-provoking qualities."—*Boston Transcript.* *$1.00 net.*

By Margaret Turnbull
LOOKING AFTER SANDY
A captivating story of a captivating girl. Sandy is a girl, young and so unusually nice, so childishly appealing, that everybody wants to "look after her"—and everybody does. For all ages a delight. *Illustrated. $1.35 net.*

By Rex Beach — **THE AUCTION BLOCK**
The St. Louis *Republic* says: "Mr. Beach's book stands out, also, by virtue of the humor which he finds in the wicked metropolis. . . . In its healthy optimism, which includes the ability to squeeze a joke out of many a tight corner, 'The Auction Block' is especially American and especially worth while." *Illustrated by C. D. Gibson. $1.35 net.*

By Justus Miles Forman
THE BLIND SPOT
The story of a man who left the heart out of his plans to set the old world running efficiently. The hero, says the New York *Evening Post*, "is the kind of a man Bernard Shaw would have us believe in." *Illustrated. $1.35 net.*

HARPER & BROTHERS, PUBLISHERS, NEW YORK

BOOKS FOR GIFTS

AMONG THE CANADIAN ALPS

By LAWRENCE J. BURPEE

With four full-page color plates and forty reproductions from photographs and six maps. 8vo. Boxed. Cloth. $3.00 net.

The wonderful plan of the laying out of the Canadian National Parks, the old Indian trails and the new mountain roads, the experience of many famous travelers in mountain climbing and the gorgeous scenery of the Rockies are some of the topics in this vastly entertaining and beautifully illustrated volume.

CARILLONS OF BELGIUM AND HOLLAND

Tower Music in the Low Countries
By WILLIAM GORHAM RICE

With 32 illustrations, etc. 12mo. Cloth. $1.50 net.

N. B. The Author will devote his royalty on this edition to the Belgian Relief Fund.

Antwerp's beautiful cathedral, endangered by Zeppelin bombs, and Mechlin's noble tower that has been a mark for German shells in the present devastating European war, are among the belltowers mentioned in this unusual and interesting book.

INDIA'S LOVE LYRICS

By LAURENCE HOPE

With 24 full-page color plates and page decorations by Byam Shaw. Large 8vo. Cloth. $5.00 net.

Laurence Hope's INDIA'S LOVE LYRICS has gone through many editions, and every poem in it has been set to music innumerable times. At last it has inspired an artist to an exhaustive scheme of illustration. Mr. Byam Shaw's pictures are in perfect harmony with the text, rich in Oriental flavor and luxuriant with all the glamour of the East, its light and its color.

THE GOLDEN AGE

By KENNETH GRAHAME

With 19 illustrations in color by J. Enraght-Moony. Crown 4to. Cloth. $3.00 net.

No fitter book could be selected to be decked in holiday dress than Kenneth Grahame's delightful, fanciful "The Golden Age." Mr. Moony in his illustrations has that quality of imaginative treatment which is essential to the book's proper decoration.

THE ENCHANTMENT OF ART

By DUNCAN PHILLIPS

Frontispiece in color, and 8 other illustrations. 8vo. Handsome Cloth. $2.50 net.

Here is just the kind of criticism which Anatole France once called "Romance—the Adventures of the Mind Among Masterpieces." The author is capable of rich enjoyments, and his enthusiasm for art is infectious. The book abounds in keen estimates and sensitive appreciations, and underlying the charm of the writing there is a fine life-enhancing philosophy.

Fiction That Will Live

THE REVOLT OF THE ANGELS

By ANATOLE FRANCE

Translated by Mrs. Wilfrid S. Jackson. Limited Library Edition. 8vo. Cloth. $1.75 net. Popular Priced Edition. 12mo. Cloth. $1.25 net.

This latest novel by the greatest living French stylist presents graphically the irrepressible conflict between science and theology.

"It is difficult to recall a bigger, wittier, or more entertaining satire within the past hundred years. Anatole France is a good-humored Swift."—*New York Times.*

BELLAMY

By ELINOR MORDAUNT

Author of "Simpson," etc. 12mo. Decorated Cloth. $1.35 net.

A remarkably brilliant story of a youth without heart or conscience or morals, imbued only with the great religion of "getting-on."

"It resembles a glass of sherry and bitters—stimulating, leaving a sharp, enjoyable tang behind. Unlike so many novels, 'Bellamy' is worth a careful and attentive reading."—*New York Times.*

AT ALL BOOKSTORES

JOHN LANE CO. NEW YORK

STUDIES IN MILTON AND AN ESSAY ON POETRY

By Alden Sampson, A.M. (Harvard University)

The right of publication in England has been purchased by Mr. John Murray, London.

Illustrated with a wood-cut by Timothy Cole, N.A., from the bust in clay of Milton, at Christ's College, Cambridge, England. 8vo. 320 pp., uncut—$2.00 net.

COMMENTS OF THE PRESS

"The appearance of this book seems to us of happy augury. . . . Mr. Sampson knows his Milton thoroughly, but he loves him even more thoroughly. He writes with the public in view, yet he never descends, either in style or in substance, to a presentation of his great theme that suggests thinness or smartness. On the contrary, fulness of reading and depths of loving meditation are evident on almost every page."—**The Nation, New York.**

"Discursive studies written by a careful Milton scholar in a spirit of enthusiastic appreciation for the pure quality of poetry, as far as possible removed from ordinary dry-as-dust criticism."—**American Library Association Booklist, Chicago.**

"If there should ever be a Miltonic revival, the Recording Angel will doubtless make a large credit entry under the name of Mr. Alden Sampson. His 'Studies in Milton and An Essay on Poetry' is easily the best thing of its kind that has yet been written of the Cromwellian poet. It is so good because Mr. Sampson's heart is evidently in his work. He is not merely a Milton student, but a Milton lover, and therefore he writes not only with knowledge but with reverence."—**The Argonaut, San Francisco.**

"We take it as promising that such a volume as Mr. Alden Sampson has given us is sure and stimulating evidence of rapidly approaching grace and strength in letters. . . . Mr. Sampson, besides realizing the happier truths about Milton and the art and craft of the poets, brings some new lights to bear. . . . (His) estimate of this poet and of all makers of poetry is brilliantly suggestive. . . . Mr. Sampson with this timely book—admirably written, stimulating, and necessary—reminds us of the source of inspiration and spiritual refreshment which is ever in our hands."—**The Saturday Review, London.**

"There will always be room for a book like this inspiring essay, which studies Milton from the point of view of the most refined American culture of these days, a culture which, inheriting its philosophical traditions from the Concord School, and always valuing the finest monuments of English poetry with a reverence akin to that felt by modern men of learning for the masterpieces of the ancient world, has not a little in common with the specific genius of the greatest poet of Puritanism."—**The Scotsman, Edinburgh.**

"Mr. Alden Sampson's 'Studies in Milton' is one of those rare volumes of literary criticism the reading of which leaves us enriched not merely by the possession of the critics' ideas on their subject, but also by new and fresh knowledge of the subject directly. . . . It is a genuine study of the growth and development of Milton's genius and personality as manifested by the chronological order of his works, and the events of his life are only treated by Mr. Sampson in so far as they, directly or indirectly, actually influence his work. . . . The search through Milton's later works for a 'confession of faith' is an alluring task for critic and theologian alike, and Mr. Sampson is peculiarly fitted for the task and does it well. He proves every point by full and apposite quotation, and, to our mind, he has proved his case. . . . The unerring certainty and perspicuous clearness of Mr. Sampson's reasoned judgments upon the most sublime singer of English poetry."—**The Irish Times, Dublin.**

MOFFAT, YARD & CO., 116-120 W. 32d St., New York

INTERNATIONAL PERSPECTIVE IN CRITICISM:

Goethe, Grillparzer, Sainte-Beuve, Lowell

By GUSTAV POLLAK

"It is restorative of one's mental equilibrium to turn aside and linger in this temple of literary concord erected by Austrian, French, German, and American builders who in the higher brotherhood of men worshipped together."—*The Nation.*

THE MACMILLAN COMPANY'S HOLIDAY GIFT BOOKS

The Nation

NEW YORK, THURSDAY, DECEMBER 3, 1914.

Summary of the News

The week has been a quiet one so far as any new political developments in the European situation have been concerned. Even the rumors concerning Italy's intentions have simmered down to the somewhat vague suggestion that she is waiting till the spring before declaring herself, presumably on the side of the Allies, the idea being that there is little chance of the issue of the war being decided in the near future, and that Italy, therefore, though delaying a few months, will still have ample time to enter the fight without her participation savoring too much of eleventh-hour opportunism. The suggestion hardly seems to do justice to the apparently sincere efforts which Italian statesmen have made to preserve the neutrality of their country. Among the Balkan states the decision for peace or war appears, for the present at any rate, to rest with Bulgaria, who so far has exhibited no intention except that of observing absolute neutrality.

The question that arose out of the firing on the Tennessee's launch by Turkish authorities in the harbor of Smyrna has been officially declared to be closed. According to a statement issued by Secretary of State Bryan on November 27, the Turkish Minister of War reported that two blank shots were first fired to warn the launch that it was headed straight for a mine, and that the third shot was only fired "in another direction from that of the launch" to prevent the helmsman of the launch from holding his course. Great regret was expressed by the commander of Smyrna that "such an obligation was presented to the sentinel of the port, which he attributes to the indifference of the helmsman of the launch."

According to dispatches from Washington on Friday of last week, it has become known that some two months ago the President communicated unofficially to the diplomatic representatives of the United States in the belligerent countries of Europe his disapproval of attacks by bombs from aircraft dropped on unfortified cities occupied by noncombatants. Except that the President was careful not to take up the matter officially through the State Department, it is stated that nothing of a more definite character is known of the matter.

The situation in Egypt, so far as can be ascertained by dispatches, has not been seriously affected by the Sultan's declaration of a "holy war," or by the fulminations of the Khedive and his declared intention of assisting to lead the Ottoman army of invasion into the country of which he has been the nominal ruler. Meanwhile it has been reported, but not confirmed, that Great Britain contemplates appointing a new Khedive in the person of Hussein Kemal, son of Ismail Pasha, who was Khedive from 1865 to 1879, and uncle of the present Khedive.

If a dispatch published by the Paris *Temps* is correct, Belgium may not regret that she failed to take advantage of the opportunity to turn a dishonest penny by according the German host a welcome passage through her neutral territory. According to the *Temps*, Germany has paid to the Duchy of Luxemburg the princely sum of $37,500 as compensation for the violation of its neutrality. The amount of this damage has presumably been assessed by the German military commission which was recently appointed for the purpose.

Myron T. Herrick, United States Ambassador to France, who is retiring in favor of William Graves Sharp, and whose term had already been prolonged in consideration of the European situation, left Paris last Saturday. The retiring Ambassador and Mrs. Herrick were the recipients of many tokens of appreciation of the services they have performed since the outbreak of the war.

An interesting proposal for the creation of neutral zones in the Atlantic and Pacific Oceans is understood to have been made to Washington last week by representatives of various Latin-American countries, the object of the proposal being to safeguard the trade of Pan-American countries with one another. Owing to the difficulty of inducing all of the belligerent nations to agree to any such suggestion, it appears extremely improbable that the question will advance beyond the academic stage of discussion.

According to the report of Chandler Hale, of the American Embassy in London, who has investigated conditions at the detention camp for German prisoners on the Isle of Man, the recent riot there, which resulted in the deaths of five of the prisoners, was the fault not of the guards, but of the prisoners themselves. Mr. Hale found the detention camp well equipped in every way. His report will be forwarded to Berlin, where the incident occasioned much bitterness.

Subscriptions to the French loan have apparently come in at a rate that is regarded as eminently satisfactory, the aggregate subscribed, including the original Treasury notes put out, which were renewed on expiration, having amounted to more than 1,000,000,000 francs. The Paris correspondent of the New York *Times* declares that "as the Council of State had only authorized a total of 940,000,000 francs, application has been made to increase this total to 1,400,000,000 francs, for all indications point to this amount being easily reached within a week or two."

President Wilson on Sunday issued a statement dealing with the strike situation in Colorado, in which, in commenting on the continuance of the present state of affairs, he referred to the refusal of the mine owners to accept the plan of temporary settlement which he had already suggested, and which had been approved by the employees. The President declares, therefore, that he has decided "to appoint the commission contemplated in the plan of temporary settlement, notwithstanding the rejection of that plan by the mine operators." The commission is to consist of the Hon. Seth Low, of New York; Charles W. Mills, of Philadelphia, and Patrick Gilday, of Clearfield, Penn.

The New York, New Haven & Hartford Railroad Company gave notice on November 29 that on January 1 passenger rates would be raised on all its lines to two and one-half cents a mile.

The arbitration of the differences over wages and hours of employment of ninety-eight Western railways and their enginemen began in Chicago on Monday before a board of arbitrators appointed under the Newlands act.

The New York Stock Exchange was reopened on Saturday of last week for trading in bonds, after having been closed since July 30. Business since the reopening has been conducted quietly, and there has been no sign of the heavy liquidation which it was feared in some quarters might ensue. The Philadelphia Stock Exchange was reopened on Monday. There, too, trading was quiet and normal.

Dispatches from Athens have announced that a serious earthquake in which twenty-three persons were killed and others injured occurred on November 27 in western Greece and the Ionian Islands.

Conditions in Mexico can hardly be termed encouraging. President Wilson, in his weekly conference with the Washington correspondents on Tuesday, warned them that there were many persons in Mexico, as well as in the United States, who were interested in giving out false reports concerning the situation, with a view to stirring up trouble. That is doubtless the case, but the variety and conflicting nature of the reports that are published day by day would indicate rather that some ingenious person is interested in writing an extravaganza, with the distracted southern republic as its setting. The report, for instance, that Gonzales has set himself up as a third Provisional President may probably be regarded as the creation of some correspondent whose whimsical fancy has got the better of his veracity. Meanwhile, all that we can be certain of is that Carranza, who appears to have exhibited throughout an almost incredible combination of weakness and vanity, has retired in dudgeon to Vera Cruz, which he says is the temporary capital of Mexico, and from there amuses himself issuing directions to the United States to remove its warships from the adjacent waters. Villa, after being several times defeated in dispatches, and after a hairbreadth escape in a railway accident, finally entered Mexico City on Tuesday at the head of some 25,000 troops. There he issued a statement to the Associated Press, affirming the disinterestedness of his intentions and his entire devotion to the cause of Provisional President Gutierrez.

The deaths of the week include: Cardinal Aristide Cavallari, November 24; Dr. Clinton Wagner, Col. Robert B. Beath, November 25; Dr. James Truman, November 26; Philip Herbert Holt, November 27; Marchese Visconti-Venosta, November 28; Gen. Lewis Seasongood, November 29; Lucius Tuttle, John Gottlieb Wendel, Fanny Whiteside Brough, November 30; Rear-Admiral Alfred Thayer Mahan, December 1.

The Week

Whatever the outcome of the battles in Russian Poland, it is perfectly obvious that the German army must revise its judgment of the Russian troops, precisely as it has been compelled to admit that its low opinion of the British soldiers was erroneous. After the Austrian ultimatum to Servia had been sent, and it appeared as if Russia would come to Servia's rescue, the organ of the German General Staff, the *Militär Wochenblatt*, appeared with an article about the Russian army, so contemptuous in tone that it must have seemed to Petrograd a veritable *casus belli*. The *Wochenblatt* declared that the Russians had not recovered from the Japanese war; that the two new army corps supposed to have been formed since then did not exist save on paper; that the *morale* of the officers was very low, and that no Russian troops had ever defeated an equal number of any enemy in the history of the Empire. To the latter statement the German army may, perhaps, still cling, because the Russians have apparently everywhere outnumbered their enemy. But Field Marshal von Hindenburg himself—he seems a remarkably frank and generous soldier—admits freely that the Russians have made wonderful progress since their Manchurian campaign, and have fought with skill and daring. From our point of view, if the war should end to-day, the prestige of the German General Staff would be found to have suffered greatly. It miscalculated as to Belgium, as to the English, and as to Russia, to say nothing of the failure of its plan to rush Paris.

It is hard to part with a war-myth, but we are afraid that we shall have to give up those famous "concrete beds" which the Germans had prepared in England. The story of them is familiar. Here and there near London it had been discovered by various Sherlock Holmeses that an ostensible factory site, or even an innocent-appearing tennis-court, was in reality an emplacement for German howitzers, made ready in advance with secret and devilish ingenuity. So firmly convinced of this were many Englishmen that the War Office finally had the matter investigated. Major-Gen. O'Callaghan has reported on all the suspected places brought to public notice. He did, indeed, find some concrete floorings, but they were already giving way under the weight of mere machinery, without waiting for the heavy guns which they were to support. In a word, he completely disposes of the whole bugaboo. Moreover, Major-Gen. O'Callaghan pointed out that if the Germans had made in England concrete bases for their heaviest guns, they would have done a foolish because entirely unnecessary thing. There are no forts in England which it would need the 42-centimetre guns to demolish. If the Germans ever land an army on English shores, they will need to bring with them only their ordinary field guns, which stand on their own wheels. So if there are really any "concrete beds" in England, they must have been made by the Russian soldiers on their way from Aberdeen to Dover.

The loss of the battleship Bulwark may turn out to have been due to the Germans, but that is hardly likely to prove the case. For one thing, the instantaneous destruction of the ship, while the cruisers torpedoed went down comparatively slowly, makes against it; and then her anchorage at Sheerness was so protected that it seems incredible that a German submarine could have found her way into the fleet. The Audacious, too, was some time in sinking, and, if we may judge by the photographs, was without external above-surface injury. Even the Maine took some time to go down. The completeness of this disaster is truly overwhelming; it far surpasses the loss of the Maine, the Mikasa, and the Liberté. Were we not calloused by reading daily of thousands upon thousands of lives lost ashore, and the wiping out of the entire crews of such ships as the Good Hope and Monmouth, the whole world would be shocked by the character of the catastrophe. Whatever its cause, it is another blow to the battleship advocates, for it necessarily invites comparison between the financial and naval loss when a battleship disappears and when a submarine disappears—to say nothing of the lives lost. The total loss is now heavy in the British navy. In officers alone the fleet has lost about 280 killed since the war began.

Once more there are rumors afloat that France and Russia are seeking loans in Wall Street. They are to be small ones, easily subscribed for by two or three banks or trust companies, and, therefore, do not call for public offering. To make them the more attractive, large commissions are tendered, and in addition there is further bait in the promise that the money will be left on deposit here and be used solely for the purchase of war supplies in the American market. These small loans are, of course, merely to be entering wedges for the larger to follow. The fact that there is to be no public advertisement is counted on to relieve the operation from the criticism that this procedure is in violation of President Wilson's expression of policy, as given to J. P. Morgan & Co. in connection with a French loan at the beginning of the war. We trust that no bankers will be found to swallow the bait. For quite aside from the question of international morals and humanity, there are sound business and economic reasons to be advanced against this country's going into the business of financing either belligerent nation. First of all is the fact that we have been drawing on Europe for the last few years for the means to finance not only some of our railways, but also many new constructive enterprises. When the war is over, surplus European capital will for years to come be needed at home to make good the frightful waste of war, and we shall not have this resource from which to draw in connection, for instance, with the large capital needs of our railways during the next three years. Moreover, by dint of hard and able work by our bankers, the situation in respect to international exchange has been brought into better shape. To complicate its status now by large loans to European nations—and the large will inevitably follow the small if an entering wedge is driven—would be a grave mistake. This is the time for the United States to sit tight. We have suffered enough from the war without taking chances by weakening our home resources and becoming financially bound up with the fate of the warring nations.

There is one complaint, or appeal, that comes from all the countries involved in the war. It relates to the provision for the wives and children of soldiers. In Germany, as in England, this has been alleged to be far too meagre. Only this week we have the dispatch citing the Socialist organ, *Vorwärts*, which reproaches the Government for not having done more to care for the real heroes and martyrs of the war. Similar protests have been made by newspapers and writers speaking for the British Labor party. No doubt, the authorities in all the warring nations have made great efforts to avert misery among the women and children left behind, and among men thrown out of work. More will doubtless be done, as the war goes on. In all this government activity in behalf of the needy and unemployed, certain Socialists are seeing an adoption of their own position. What is now done temporarily, in a terrible emergency, will hereafter be done regularly, on a great scale, and as a

part of the recognized obligation of governments. Relief will continue to be organized; money from the public funds given to those who cannot support themselves; and the finding of employment, or "making work," reckoned among the duties of responsible officials. This is surely too hasty a jump to conclusions. It may rightly be hoped, however, that the knowledge and experience gained in this whole class of problems, under the stress of war, may not cease to be of avail after peace has come. Miss Tarbell makes the point forcibly, in her article in the *American Magazine*, that the great lesson to be learned by the United States from the European struggle is, not to prepare for war, but to organize for peace, and to do it by grappling more resolutely than we have done with the tough problems of industrialism and of poverty.

The Dutch Government's declination of aid from other nations in caring for the Belgian refugees in Holland ought to serve as a reminder of the nature of the obligation which the people of countries free from the affliction of war should cheerfully assume. While many have given generously in this country for the suffering Belgians, it is a mistake to regard the amount thus far contributed as coming anywhere near the amount which so extraordinary an emergency calls for. Indeed, there has been a marked scarcity of those large individual contributions which, in a country with so many multi-millionaires, ought to be a matter of course; there has been no contribution above $10,000, only two, we believe, of that amount, and very few have exceeded $1,000. It is gratifying to see that the contributions of more modest sums continue to flow in at a steady rate, but it cannot be too plainly said that the five or six hundred thousand dollars thus far received by the Belgian Relief Committee is but a small fraction of what we ought to send.

In reading of the tributes of appreciation paid to Ambassador Herrick on his departure from Paris, one cannot but feel how regrettable it is that our practice in relation to the diplomatic service should make it a matter of course that such a man should be displaced solely for the reason that a new political party, or a new national Administration, has come into power. During nearly half of President Wilson's term, Mr. Herrick has held over; now his place is to be taken by a man without any diplomatic experience, and with no special qualification for the post so far as the country knows. It is true that in many instances the new man does surprisingly well; there is no question of the remarkable adaptability which the typical American shows in all kinds of unexpected situations. But the opposite kind of showing is by no means unknown in the service; and indeed, unless every maxim of human experience is foolishness, it is plain that the Government, like any other institution, must in general be the loser if it removes tried and successful men who have served it in difficult tasks, for no better reason than the desire to give the "job" to some other person.

The decision last Monday of the Supreme Court, on the Oklahoma "Jim Crow" law, is but one of several that will soon have to be made in cases of like kind pending before it. They all involve the Constitutional rights of negroes. While the Court held itself in this instance, as all courts will, to the strict legal procedure, and so dismissed as faulty the petition to enjoin the Oklahoma railways from enforcing the State law, this dismissal was not simply without prejudice, but was accompanied by an opinion on the ultimate main question which is of good augury for the future. The majority decision, as given by Justice Hughes, laid down positions which are wholly inconsistent with attempts of any kind to write race discriminations into law. "The essence of the Constitutional right," said the Supreme Court, referring to the right to equality of treatment, "is that it is a personal one." It has nothing to do with the numbers or color of persons affected. "Substantial equality of treatment of persons travelling under like conditions" is what common carriers are bound to furnish, declares the Court, and, if they do not, the aggrieved traveller "may properly complain that his substantial privileges have been invaded." This doctrine is as cheering as it is sound; and it leaves no doubt that, in the end, the Supreme Court will not consent to the setting up in this country, and under our Constitution, of a "Jim Crow" government.

In announcing that he has appointed a commission of three, as contemplated in the tentative plan for the settlement of the Colorado mine troubles, in spite of the rejection of that plan by the operators, President Wilson uses language that seems carefully calculated to prevent this move in the interest of conciliation from being itself made the occasion of fresh controversy. It does not appear that he asks either mine-owners or mine-workers to accept the Commission as having any specific powers. His object in appointing it is "to create the instrumentality by which like troubles and disputes may be amicably and honorably settled in the near future"; and it is solely upon the good will of the parties, and their sense of public duty, that he counts for the calling in of the commission to investigate and settle disputes which stand in need of such interposition. The personnel of the Commission is such as to give good ground for this expectation. The men representing respectively the operators' and the miners' point of view have had much experience in just such work as would fall to them in Colorado; and to represent the standpoint of the community at large, both with broadmindedness and with seasoned ability, Mr. Wilson could not have chosen a better man than Seth Low. The consent of these gentlemen to undertake the task is fitly made the subject of warm commendation by the President.

The minimum-wage question is not, just at this moment, being very much agitated. How complex it is, we took occasion to point out at the time when proposals for a minimum wage for women were sensationally thrust forward under the influence of sex-hysteria. A cardinal element in the case, though it seemed to be completely ignored by the agitators, and received scant consideration from anybody, is the relation between the rate of wages and demand for labor. This must, of course, be a potent, though perhaps unnoticed, factor at all times; but at a time like this, when unemployment is widespread, it should not fail to obtain attention. In the Chicago *Herald* we find a pathetic account of the scenes at the opening of the emergency employment centre of the Woman's Club of that city. "The aim of the women inside and those in the hall," we are told, "was the same—to get a job, a thing that meant the difference between hunger and food, want and comfort. There were not jobs enough to go round." Mrs. Benjamin Carpenter, one of the directors, said:

> There is something tragic in the thought of these disappointed, hopeless women. We need more offers from employers of women. We need more jobs to give.
>
> If employers would come to us for help, if they would come selfishly, if they would come out of sympathy for these girls and women, if they would come on any grounds at all, a great problem would be solved.

Is it not obvious that a minimum-wage law—certainly the kind of minimum-wage law chiefly advocated at the time we have referred to, a law establishing a fixed minimum of eight or ten dollars a week—must vastly in-

crease the extent of this kind of unemployment?

Not much is heard nowadays of that parallel between the new-born Progressive party and the Republican party in its early days, which, two years ago, the Progressive leaders never tired of proclaiming. Indeed, the only reference to it we remember to have seen since the election is the unfortunate one made by the Acting Chairman of the party organization in Massachusetts, who, writing—it must have been in his sleep—to the Progressive brethren, gave them the astonishing information that "in 1858 the Republican party, after showing marvellous strength in its first Presidential election, two years previously, apparently disappeared, and the Whigs came back"; whereas in reality the Republicans in 1858 became for the first time the dominant party in the House of Representatives, while the Whig party "stayed dead." However, the contrast in point of electoral success is not the only one that stares us in the face. If, after the elections of 1858, Lincoln had declared that he was "the privatest of private citizens," if Seward had announced that "the irrepressible conflict" was all a mistake, and if Chase and Giddings and the rest were considering whether on the whole it might not be just as well to get on with what the Whigs or the Democrats might do for Republican principles, we should have something like the condition that the Progressive party now finds itself in.

Reports of a falling out between Gov. Johnson and Francis J. Heney come just in time to give piquancy to the Progressive autopsy at Chicago. Heney does not understand why he ran so poorly in San Francisco in his race for the Senatorship, while doing so well in the rest of the State. Phelan, his Democratic opponent, was supposed to be weak with the labor unions, because of his having put police on the wagons in a teamsters' strike fifteen years ago. Johnson, on the other hand, is allied with the unions. Yet Phelan had a plurality of 60,000 in San Francisco, which was reduced to 25,000 by the returns from outside that city. Heney is said to be on the track of a deal between Johnson and Phelan, having relation to Johnson's Senatorial ambitions, and to have decided to make trouble by bringing charges of graft in the Progressive stronghold, Oakland. All this is sad reading, coming from the only State where the Progressives are still marching on. Too many leaders, it is evident, spoil harmony, particularly when they are not content with moral victories.

Interesting evidence of the essential homogeneity of our country is furnished by the way in which the recent radical advance in standards of medical education is appreciated in the South. The New Orleans *Times-Picayune*, dwelling on the statistics adduced by Dr. McGuire, in his recent presidential address to the Southern Medical Association, approves his position in regard to their significance and the policy that lies behind them. The reduction that has taken place in the number of medical schools and of physicians, says the New Orleans paper, "does not mean that there has been any reduction in the number of competent physicians, that there are not enough to attend to all our ills, but simply that the standard has been raised, and that fewer young men are being turned loose on the public each year, after a few months of lectures, to hang out their signs as 'M.D.,' and afterward learn the trade by experimenting surgically or medically on those who are so unfortunate as to fall into their hands." And so far from being frightened by the drawbacks which attend this process of improvement, it urges that State Legislatures should adopt a policy of strict examination into the standards not only of medical, but of other professional schools.

Does anything take longer in this country than to find out who was elected to an office, if either candidate disputes the returns? Last year, a Dr. Bacon was declared elected to the Philadelphia Select Council. His opponent, a Dr. Moore, demanded a recount. He got it—six months later. One month afterward, the examiner in charge of the case reported in favor of Moore. After another month, the Court of Common Pleas affirmed the report. Bacon then appealed to the Supreme Court of the State. This was five months ago, and the decision is yet to be rendered. The candidate whose claim to the seat has been declared by two separate authorities to be null holds it, voting upon measures relating to the interests of the ward he may in the end be found not to be representing. But what difference does it make which of two respectable citizens speaks and votes in a city council? Well, in this case, the candidate in possession of the seat is an organization Republican, while his opponent is a reform Republican.

The "dead hand of literature" has long weighed heavily on living authors. What chance has Gifted Hopkins against Shakespeare, when the latter can be endlessly reprinted without royalties? The plaint is an old one; but it is varied by a Western college professor. He protests that the dead hand of the past is strangling the teaching of literature. The prescribed reading is almost wholly confined to dead masters. Pupils receive nothing fresher to read in the way of novels than Thackeray or Hawthorne. But how can literary education be brought strictly up to date unless its material is just off the presses? The thing to do, urges this logical instructor in literature, this educational Lochinvar, is to set the boys and girls courses in O. Henry, instead of George Eliot, and to displace Dumas with Oppenheim. Only so can the students be made to feel that they are living, that they are moving, in a grand and awful time, and that books are really a part of the breezy present. We should say that if any teachers find the breezy present neglected by their young readers, who spend all their spare time on forgotten sages and out-of-date poets and romancers who never dreamed of an aeroplane, this would be a good way to make them rub their eyes and wake up and realize in what century they are living.

"Canada," said the Hon. Robert Rogers recently, "is going to do her share in feeding the Empire." The Government's announcement that the acreage to be given to wheat in Manitoba, Alberta, and Saskatchewan is 45 per cent. more than that of this year bears him out. Such figures must be based partly on autumn preparations for spring planting; but there is no reason to believe them greatly exaggerated. In 1913 the three Provinces named planted over 10,000,000 acres—nine-tenths of Canada's whole acreage, and about one-fifth of the American total. An increase bringing this up to about 15,000,000 acres, and the output in bushels to over 315,000,000, would be amazing in its suddenness. The Government, however, has made strenuous efforts to induce the settlers to enlarge their farms, and, with the railways, is even now distributing millions of bushels of seed; the current of immigration has been fairly steady; and the price of grain is now an extraordinary incitement. These official estimates already show that the reports of depression in Saskatchewan following this season's drought and storms were unfounded. In some sections the distress bade fair to be severe, but the Province's action in providing $1,000,000 for public work on the roads relieved it, and has apparently encouraged newcomers without resources.

THE "PREPAREDNESS" FLURRY.

That President Wilson intends to keep his head in the present flurry over our "preparedness" for war is gratifyingly apparent in the news from Washington. It has been quite evident that the present conflagration in Europe is to be made the excuse for a wild raid on Congress for more soldiers, more sailors, and more ships. Witnessing the total breakdown of the militarist pretension abroad, that large armaments insure peace, we hear from our Navy League, our alarmed Gardners, our gun and armor makers, our Roosevelts, and our jingo generals, that we, too, must imitate the folly of Europe, even though it is now drenching its soil with blood. At the very moment when the "most senseless of wars" is endangering civilization itself, we are told that the United States must check its internal development, rob industry of hundreds of thousands of workers, and pour forth treasure by the hundred millions—just as if everybody could not now see that the European armaments were certain to have brought on a conflict, had there been no other cause.

That some of the people behind this movement are sincere, if too badly frightened to think straight, appears from the list of New Yorkers who have recently joined together to demand an inquiry as to our preparedness for war—to see if we are really "safe." No such inquiry as they and Congressman Gardner seek is necessary. The facts as to our preparedness for war are easily ascertainable. They are contained in the reports of our Secretaries of War and Navy, our Presidents' messages for years past. They can be obtained from those officials at any time. The Navy League is so sure that it has them all that it knows just what to advise, both as to army and navy. Every military attaché in Washington has the whole story at his disposal. Information is not the object of Congressman Gardner, however it may be with the New Yorkers who are suddenly desirous of having more light on our situation. He wants to have army and navy officers appear before committees of Congress to give testimony as to what they think ought to be done, which is like asking protected manufacturers battening on the Treasury to write their own tariff schedules. If this prevails, we shall be in for an inquiry of the utmost sensationalism, at which our generals will dispute whether we shall have 205,000 or 500,000 regulars, and our admirals whether we shall have fifty battleships or two hundred and fifty submarines.

Fortunately for the country, the President is not to be stampeded. With courage and far-sighted statesmanship he lets it be known that he should regard any such inquiry as ill-timed. He does not put it on the ground of keeping your head when your neighbors are shooting one another. He puts it on the far nobler ground that before this country lies the greatest opportunity that has ever come to it, or perhaps to any country—the opportunity of playing the leading part in bringing the war to a close. Never before did a greater possibility of usefulness open before an American statesman than that which looms before Woodrow Wilson. That he is of stature to seize the opportunity when it presents itself, this stand he is taking clearly proves. For he sees how ineffective—how hypocritical—would be our appeal for peace, our offer of good services, our pointing the way to disarmament, if we were to make that appeal fresh from new concessions to the armament ring, fresh from voting more hundreds of millions out of the pockets of the people and into those of ship-contractors and manufacturers of supplies.

To approach the European combatants thus with new weapons in our own hands, would be to fling away our moral position. Never has the United States stood higher morally in the world than to-day; this is attested by the way our good opinion is sought by both sets of allies. If it is to live up to the greatness of the hour, it must go to the warriors not with the news of a slavish imitation of the wicked policies which have driven some to the verge of moral and material ruin and others beyond it, but with a readiness to lead in the other direction. The menacing growth of our navy has been cited both in the Reichstag and in Parliament as one excuse for piling more burdens upon German and British taxpayers, by building more and more battleships. To our mind this is not only not the time to inquire about our preparedness for war, it is the time to refuse to vote a single additional ship, and to lead the world towards disarmament by beginning to disarm ourselves. The high example to be set by such an action would make a strong appeal to the victims of the war—certainly to enlightened consciences in every quarter of the globe.

Surely, it is a cause for the utmost thanksgiving that the occupant of the White House sees and senses this, and is ready to bear if need be the criticisms of little minds who can see nothing more in all this horrible suffering and carnage, this breakdown of Christianity, than the need of preparation for slaughter. We are convinced that the President has only to state the case for the people to rise to him as they have risen whenever he has made a plea for justice and humanity. The American people are thinking about what all this means. Hundreds of thousands have fled to this country to escape the burdens of militarism; they have no desire to shoulder new ones here. There are plenty of men in public life, too, who will rally to the President's support. There is Congressman Walter L. Hensley, of Missouri, for instance, a member of the House Committee on Naval Affairs, who is openly stating his belief that this is no time for an inquiry; that the lesson of the European struggle for us is that we should refrain from building more battleships and weapons of destruction. But it is the hour for all who feel thus to make themselves heard.

WHAT NEUTRALS CAN AND CANNOT DO.

It has been customary to speak of nations that are neutral in the present war as singularly fortunate. Such, of course, they are in a very true sense. But to picture their lot as if they were nothing but a *tertium gaudens*, wholly detached, with no vital interest of their own involved, no dangers to guard against, and no duties scrupulously to undertake, would be a mistake both obvious and ludicrous. Holland and Switzerland are neutral, but to what expense has each been put! What anxieties have robbed their rulers of sleep! Even upon the United States, sundered by the sea from the scene of hostilities, the war has laid heavy burdens. For weeks the strain upon the neutral Government at Washington was almost too great to be borne. We need not again enumerate the emergencies which successively confronted the President. Some of them have been continuing in their nature. Financial crises could be surmounted, relief for Americans caught abroad could be organized, impaired public revenues could be made good; but the work of maintaining neutrality and living up to all its obligations, while being vigilant to assert every neutral right, has been incessant and exacting.

Not the least of President Wilson's troubles during the war has been to resist impossible demands. From foreign nations and by some of his fellow-countrymen, he has been called upon to do what could not properly be asked of him. Certain impulsive people seemed to think that somehow he could stop the war! At least, he could "protest" at everything they did not like. It has been gravely argued that he should have called Germany to book for violating the neutrality

of Belgium—though to what book, was not specified. And various excited citizens have been heard to declare it to be the President's duty to say in a loud American voice that "atrocities" must cease, and that if there was another instance of bomb-dropping, as upon Antwerp, the American navy would be ordered to do something or other, just what never clearly appeared.

Many things less absurd have been urged upon Mr. Wilson; but about them all he has refused to speak. From this it did not follow that he had given up thinking about all the phases of American neutrality, or about what he might be able to do to mitigate the ferocities of warfare, while waiting the fit hour for the proffer of good offices in bringing about peace. And that he has not been so inert as has been asserted in some quarters appears from the news that our Ambassadors have in some of these matters addressed inquiries to the Governments of the belligerent nations. There has been no fine flourish about it; nothing approximating a formal or threatening protest. In this way at least the President has indicated that he should regret to see any violation of the established rules of war. One of those involved relates to the security of non-combatants, and requires that they be notified before the bombardment is begun of any place which they may be occupying. This does not, in set terms, forbid the dropping of bombs upon the houses of a city, but in effect it does. Nor is this based upon any Hague agreement, partially ratified, but upon a principle of international law long recognized. To have called to it the attention of warring nations was not an unneutral act. And that the President's activity along this line has borne fruit, there seems to be evidence in the distinct lessening of the reports of this form of warfare. It is a long time since any German aviator has dropped bombs in Paris. From English aeroplanes explosives were dropped into a Belgian town a short time ago, killing a few civilians, so it was reported, but the explanation would doubtless have been that the aim was to destroy a railway station or trains which the Germans were using. Whether the slackening we note is only temporary, or not, whether the long-heralded raid of the Zeppelins on London will be made or not, we have no means of knowing. All that we at present remark is that President Wilson did take a quiet but effective step to bring about new respect for an old rule of war. And he did it wholly within his obligations as the head of a neutral Power.

To judge by dispatches from Washington and from some parts of South America, a more ambitious project, with the aim of extending the bounds of neutrality, is afoot. This is nothing less than an attempt to draw the United States and all of Central and South America completely out of the range of hostilities. The proposals, as thus far outlined, seem rather vague. The idea is to prevent our commercial ships from being interfered with by the warships of a belligerent. And there is also said to be hope that an agreement may be come to by which no naval battles will be fought in American waters. This is not, of course, a question of the three-mile limit, but of the high seas off American coasts. The mere statement of all this is, of course, enough to show that it is extra-legal. But that something of the kind is being seriously considered, appears to be beyond doubt. The South American Governments seem to be actively interested in it. Should the result aimed at be obtained even but partially, it would show statesmanship taking occasion by the hand to make the bounds of neutrality wider yet.

UNIVERSITIES AND THEIR MONEY'S WORTH.

Nothing could be more vigorous, or more broad-minded, than President Butler's verdict, in his annual report, on the foolish and wrong-headed proposal of applying to the teaching body of a university the mechanical tests of the efficiency engineer. Strangely out of keeping with the spirit of that utterance is the following passage, elsewhere in the report:

> The University is expending each year out of the income of its endowment immense sums to supplement the fees paid for tuition, in order to provide the best possible facilities for college and university instruction. The University owes it to the public and to itself to see to it that these colossal expenditures are made only upon and in the interest of those who are really fit physically as well as mentally to take advantage of the opportunities which the University has to offer, and to make appropriate return to the community in the form of personal and social service. There is a careful physical examination insisted upon in the case of candidates for admission to the military and naval academies maintained by the Government of the United States. . . . It is a matter well worthy of earnest consideration whether Columbia University should not once more take the lead in formulating educational policy, and provide specifically that physical fitness as well as intellectual capacity shall hereafter be required of all candidates for admission to the University in any of its parts.

Of course, President Butler cannot mean that the physical test he recommends should be as severe as that employed at West Point or Annapolis; but evidently he has in mind a fairly exacting test. It is true that he mentions the fact that "in Columbia College a certificate of good health is now required for each candidate for admission, but no similar provision is made elsewhere in the University"; but he opens the whole discussion with the statement that "there is one particular [viz., physical fitness] in which the examination of candidates for admission is not sufficiently searching." Taken altogether, it is plain that what Dr. Butler contemplates is something more than the ordinary "certificate of good health."

This proposal of a physical test as a condition for the enjoyment of university opportunities has evoked a number of protests in the newspaper press. It has been pointed out not only that a poor physique may be no insuperable obstacle—often no obstacle at all, sometimes even a stimulus—to intellectual success, but also that some of the greatest and most fruitful minds the world has ever known have been housed in very imperfect bodies. But President Butler's proposal is open to an objection far deeper and broader than this. It is true that the student of a university receives benefits the cost of which his tuition-fees are insufficient to cover; but to press this point home, in such a way as to cause the student to regard himself either as an object of charity or as the recipient of an advance which he is in honor bound to repay in any definite way, would be fatal to the spirit of university life. We must take a broad view of the way in which university education conduces to those great ends which the resources devoted to it are intended to compass. Those resources should not, indeed, be wasted upon young men who do not avail themselves of the opportunities furnished for the acquisition of knowledge, for the improvement of mental powers, for the advancement in culture; but to insist upon a return, in each individual case, in the shape of "personal or social service" is to make impossible a free and generous intellectual atmosphere. Let our universities welcome every young man who is attracted to them by the love of learning, and we can well afford to take chances as to just what percentage of them will make a return for the cost in the shape of specific "personal or social service." If we take the broadest view, to be sure, the question lapses; for simply to *be* a man of high intellectual quality, of serious intellectual interests, is, we take it, a "personal" service of high import; but, waiving this,

we may be sure that the harvest of "service" of a more material kind will be greater if we let the free air of a generous intellectualism play about the crop than if we attempt to enclose it within the barriers of a narrow and calculating utilitarianism.

Neither the analogy of West Point and Annapolis, nor the analogy of the undergraduate college, helps to bear out Dr. Butler's view. At the army and navy training schools the end in view is the single and specific object of turning out a body of men fitted to take charge of the operations necessary for the national defence, and to take command of the forces of the country, on land and sea, in time of war. For this purpose, physical fitness is as essential as mental competency; and no incidental benefits that might come from the training can possibly be permitted to count as a substitute for these imperative needs. As for the certificates of good health required of college students, these, so far as we know, are imposed, not for fear that a few dollars of the institution's income may be wasted upon here and there a delicate youth, but for fear that the boy himself shall suffer injury, or fail to get benefit, from an undertaking beyond his strength. The question of a young fellow being in danger of a breakdown often comes up in the meeting of college boards; but we have yet to hear of an instance in which it has been considered from the financial, and not from the human, standpoint.

In the course of his remarks on the question of efficiency in the professorial body, President Butler said: "A university is precluded from being efficient in the mechanical or business sense by its essential character and by its necessary policies." Most true—and applicable just as truly to the spirit in which the university should regard its body of students as to that in which it should view questions of faculty organization. In the one case as in the other any specific gains that might be obtained by keeping close tab on the concrete results in the case of each individual would be far more than counterbalanced by the general loss in tone, which would affect the whole body. In both cases alike the proposed innovation is a manifestation of a certain misdirected striving for perfection which is very much in the air nowadays; a thing that should be called an itch for perfection rather than a striving for it. In short, in both cases, we would kill the goose that lays the golden eggs—that classic symbol of "efficiency" overreaching itself.

Chronicle of the War

The slackening of the German attack on the western line, which we noted last week, has continued until it may be said to have ceased altogether. Even the force of the artillery fire has diminished considerably during the past ten days. There have been the usual and obvious reports that this does but mark the lull before the storm, and that the Germans are massing their forces preparatory to launching another desperate attack in the direction of Arras or of Ypres. It implies no undue disparagement of the German fighting force if we discredit these reports. The frequent statements that the German regiments, many of them, consist now mainly of old men and boys have been sufficiently disproved by the fighting quality which these regiments have displayed. As further warning against undue optimism in Allied quarters on this score, we may call attention to two private letters which appeared recently in the London *Times*, one from a major in a Highland regiment, the other from a general officer commanding a brigade, both protesting against the misinformation concerning the quality of the German troops published by the English papers and paying high tribute to their courage and efficiency.

It is not necessary, however, to assume that German resources in men are strained to the severest pitch to doubt their resumption of a serious offensive at this time. There are many indications that, so far as the German offensive is concerned, the long-drawn-out struggle on the Aisne and in Flanders is drawing to a close, may, indeed, already be said to be ended. Of this, the report of Sir John French, which was given out by the Official Press Bureau on Sunday, and which covers the operations in Flanders, approximately from October 11 to November 20, furnishes the strongest evidence. "As I close this dispatch," declares the Field Marshal, "signs are in evidence that we are possibly in the last stages of the battle from Ypres to Armentières. For several days past the artillery fire of the enemy has slackened considerably, and his infantry attacks have practically ceased." We saw last week how the operations in the eastern area of warfare have reacted upon those in the west. It is unquestionable that considerable numbers of troops have been withdrawn from France to reinforce Gen. von Hindenburg's army in Poland, and in view of the course which the fighting there has taken, it is probable that the drain on the forces in the west may continue. Sir John French's dispatch brings out clearly how violent and powerful were the German attacks on the line Nieuport-Ypres-Armentières after the fall of Antwerp and when the German armies were reinforced by the troops that had been engaged in the siege of that city. Yet these attacks failed, though only by a narrow margin. Later, in the second week of November, there was the desperate attack of the Prussian Guard, the fine flower of the German army. That, too, was repulsed with enormous casualties.

If, then, these two offensive movements, the one strongly reinforced by a fresh army, the other initiated by troops especially picked for the purpose, were unable to accomplish their object, not the most hopeful member of the German General Staff, one would suppose, can look for success from a new offensive undertaken under conditions far less favorable than attended the former attempts. Not only is the German army in the west weakened by drafts sent eastward and by casualties (and these Sir John French estimates with confidence as having been in the proportion of not less than three to one to those of the Allies), but it has opposed to it, not this time Belgian troops in the last stages of exhaustion and a British force, as Sir John French points out, greatly over-extended over a long line, but an army that has had time to recuperate and has been considerably reinforced. As we write, there are reports of a renewal of fierce fighting at Ypres, but, though this should prove to be of some magnitude, it will almost certainly be found that the German attack is in the nature of a counter-offensive, undertaken solely for defensive purposes. It is even conceivable that it might be the preliminary to a general retirement.

Writing last week, we pointed out that present circumstances would appear to be favorable for an assumption of the offensive on the part of the Allies, and suggested that lack of equipment rather than lack of men might explain Gen. Joffre's delay in taking the initiative. There have been since we wrote certain faint indications, each slight in itself, but in sum presenting an argument that is at least worth taking note of, that the offensive movement of the Allies may not now be long delayed. In the first place, there is the confident tone of Sir John French's dispatch, seeming to confirm the sanguine note that is sounded by the French military experts. Secondly, there is the significant news that came on Saturday of last week through the correspondence of the Associated Press, dated from Havre on November 19, that ever since Lord Kitchener's speech at the Lord Mayor's banquet, on November 9, there has been a steady stream of transports from England to Havre. The fact of the arrival of considerable British reinforcements is confirmed in Sir John French's dispatch, where he speaks of nine Territorial regiments which have taken part in the recent fighting. That was up to November 20. The reinforcements to which the Associated Press alludes cannot, of course, consist of Lord Kitchener's new army of more than a million men, for these have not as yet received the training to fit them to take their place in the line of battle; but if nine Territorial regiments have already acquitted themselves well in the fighting, there seems no reason why others should not prove equally efficient. Add to this Sir John French's statement that the improved military situation has lately allowed of large numbers being withdrawn from the fighting line to rest and refit, and it seems safe to assume that Territorial reinforcements in very considerable numbers have arrived at the front.

Definite news from Poland, where for two weeks a fierce battle has been raging, is still lacking. The unofficial accounts, which we noted with reserve last week, giving news of an overwhelming Russian victory, were never supported by the official bulletins, and, as events have turned out, were premature. It is still extremely difficult to give even an approximately accurate account of the progress of the battle around Lodz, and quite impossible to hazard any prophecy as to its ultimate outcome. There seems to be no

doubt, however, not only that the German offensive into Poland received a very severe check, but that part of the German army was at one time in considerable danger of annihilation. That was after the battle which we recorded last week on the line Strykow-Zgierz-Zdunskawola. Unofficial reports declared that the right wing of the Germans was here virtually surrounded, and another Sedan was confidently expected. Something very like this appears to have been narrowly averted, although the official statements from Petrograd uttered repeated warnings against the acceptance of unofficial rumors of crushing victories. Sedans, though, as we saw in the west in the earlier stages of the war, are unlikely to happen under modern conditions of fighting. Apparently, the German right wing was all but enveloped, but the Russian forces were not sufficiently overwhelming in number to complete or to hold the circle, and the Germans by heroic exertions succeeded in cutting their way out.

To speak, therefore, of the German line as having been cut in two places, and the right, centre, and left of the army separated from one another, is no doubt an exaggeration. German losses, if we are to accept any part of the unofficial reports as true, must have been enormous, but the line, though a tortuous one, still holds. On the north the Russians have apparently penetrated as far as Plock, on the Vistula, which marks a notable advance of their right wing. From this point the line may be traced southeast to Gombin (occupied by the Russians last week) and to Lowicz, on the Bzura River. There it turns to the west, forming an acute angle, and follows the Bzura to Sobota, where the Mroga River flows into the Bzura. Turning south again at this point, it follows the Mroga through Bielawy to Glovno, and continues thence through the Strykow-Zdunskawola line to the River Warthe. Though the Russian successes have not proved to be of the overwhelming character which reports from Petrograd would have had us believe, the positions indicated are sufficient to show the definite nature of the check which the Germans have received in their second advance into Poland.

It is, however, more important still to note that the Russians have checked this advance without, as was the case in the former advance on Warsaw, withdrawing troops from their right and left. On the previous occasion the incursion into Poland immediately relieved the pressure on the Austrians in Galicia. The present advance was undoubtedly undertaken with the same motive and with the additional, and in German eyes doubtless far more important, purpose of staying the Russian aggression into East Prussia. In both respects it has failed. The Russian centre has held without drawing in its wings. In East Prussia the significant admission is made by the Berlin War Office that Russian forces have penetrated to the neighborhood of Darkehmen, which is some thirty-five miles west of the frontier, on the river Angerap, southwest of Gumbinnen. Here, then, the Russians are across the German strategic railway which skirts the frontier between Stallupönen and Goldap, and are threatening Insterburg. Similarly in Galicia their advance has not been halted, as on the previous occasion, by the events in Poland, and they are now within striking distance of Cracow.

Foreign Correspondence

PARLIAMENT AT WORK AGAIN—NEWS FROM THE FRONT—KHAKI THE ONLY WEAR — CAPTAIN VON MUELLER—LORD ROBERTS.

By SIR HENRY LUCY.

WESTMINSTER, November 13.

The meeting of Parliament for what will prove its last session was marked afresh by that unity of feeling and devotion to a common cause instantly established when the country found itself at war with a foreign foe. We have lived to see the realization of the poet's dream of a condition of things when none are for a party, but all are for the State. Parliament has been summoned at this abnormal date for the specific purpose of providing further money for prosecution of the war. This done—and it will be accomplished next week practically without debate, certainly without division—further adjournment into the new year will take place. On this side of Christmas no attempt will be made to proceed with legislation.

For the first time within the memory of living man, a new session of Parliament has been started without festive preliminaries. On the night before the opening ceremony is achieved the Prime Minister is accustomed to entertain his colleagues at dinner in Downing Street, the leader of the House of Lords playing the part of host to the titled members of the Government. The leaders of the Opposition in both houses provide the same pleasing reception for ex-Ministers. It is an old-fashioned courtesy, still happily extant, that they are provided with a copy of the speech to be delivered from the throne on the following day. It is read aloud to the company about the same time that its secrets are disclosed elsewhere by the Premier and the leader of the House of Lords.

Up to the accession of Edward VII a full summary of the document was supplied to editors of the principal daily papers. Its information was available for use in their leading columns. But it was a point of honor to maintain throughout the article a tone of ambiguity. It would have been something approaching *lèse majesté* to anticipate the utterance of the sovereign. Accordingly, able editors gravely ambled round the text of the speech, introducing successive announcements in such phrases as: "It is probable that the gracious speech may announce—" or, "We should not be surprised if his Majesty were to declare intention on the part of his Government to—" On coming to the throne, King Edward made an end of the solemn, not to say priggish, farce. The proposals set forth in the speech from the throne are not now communicated to the editors, who nevertheless by effort of intelligent anticipation generally get pretty near the facts.

This week there have been no Ministerial or ex-Ministerial dinners. More important still to a wide political circle, there have been no evening parties at headquarters in either camp. It has been usual at Downing Street for the Prime Minister's wife to be "at home" to supporters in both houses, their wives and daughters. The brilliancy of the Assembly is added to by the appearance on the scene of foreign Ministers, wearing all their stars and ribbons. Interest of another kind is added by the presence of well-known men of science, of literature, of art, of music, and the stage. Had Mrs. Asquith given her usual party on Tuesday evening there would have been what is known in the money market as "a shortage" of Ambassadors. The German Minister departed three months ago, followed reluctantly by Count Mensdorff, who for many years represented the Austrian Emperor at the Court of St. James's, acquiring the position of one of the most popular members of London society. Now the poor Turk has trundled off—in tears, it is said, emotion partly due to regret at leaving London, and partly to certain prevision of what will follow to his helpless country as a penalty for permitting itself to be dragged at the chariot-wheels of the Kaiser.

Since the war commenced a striking change has been made in the neighborhood of Buckingham Palace and Marlborough House. Formerly sentries, drawn from the regiments of the Guards, wore the red tunic, the striped black trousers, and the gigantic busby. Today they pace up and down in khaki, with knapsacks on their backs, water-bottles at their sides, ready for active service, however sudden the call. Khaki is indeed the only wear for soldiers. His Majesty has added a suit to his abundant wardrobe and wears it occasionally when he visits newly recruited forces. On Wednesday, as the King drove down to Westminster to open Parliament, he passed between rows of detachments from crack regiments of the regular army all in khaki. The only exception was the staff and escort accompanying the royal carriages, who wore the review order uniform. The troops from overseas, who, marching in the Lord Mayor's procession on Monday, met with a remarkable ovation, were, of course, all clad in unobtrusive khaki. The adoption of this fashion, of comparatively recent date, is a distinct advantage to the service, showing off the manly athletic form for centuries obscured by the medley of gaudy colored uniforms.

At the Lord Mayor's banquet a significant indication of popular feeling lurked among the commonplaces of the wine list. No German wine was served, an exclusion that will doubtless lead the way at public banquets elsewhere and hereafter. This will be an added blow to innocent wine merchants already suffering from a marked falling off of trade. It is becoming the fashion at clubs and at many private houses to abstain from champagne at dinner. It is justly thought that this is not a time to grow merry at an extravagant price per head. Incidentally, the war has proved a powerful incentive to temperance. At home, as in France, public houses, restaurants, and the bars of hotels and clubs are closed at an hour so early that had it been decreed six months ago there would have been a riot in the streets. In Russia, the Czar, at enormous cost of revenue, has at a stroke prohibited the sale of vodka, resulting in a social revolution, second only, in a sense parallel with, the emancipation of the serfs. In Paris the Government, having closed the cafés after an early dinner hour, has prohibited the sale of absinthe, thus eliminating from the time of day what to the boulevardier was its happiest stroke—*l'heure d'absinthe*.

Up to this year the month of October marked a distinct and pleasant departure in social life in London. It has a season all of its own. Folk returning after holiday-making at home or abroad, delighted to meet old friends

after three months separation, got up little dinners, not so big nor so elaborate as those which crowd the regular season, but none the less pleasant. Nothing of the kind has marked the course of this late autumn. People instinctively refrain from holding festivals of any kind. With millions of men fighting day and night in the once fair fields and prosperous towns of butchered Belgium, it seems better to dine quietly at home, haply setting aside out of reduced household expenditures something additional in the way of relief for the victims of the war. Most of the big London restaurants, whose crowded glittering conviviality at the dinner or supper hours was this time last year one of the sights of London, are shrewdly ministering to this Spartan mood of economy by providing special luncheons and dinners at reduced prices.

WESTMINSTER, November 21.

In spite of the niggardly disposition of the Press Bureau and the baldness of its literary style, readers of the morning papers get a more or less dim impression of the progress of the biggest battling the world has ever seen. More eloquent are the simple columns cataloguing the names of killed and wounded in action. Still more vivid are flashes of personal knowledge of the operation of the war upon quiet, happy homes of yesterday. Less than a month ago I bade farewell to a friend and country neighbor going to the front. In order to accomplish his heart's desire, he had resigned one of the most highly prized positions of distinguished officers on Home Service. As soon as he was gone his brave and capable wife devoted herself to hospital duties, taking her turn at hard work from four o'clock in the afternoon till midnight or after.

Perhaps such engrossing labor had its compensation in distracting her mind from hourly anxiety. In addition to her husband, three of her brothers, the eldest heir of an historic Scottish dukedom, had gone to the war. Of the two younger, one returned from the battlefield wounded. The other, known to be dangerously wounded, is among the missing. Nothing has been heard of him since he disappeared a full month ago. And now comes a brief summons from Boulogne bidding her repair to the bedside of her husband, who lies in hospital grievously wounded.

Capt. von Müller of the Emden is well known in London, where he has left many friends. He was domiciled here for some years acting as Naval Attaché to the German Embassy. In the spring of last year I met him at luncheon and was much struck by his appearance and manner. Tall, slim in figure, beardless, and innocent of moustache, he had no resemblance to the ordinary type of German. The dissimilitude was carried further by his manner, which was gentle, courteous, and unobtrusive. He did not take prominent part in general conversation at the table, but after luncheon I had a chat with him and was charmed by the variety of his information and the grace of his culture—spelt with a "c" not with a "k." I little thought when we parted that the next time I heard his name it would be a terror to the British mercantile marine.

The funeral of Lord Roberts to-day was made the occasion of a rare display of public emotion. In order to find its nearest parallel we must go back to the burial of the Duke of Wellington, hymned by Tennyson in deathless verse. Lord Roberts also has his Poet Laureate. It has been written that the poet is in some cases also the prophet. The truth of the aphorism is justified in the case of Wordsworth. A hundred years ago he wrote a poem with the incongruously prosaic title "Character of the Happy Warrior." The subject of his monody was his brother, a sea-captain, who had died at his post. I resist the temptation to quote couplets and passages that might have been written to-day by one analyzing and describing the character of Lord Roberts. But the poem is worth looking up for the remarkable coincidence it supplies. Lord Roberts's greatness was equalled only by his modesty. Nothing would have amazed him more than to hear the lamentation at his death echoing from pole to pole, from India, where his name is worshipped, to Canada, that glows with pride and affection at hearing it mentioned.

I made the personal acquaintance of Lord Roberts twenty-one years ago, and was to the end honored by his friendship. The occasion of meeting was a garden-party given by Lord Onslow at Clandon Park in honor of the visit to this country of a representative gathering of Australians. For the convenience of his guests returning to the railway station Lord Onslow engaged the services of a miscellaneous collection of local traps and gigs. Seated by the driver of one I was startled by a sudden exclamation. "There he is. There's Bobs," he cried, his face glowing with animation as he pointed to a slight upright figure in a group crossing the lawn. He told me he was an old soldier who had served with Roberts in India, and the sight of his old chief filled him with gladness. Among many natural gifts Lord Roberts was one of those men who, sharing the quality with Peter Pan, never grow older. It is no exaggeration to say that after a lapse of twenty years his face and figure did not show alteration from the time when I first knew him. Nor did his manner change. He remained the very pink of courtesy, the perfection of simplicity, the model of modesty.

As was shown in the visit to Paris in wintry weather which directly resulted in his death, he spared no pains, shrank from no personal inconvenience, when there was question of doing a useful service. Shortly after he returned from India in 1893 question of the safety of the Afghan frontier came again to the front. In course of a conversation with me on the subject he remarked that it would be well that a journalist accustomed to address a wide circle of readers should be accurately informed on the matter. He, a busy man with many calls on his time, accordingly proposed to come and lunch with me and talk the matter over. I summarized his views in an article written for the *Daily News*, of which I sent him a proof in anticipation of publication. Naturally, inevitably, dealing with the subject, I had something to say of the services he had rendered in India. He returned the proof begging me to destroy it, explaining that he had merely endeavored to inform me on a subject on which from time to time I might have occasion to write. The article was accordingly withdrawn, and as I did not keep a duplicate of the proof Lord Roberts's views on a subject of which he was master are not available.

The Savage Civilian

THE FEROCITY OF THE NON-COMBATANT, AND IN PARTICULAR OF THE GENTLER SEX.

More years ago than I care to think of I had a friend who was a Dutchman. He was also an official in the service of the Transvaal Government, and when war broke out he fought for the Boers under Villebois-Mareuil, was wounded, taken prisoner, and in due time released; whereafter he returned to Holland. While in Africa he married a Boer wife.

About six months after the war was over I happened to visit The Hague and wrote to my friend that I should like to see him. He called at my hotel, asked me to dinner, and added hesitantly that he hoped I would excuse his wife's absence. It happened that I made a mistake about the day, and called sooner than I was expected. I was shown into a room in which husband and wife were sitting. No sooner was I announced than the lady rushed towards me, slapped me soundly on both cheeks, and with a war-like scream vanished from the room. I was only a boy at the time, and not even my friend's explanation that his wife's dislike was intended for the English generally rather than for me in particular comforted me overmuch.

I was at a dinner-party in London a few weeks ago and very tactlessly put forward some mild expression of my belief that the Germans were very probably human beings after all, and that the stories of their atrocities might be exaggerated. Nobody hit me, but I happened to meet next day in Lower Sloane Street the lady next to whom I had been sitting, an acquaintance of some years. She crossed the road to tell me that if I was a traitor to my country I might have the decency to keep it to myself.

Now, it is a curious fact that just as the Dutch husband of the war-like lady agreed with me that the British had not committed atrocities in South Africa, so a man at the English dinner-table who was a soldier and the brother of a soldier at the front entirely agreed that the Germans made a very decent foe, all things considered, and that their "atrocities" were, if not altogether invented, very much exaggerated. I have not dined with any German ladies since the war broke out, but I have very little doubt that, if any German suggested that the English, the Russians, the French, or the Belgians were not blood-stained murderers, plunderers, and ravishers, he would be promptly taken to task as was I myself.

Another curious point which is to be noted just now in the civilian populations—and especially the women among them—of London and Paris—and, doubt it not, of Berlin and Vienna also—is the extraordinary relish with which they anticipate the plunderings, murderings, and ravishings which must follow should the "enemy" *quelconque* ever seize their particular capital. Not one jot or tittle of horror will they dispense with; not one item of all the long category of wars'

infamies since the Stone Age—and woe betide the man who hints that not inconceivably some few unburned buildings, living men, and uninsulted women might be found even after the entry of the barbarous foe.

Per contra, I have discussed the matter with the soldiers of four nations—it is true that the Germans among them were prisoners—and even the Belgians, who might be expected to feel most bitter, were united in finding good words to say for the foe and in insisting that where atrocities took place they were to be blamed solely to individual blackguards, such as are to be found in any great foregathering of men, and not at all to the nation unlucky enough to own them.

I am not talking of the real fear that comes from real ignorance. In the remoter parts of England there are no doubt many people who have never seen a German—just as there must be many Germans who have never seen an Englishman—and who would not be surprised to find, if the invading army did appear, that it was composed of blacks, was horned, tailed, and hooved completely. I know of one perfectly true instance of an old lady, living in the Berkshire Down country, who barricaded herself in her cottage at the beginning of the war from sheer terror that the Germans might be expected at any moment, and would certainly have starved to death had not kindly neighbors wondered at her disappearance. But the phenomenon of which I write is not confined to the ignorant or to children; it might almost be said that the higher the social scale so much the greater is the almost ghoulish appreciation of "foreign atrocities."

The average Englishwoman or Parisienne of the educated class has certainly in her time met at least one German, just as she of Berlin or Vienna has certainly met Englishmen or Frenchmen. They have talked with them, perhaps flirted with them, have found them invariably human—if unfamiliar—occasionally very sympathetic. I have in mind one English girl in the early twenties who not many months ago dined with me as the guests of a German friend, now doubtless in the field if he be not already dead or in hospital. "It is awful to think," she said to me in all sincerity, when the subject happened to be raised between us since the outbreak of war, "what a blackguard the man was all the time." And doubtless in Berlin hundreds of young ladies are saying similar things about Englishmen with whom, six months ago, they were glad to be intimate and to greet with their brightest smiles. At the best, the absent foreigner has been changed by the act of war into a demon of tiger-like ferocity; at the worst he was so all the time, even when he covered his villany with the hypocritical veneer of civilization.

Though silly, such feelings are credible enough; the curious part of the matter is that not fear but relish is the predominant feeling on the part of the civilian at the thought of the coming invasion of barbaritics. Very much as the "white slave traffic" not so very long ago was the predominant subject of conversation at the most respectable suburban tea-tables, so what the peaceful inhabitants (and more particularly the women) have to look forward to, should the enemy succeed, is now absolutely *de rigueur*, and I honestly believe there are whole thousands of women in London, Berlin, or Paris who would be bitterly disappointed if the foreign occupation of their capital failed to produce a crop of unnamable horrors.

I was discussing this very subject with an officer high in the British Intelligence Department in a little French town "behind the firing line" a short time ago, and not only did he agree upon the main point, but he added that not the ferocity of the most ferocious "Freiritter" who ever slaughtered was to be compared with that of his own womenfolk, so far as words at least are concerned. That is true enough, and perfectly reasonable. His womenfolk, I mean, might be pardoned for hating the men who were doing their best to slay their own menfolk. Also, as we agreed, it is confined to words. The German woman tends the wounded English or French prisoner as devotedly as do French and English the German, even though they talk nevertheless of "something with boiling oil in it" for the unwounded free enemy. Both at Newbury in England and at Torgau in Germany, as it happens, indignant patriots have protested at the favors showered by local womanhood upon "enemy prisoners," and a German prisoner himself told me that our kilted Highlanders have proved almost as irresistible to soft-hearted fräuleins as they have to the young ladies of France.

The real reason, my soldier friend and I were agreed, why so many women regard the approach of the horrors of war in their direction with such eagerness that they are furious if you try to discount them, is curiosity. They have read of such horrors—and the better educated the more they have read—but the written word conveys but a feeble image. They want—quite impersonally—to see for themselves, for the race of Fatimas increases all the time and the number of Bluebeard chambers closed against them grows always less. For those of us who have actually seen something of war and what it carries in its train, it is almost impossible to realize exactly how little the words "atrocities," "barbarities," "murders," "pillaging," "ravaging," and the like mean to those who in well-sheltered homes have never had any nearer actual acquaintance with them than comes from the sight of the house on the next street in which a burglary has been committed. You will not find that eager, almost joyful, anticipation of war's horrors in the women—and men and children—from Belgium and Northern France who in their thousands have been fleeing into England to escape the actual wrack of war—as maybe those of Germany into Denmark or Sweden or Holland to-morrow or the day after. There is no anticipation among them—and I have talked to very many—no dwelling upon gory details; only a dull, crushed silence of despair. They have seen.

OLIVER MADOX HUEFFER.

Recent Novels

THE PRODUCT OF THE AUTUMN SEASON—SOME OUTSTANDING BOOKS BY AMERICAN AUTHORS.*

The reader who may have been privileged or fated to become in some general sense familiar with what may be recalled as the ante-bellum—or say precataclysmic—fiction of England and America is likely to have been favorably impressed with the character of the American commodity. As for that desperate hope of the age, clung to by even so exacting a critic as Mr. Howells—the "high average workmanship" which is fit for democratic peoples—English practitioners of the rank and file have already realized it almost beyond our dreams. Somehow, though it is sad for us to admit, and though we have Matthew Arnold's remark about Boston to comfort ourselves with, writing Englishmen as a class use better English, or use English better, than we do. They also, as a class, have a clearer notion of what they are writing about, and more skill in construction. It is astonishing how many recent English novels by new writers have stood clear of mediocrity. On the other hand, we may fairly congratulate ourselves that our recent fiction has been cleaner and more wholesome, if less skilful than theirs. Our story-tellers are busy enough about sex matters, Heaven knows; but other aspects of life remain of importance to them; and mere salacity, though it has infected popular literature, is not yet in the best of standing among us. Certainly, the better American fiction of the season is, as a whole, far more tolerable in the family circle than the better corresponding

The Hidden Children. By Robert W. Chambers. New York: D. Appleton & Co.

The Witch. By Mary K. Johnston. Boston: Houghton Mifflin Co.

The Encounter. By Anne Douglas Sedgwick. New York: Century Co.

The Hands of Esau. By Margaret Deland. New York: Harper & Bros.

The Last Christian. By George Kibbe Turner. New York: Hearst's International Library Co.

The Poet. By Meredith Nicholson. Boston: Houghton Mifflin Co.

Diane and Her Friends. By Arthur Sherburne Hardy. Boston: Houghton Mifflin Co.

The Copy Cat and Other Stories. By Mary E. Wilkins-Freeman. New York: Harper & Bros.

The Mutiny of the Elsinore. By Jack London. New York: The Macmillan Co.

The Lone Wolf. By Louis Joseph Vance. Boston: Little, Brown & Co.

The Honorable Percival. By Alice Hegan Rice. New York: Century Co.

The Nightingale. By Ellenor Stoothoff. Boston: Houghton Mifflin Co.

English product: a test to provoke hearty but not inextinguishable laughter.

I.

Of the score or so of novels I have in mind as pretty well representing the best of current fiction, almost all are, in the nature of things, by well-known writers. Prodigies are rare, and a season which produces new work by Mr. Cable, Mrs. Deland, Mr. Hardy, and Mrs. Wilkins-Freeman would be of note if it had nothing else to its credit, nothing to offer from younger names like Mrs. Watts, Mr. Herrick, and Miss Sedgwick. But a grouping by seniority would be mechanical. We may, for convenience, mention our books as their character rather than their authorship roughly groups them. There are, for example, four novels of some length which attempt to deal seriously with one or another phase of American contemporary life.

In "Clark's Field" Mr. Herrick, who has sometimes seemed to be in pursuit of wandering fires, has achieved, I think, a richer and more stable piece of work than ever before. Heartiness cannot be expected of him: his melancholy is too deep-seated; but the brooding and dubious quality, the plaintiveness, at times fairly enervating, of his earlier novels is far less noticeable here. His leading figure, the girl and woman Adelle, is a singularly healthy and normal person; an "average" person, even an insignificant one in most of her earlier phases. The romance of her inheritance is of the matter-of-fact domestic order—it is such fortune as might come to any one among a thousand mute, inarticulate, shabby, and commonplace little American girls. The real romance—and there is such a thing underlying or contending with all Mr. Herrick's realism—lies in the fact that little plain Adelle is not quite commonplace. She has elements of mind and character which develop too slowly to protect her from the silly accident of her marriage and the suffering which must follow, but not too slowly for her final salvage.

Mr. Herrick might well have called his novel "The Rise of Adelle Clark." Mrs. Watts's theme is strikingly similar. Her Jennie is a personality very different from Adelle, but she is also a personality, she also has a latent force of character, something sturdy and sound born in her, which brings her out of the least promising conditions, through very bitter experiences, to self-comprehension and self-mastery. There is quite as much realism in this story as in the other, and it is a realism which circumstances make more striking. This is, indeed, one of those stories about a girl which one hesitates to put into a girl's hands. Jennie is the waif of a brothel, is educated in a reform school, chooses to be the mistress rather than the wife of the man she loves, and will not marry him even when time has tested the permanence, at least, of his feeling. On larger grounds one's misgiving as to the permanent value of either of these stories as a work of art is based on a sense of their "petering out" a little, being somehow vague and ineffectual in the outcome.

The other two books in this group are of distinctly less merit. Neither represents its author at her best. Mrs. Bacon has attempted a study of a type which has been much attended to by English novelists—roughly, the "Ann Veronica" type, the maiden who is determined not to be maidenly, who openly revolts against the traditional lot of woman, and who makes herself and everybody else pretty miserable in the process. Mrs. Bacon apparently finds her heroine charming in spite of her faults; unluckily, she does not succeed in conveying the charm, so that the reader's joy in her eventual conversion to womanliness, by the somewhat familiar road of motherhood, is not extravagant. Mrs. Atherton's story is a study of American life in a Western setting. On one side it involves a commercial struggle between a Butte mining engineer and mine-owner and a great copper company. The company is as unprincipled as all such companies are known to be, and Gregory defeats it by such boldness and skill as belong to all proper heroes. On its other side the tale concerns the relations of Gregory to his wife Ida and to Ora, wife of his best friend. Ora is the modern married siren, as a character less considerable than Gregory. The one really striking figure in the book is the wife Ida, a heroine to be roughly classed with the Adelle of Mr. Herrick and the Jennie of Mrs. Watts. She also evolves strength out of apparent weakness, and scores against life in the end by virtue of her own mental and moral thews.

II.

Four of our elected novels may be grouped as historical romances. Rather vaguely so the most important of them, perhaps; but "Gideon's Band" deserves a place, if not a high place, among those pictures of Southern life in which the subtle atmosphere of a provincial society which has already passed is caught and made imperishable. Lovers of "Dr. Sevier" and "The Grandissimes" will find something, at least, of the old spell in this tale of the Mississippi. They will even enjoy, as readers of a younger generation may not, the complexities and obscurities which, characteristically, the author does no more than his part in clearing up. In "The Hidden Children" Mr. Chambers has again broken away from his popular commercial successes with what is analogous in literature to the "Broadway public" of the stage. This is a tale of the Iroquois wars, with an ensign of Morgan's Rifles as romantic hero; a very good tale of its kind. Miss Johnston's new story is (many of her readers will be glad to hear) more like her earlier novels, "Audrey" and the rest, than the not altogether happy Civil War series which intervened. It contains, as usual, quite enough of bloodshed and horror to stir the most sedentary reader, and a vivid if hectic picture of witch-hunting in England in the time of King James.

"The Encounter" has historical or biographical interest of a sort, since one of the chief persons is confessedly drawn after "a famous modern philosopher" of Germany, whose memory, we take it, is just now being execrated by all nations but his own. This Wehlitz of the story is a species of male "Tante." His genius happens to be primarily for philosophy rather than music, but he is a masculine embodiment of the same mad egotism which characterized Miss Sedgwick's diva. One has again the feeling that the portrait goes fairly over to caricature. Again, as in "Tante," the young heroine seems not quite up to her part; and again the really striking and living figure is that of a subordinate character. There is a touch of irony in the fact that Mrs. de Selincourt, expatriate and cosmopolitan, is at her strongest in the handling of such both broadly and subtly American types as the old retainer in "Tante" and the delicious Mrs. Fennamy of the present story.

There appear on our little list a number of stories of smaller compass, but not of less importance, than those which have been mentioned.

"The Hands of Esau" is a characteristic study by Mrs. Deland of a primary and poignantly human situation. As always, it is a moral, but not conventionally moral, issue that she is concerned with; and as always her handling of it is, upon the surface, so simple and straightforward as to give the effect of a presentation rather than a subtle study. A reviewer in the *Nation* has characterized it as a "novel of eighty pages which might well have been a short story of thirty." One may say with as much truth that it might have been a novel of four hundred pages. In fact, I think it of precisely the right length—for Mrs. Deland, who has done so much of her best work upon approximately this scale. Our publishers and editors are too generally under the tyranny of the yardstick. "The Last Christian" is upon a somewhat larger scale, but it is a study of a few persons in relation to a phase of religious change which, as so many of us remember, shook New England to its foundations a quarter of a century ago. "The Last Christian" is a parson of the old school, who clings fiercely and hopelessly to his faith in the literal truth of the Scriptures and the old stern doctrine of hellfire, until the higher criticism and Christian Science, and a general laxity and indifference reduce his parish to nothing, and make of his world a place in which he can no longer live. It is a book of genuine power, a faithful and sympathetic epitome of the passing of an ancient supremacy. Another novel in little is Mr. Nicholson's graceful little romance. He is faithful to his customary Hoosier setting, and it is not difficult to guess the original of the genial poet and *deus ex machina* who is more interesting than the story as a story.

III.

The "Diane and Her Friends" of Mr. Hardy represents a relatively new type of fiction (but then there were "The Pickwick Papers") which seems destined to supplant the old-fashioned serial—the connected series of tales, any one of which may be read by itself. The "Get-Rich-Quick Wallingford" stories and the tales of "The Charmed Life of Miss Austen" (Century Co.) are instances of series of this kind, which, after proving very popular in the magazines, have had a second success in book form. Mr. Hardy's work is, of course, upon a much higher plane. Among new collections of detached short stories, the foremost in importance is the "Copy Cat" volume of Mrs. Wilkins-Freeman, in which she shows her complete range, from grim realism to light comedy.

A few other books we may include in our tentative list—two of adventure and two of whimsical humor.

Mr. London's tale displays in an unusual setting his usual vigorous appreciation of tough customers and hard blows, his talent for making one fear the worst when things are tolerably bad, and his relative clumsiness in the necessary business of "heart-interest." His style is as vigorous as usual, but his exciting happenings do not fall as thickly to the square page as we are wont to expect of him. With "The Lone Wolf" Mr. Vance makes his contribution to the ever-swelling popular store of crook-literature. Children cry for it.

"The Honorable Percival," if it introduces no new comedy material, makes excellent use of the old. Mrs. Rice's true-born Briton quite lives up to his monocle, and is properly humbled in the long run by as delightful an embodiment of the young ebullient American female as has ever been seen on any literary stage. "The Nightingale" deserves especial mention, not because it is the work of a new writer, but because, being delightful in itself, it seems to give promise of pleasures to come. Here is "to-day's daughter," the spoiled and young American wife and mother who, for lack of other employment, ails herself and is therefore ailing—here is that indefensible person set off with so much good humor and unaffected laughter that it is impossible to remember to be angry with her.

H. W. Boynton.

Poetry

THE OLD INN.

The ghosts of what dead gallantries
Within your low-ceiled walls remain,
And from those diamond-panes, your eyes,
Look forth again?

The trim lawns still are dewy-pearled,
That oak still guards your crescent drive—
But, since your day, what flags have furled,
And yet men strive!

Within your hall the rafters rung
With toasts that pleased an elder day:
Alas, the old songs have been sung,
And died away!

The mellow candle-gloom is gone,
But the same firelight leaps anew
To char the mantel, and the dawn
Still finds a few—

Still smiles a "Finis" to the tale
That on the world's rim first found breath:
For Love and War shall never fail,
The legend saith.

No more the shrieking brakes proclaim
The distant Coach with News and Friends,
Nor bugle note some chariot's fame
Distinction lends.

Out on the ribbon-road there stands
The sign-post of the final mile,
Whose vigilant new-painted hands
Bid: "Rest awhile!"

And though the motor's acrid smoke
Assails the ancient stable-shed,
The weary guests your charms invoke
As those long-dead.

And quite as fair Milady seems
As she who minced in rich brocade——
Then, long up-stand to house our dreams
Till Memory fade!

W. G. Tinckom-Fernandez.

Some New Verse

The Sea Is Kind. By T. Sturge Moore. Boston: Houghton Mifflin Co. $1.50 net.

Collected Poems. By Norman Gale. New York: The Macmillan Co. $2.

Florence on a Certain Night. By Coningsby Dawson. New York: Henry Holt & Co.

My Lady's Book. By Gerald Gould. New York: Mitchell Kennerley.

Georgian Poetry. 1911-12. Collected by E. M. New York: G. P. Putnam's Sons.

Modern Anglo-Irish Verse. Collected by Padric Gregory. London: David Nutt.

The verse, partly new, partly reprinted, in "The Sea Is Kind," will hardly render intelligible to Americans the hyperboles lavished upon Mr. Moore's work as a whole by English critics of unquestionable discernment. Mr. Moore writes readily, copiously, variously, has something to say, or at least something to utter, in classical, Biblical, and metaphysical fields, and has an air of knowing what he is about, which is effective even when it is misleading. His work is not picturesque, though composed out of fragments of pictures. His style, though loaded, even thronged, with words, seems rather solidified than padded. Melody in any rich measure his verse lacks, but saves itself from commonplace badness and commonplace goodness by being at the same time spontaneous and unconciliating.

The spirit of an age in which writers smooth their own path by obstructing that of their readers is reflected in Mr. Moore's adoption of a style which makes eternal vigilance the price of understanding. His verse is not ill described in his own phrase, "odd freak of shadowy coils and turbid gloom." I as reader feel that the wage hardly corresponds to the work, and if it be said that it corresponds exactly to the skill of the workman, I can only point out that one or two quite verifiable symptoms—the structural laxity of the poems and the absence of decisive resemblance in the comparisons—suggest that the intellectual values which these obscurities veil are not superlative.

In a group of poems for children, Mr. Moore seems trying to impersonate a hearty youngster emitting lusty crows; the crows are rather dream-like. "At Bethel," a Biblical narrative, is a poem relatively clear; its authorship is apparently undisputed. In the poem "To a Sicilian Vine-Dresser, 276 B. C." Mr. Moore is at his best. Hellenic stimulus cannot make him simple or concise (the powers even of the Greeks are finite), but it inculcates a truth which he would hardly have consented to learn from other teachers, the value even to poetry of a cornerstone in actuality. I quote two stanzas:

Gently draw off the clear and tomb it yet
For other twenty days in cedarn casks!
Where through trance, surely, prophecy will set;
As, dedicated to light temple-tasks,
The young priest dreams the unknown mystery.
Through Ariadne, knelt disconsolate
In the sea's marge, so welled back warmth which throbbed
With nuptial promise: she
Turned; and, half-choked through dewy glens, some great,
Some magic drone of revel coming sobbed.

Of glorious fruit, indeed, must be thy choice,
Such as has fully ripened on the branch,
Such as due rain, then sunshine, made rejoice,
Which, pulped and coloured, now deep bloom doth blanch;
Clusters like odes for victors in the games,
Strophe on strophe globed, pure nectar all!
Spread such to dry—if Helios grant thee grace,
Exposed unto his flames
Two days, or, if not, three; or, should rain fall;
Stretch them on hurdles in the house four days.

Mr. Moore's wilfulness is rather tonic; among poets he may belong to a mild species, but in that species he is of the males.

In his "Collected Poems" Mr. Gale conducts us back to simplicity, invites us to a "Sabine farm" in Warwickshire, and sings of flowers, birds, and rural lasses in simple metres and unpretending language. If one falls, somehow, to be duly grateful, it is possibly because one suspects Mr. Gale of not living himself with any exclusiveness on the fruits and lentils which he serves so assiduously to his readers. I find myself in the position of Richard I in "Ivanhoe," who, when served with bread and pulse by Friar Tuck, could not conceal his suspicion

that the goodly hermit harbored secret stores of venison and wine in some nook of his modest habitation. A like suspicion is confirmed in Mr. Gale's case by a vein of lusciousness, hardly significant in itself, but curiously ill assorted with the birdlike and childlike playfulness which the author desires to attain.

Mr. Gale would be a skilful maker of phrases, if phrases were things that could be detached and mounted for individual inspection in even rows in the numbered cabinets of a museum. At times he outdocs himself, and rises to merits quite unforeshadowed by the average level of his fluent, effortless, companionable verse. Among these happier visitations to a muse too hospitable to be fastidious, let me specify "The Danger," "To the Sweetwilliam," and "Shakespeare in the Thrush."

Mr. Dawson's volume falls naturally into two parts. The less significant portion is a group of lyrics embodying the piety or pietism of fifty years ago, rarely but singularly dotted with points which the taste of fifty years ago would have called blasphemous. The life of the volume, however, is comprised in two narrative (or quasi-dramatic) sketches of the Renaissance, "The Hill-Tower" and "Florence on a Certain Night." The second of these, which centres in Leonardo da Vinci, is one of the rarer instances of poetical recital in which the poetry is not hostile to the narrative effect. Still better than this clear-cut work is "The Hill-Tower," in which the error of indiscreet fulness in the treatment of a moderately attractive theme is finely offset by the tingling speed and fiery onset of the martial tetrameters:

> Bianca of the yellow hair,
> With witch-face white as ivory,
> Yield to our might that we may bear
> Thy body back to Rimini.

"My Lady's Book" is a little cluster of twenty intimate love-poems in which the "lady" is cloistered and niched at the same time that she is passionately cherished—a combination of courtliness and ardor for which the original model may be sought perhaps in Rossetti's "House of Life." Mr. Gould's technique is consummate when he cares to make it so, and his verse beguiles us with a rich effect of recessed and embowered privacy. His feeling surpasses in richness and vigor that of many of his contemporaries; the complicating circumstance is his apparent desire to express a little more feeling than he actually possesses. In the following beautiful sonnet the emotion is true and strong, though not quite strong enough to vitalize the hyperboles, and the mastery of rhetoric and rhythm is complete:

> I cannot love my Lady as I would;
> She is past loving lovable—she tries
> With childish hands the portals of surprise,
> And finds by faith those secrets understood.
> She wears the double crown of womanhood;
> Maternal thoughts make bright her maiden eyes;
> Wisdom would not be pure were she not wise,
> Nor goodness beautiful were she not good.
> I have held her in my arms and called her "Sweet";
> Of this high spirit have I said "My own"
> High for all hearts know peace where she is known,
> Her hands are full of service when they greet,
> And round about her in the grievous street
> The happy airs of Paradise are blown.

The Georgian anthology, which is confined to the two years 1911-1912, merits the interest to which the public has certified by buying up nine editions in eighteen months. What the poems disclose is not so much inspiration as character; the writers are ready and firm, favor energy and speed, shun the piddling and the finical, commit themselves fearlessly, and give prominence to matter. This is not genius, I admit, but it is the climate in which genius ripens. The prediction of immortality for any one of the seventeen cited poets would be indiscreet, but the rise of an immortal in their neighborhood is no irrational or remote possibility. Among remarkable things are the finely touched etchings of James Flecker and Walter De La Mare, the packed, if intricate, suggestiveness of Gordon Bottomley and Edmund Sargant, the spurring lines of G. K. Chesterton, the spirited and high-bred ease of Lascelles Abercrombie's masculine blank verse, and the shorter iambics that fairly skate along in the zestful and tingling verse-narrative of Wilfrid Wilson Gibson. If John Masefield and T. Sturge Moore show themselves to less poetical advantage, they are not less happily resolute in keeping the commonplace in abeyance. Some allowance must be made for the illusion which makes the reader of anthologies transfer to each guest a little of the versatility which pertains to the whole company, and for the fact that guestship sometimes evokes a charm which the man fails to maintain as host in his own domicile. The volume as a whole gives suggestion of the breath of literary enterprise and the zest of artistic adventure.

A quite different feeling is aroused by Mr. Padric Gregory's much larger compilation of "Modern Anglo-Irish Verse." The poems are too many, too much alike, and too nearly equal in value to profit by each other's neighborhood. In literature and economics alike, there is undoubtedly an association between plenty and wealth, but there is likewise an association between plenty and cheapness. Both associations are recalled by the present volume. Many of these poems are respectable, or somewhat better than respectable; now and then a distinctive poem from W. B. Yeats or "A. E." or Herbert Trench or Stopford Brooke or John Eglinton reminds us that the Irish are a highly gifted people; but most of these accomplished and creditable verses are not only undistinguished but indistinguishable. They form a kind of mat in the memory. We have ripple, not pulse; fragrance, not savor; sparkle, not glow. Irish nomenclature and setting are plentiful, but, for all the marrow they contain, the verses might have ripened under an English hedgerow.

O. W. Firkins.

Old Coaching Days

ROADS AND TAVERNS OF NEW ENGLAND.

A romantic interest surrounds the history of the highways and turnpikes of New England coaching days. The story of their growth from Indian trails into well-built roads for the accommodation of a coach and four, is a history of the social, business, and intimate life of the time. Over these primitive roads a post on horseback carried the first regular mails between New York and Boston, then the two largest commercial towns of the colonies. Occasionally an ardent traveller, like the Widow Knight, whose diary gives a truly feminine account of big and little accidents by field and flood, made the perilous journey. This was in 1704. As travel increased, a box was mounted on wheels, and furnished with seats without backs: thus, rudely, the "stage" was born into a career of nearly a hundred years.

Travel by means of those tortuous contrivances was a dreaded necessity. It was only at the end of a day of struggle through muddy gullies in the roads, and the fording of bridgeless streams, that the tired traveller found cheer and comfort in the tavern, and discussed the news and gossip of the day over a great bowl of Bamboozle. With such a companion as Jonathan Oldbeck, or, better still, Scott himself, one may pleasantly make an imaginary journey over the old Boston Post Road. The varied and minute learning of our fellow-traveller would entertain but never bore us. The conversation would be humorous, gossipy, and serious in turn. We should meet, on the coach, or in the great barroom of the tavern, men of note and fashion of the day—perhaps Josiah Quincy, of Boston, or Ben Franklin, and, possibly, the great Washington himself.

The historical matter so industriously gathered in Mr. Jenkins's book,* or in such collections as Mrs. Earle's "Taverns and Coaching Days," and the Rev. S. G. Woods's "The Taverns and Turnpikes of Blandford," should furnish the structure for a more readable and life-like narrative than those volumes contain. For, after all,

> The show is not the show,
> But they that go.

With the learned but not diverting Mr. Jenkins for guide, one need not, even at this day, lose the trail of the old Boston Post Road. from Pearl Street, Manhattan, to the old State House at Boston. With him, however, it leads too often to the large towns and cities of the present day; one hardly cares, in a work like this, for a description of the city of Hartford, and a picture of the modern State House. Only on what remains of the turnpikes and taverns of coaching days, the few old houses that look as if Nature had made them into a part of the landscape—whatever time and man have

**The Old Boston Post Road.* By Stephen Jenkins. New York: G. P. Putnam's Sons.

spared out of that grim and romantic past—does the imagination love to dwell.

The golden days of coaching in New England date from the building of the first Concord coach by Lewis Downing in 1815. This admirable vehicle lent a picturesqueness and charm to travel that the world seems never to have tired of. Indeed, one questions if any of the present inventions for speedy travel are so conducive to the enjoyment of natural scenery, good companionship, entertaining talk, and adventure, as the old Concord "stage." With the coming of the steam engine, so far outdoing the coach in speed but not in glee, stage routes in New England were shortened and pushed into remoter regions, to make a glorious retreat before the brazen vulgarity of the trolley-car.

But so late as the 'sixties a few enchanted regions were yet spared to the charm and romance of travel by stage-coach—none, perhaps, more attractive than the one from Lake Winnepesaukee, up through the Saco Valley and the Crawford Notch, to the Franconia Mountains. The first stage of this journey, from Centre Harbor to North Conway, a distance of thirty-five miles, it was the present writer's privilege to travel many times between 1857 and 1865. It was an afternoon's drive through villages that had barely begun to feel the changes that were to rob New England of so much of its old-time custom and color. There was time for observation and absorption of the scenery, whose beauty and grandeur unfolded with cumulative interest as we crept higher and nearer to the mountains. Is it the illusion of Youth, the enveloping haze of distance, that gives coaching, in the days of an era that has passed, so much of charm, romance, and adventure?

In her "Taverns and Coaching Days" Mrs. Earle pays a merited tribute to Charles Sanborn, whose long, sandy beard I seem even now to see waving in the breeze, as I proudly rode beside him on the driver's seat. It may have been called "the box," but I do not remember it so. Had she never heard or known of Peter Hines? He antedated Sanborn by many years; the veteran of a "stage" on which he played one part longer than Jefferson played "Rip," and with as great glory and as rare humor. It was Peter who, in describing the walk of a local celebrity, said that "he stepped high and wide like a man hunting for snakes."

The lover of New England will be grateful to Mr. Jenkins for the industry and patient thoroughness with which he has uncovered the trail of the old Boston Post Road. By the aid of his excellent maps and explicit directions, the highways and turnpikes of coaching days may, for the most part, be followed through various old towns that still hold great natural and historical charm. Many of the ancient taverns are still standing; but they are no longer the oases of protecting hospitality and roystering cheer that our travelling forefathers gladly found them.

They are all gone away.
The House is shut and still,
There is nothing more to say.

J. Eastman Chase.

Correspondence

THE PROFESSORIAL LANDSTURM.

To the Editor of The Nation:

Sir: The note of Prof. Paul Darmstädter in the *Nation* of November 5 serves, I fear, rather to illustrate than to correct the characterization I had given (in a letter published in the issue of September 24) of the methods of patriotic apologetics used by distinguished German professors. My letter called attention to four statements upon important questions of fact in the pamphlet, "Truth About Germany," which statements it described as either false or misleading; and it pointed out the omission, in that ostensibly sufficient account of the causes of the war, of two facts not merely relevant but decisive. Dr. Darmstädter conceives it to be an adequate vindication of his professional brethren to reply, first, that one of the statements in question can now be shown to have been true; secondly, that my letter in turn omits mention of an important circumstance among the antecedents of the present conflict, "the total mobilization of the Russian army."

About the *tu quoque* I need only say that when one criticises an historical narrative for untruth, or for the suppression of pertinent facts, one scarcely obligates oneself to write the entire history over again. Moreover, the German grievance over Russia's mobilization arose only after Russia had formally offered to "arrest her military preparations," upon a definite and entirely proper condition—which condition was rejected by Germany and Austria. Dr. Darmstädter's other point, however, involves an issue of fact concerning which a good deal of misinformation has been put about. It seems worth while, therefore, to deal with it somewhat fully.

"Truth about Germany" declared that Great Britain, by demanding that Germany respect the neutrality of Belgium, simply "asked that Germany should allow French and Belgian troops to form on Belgian territory for a march against our frontier." Dr. Darmstädter's defence of this passage in the pamphlet is doubly curious. "There is *now*," he writes, "ample documentary evidence for the statement that France and England planned to attack Germany by the way of Belgium, and that Belgium was a member of the *Entente*" (italics mine). This sentence noticeably avoids saying that such evidence was available early in August, when "Truth about Germany" was prepared; it therefore, if true, would not absolve those responsible for that volume from the charge of having published a statement, of the utmost significance if correct, for which they had no proof. At best, Dr. Darmstädter merely pays a compliment to their power of divination, a faculty not highly esteemed among historians. What the new evidence is, Dr. Darmstädter does not trouble to mention; but it may be supposed that he refers to the documents found by the Germans in the War Office in Brussels, of which an account was published in the German newspapers shortly before the date of Dr. Darmstädter's letter to the *Nation*. This evidence, as given in the *Norddeutsche Allgemeine Zeitung* of October 13, I have examined with some care. It not only fails to prove the assertion made in "Truth about Germany," and reiterated and amplified by Dr. Darmstädter; it clearly tends to prove the contrary of that assertion.

What is published consists of two parts: (a) A summary, with a few scattered words of textual citation, of certain correspondence exchanged in 1906 between the British Military Attaché at Brussels and the Belgian General Staff, relating to arrangements to be carried out in the event of the sending of an English expeditionary corps to Belgium; and (b) part of a letter by Baron Greindl, for many years Belgian Ambassador at Berlin, written in 1911 to the Belgian Foreign Minister.

In the former part of this evidence, supposing it to be genuine, there is nothing to show that the arrangements for possible action in Belgium by England were other than defensive provisions against the contingency of a violation of Belgium's neutrality by Germany. Subsequent events have not made this contingency seem one for which it was unwise to make provision. Furthermore, Baron Greindl's letter, as reported, contains positive evidence that it was solely to this contingency that the Anglo-Belgian military understanding had reference. The letter is the more credible testimony upon the point, because it is written by a Germanophile diplomat whose feeling towards England and France evidently reflects that of the Wilhelmstrasse. Baron Greindl complains (I translate the *Norddeutsche Allgemeine Zeitung's* paraphrase) "that the plan of the Belgian General Staff for the protection of Belgium's neutrality in a Franco-German war, which had been transmitted to him, *deals only with the question of the military measures to be taken in case Germany should violate Belgian neutrality.*" To Belgium's representative in Berlin, it seems that the hypothesis of a French or English attack upon Germany through Belgium "has just as much probability in its favor." To prove that possible danger lies on this side also, he argues at some length. On this point, however, the letter shows no more than that the Ambassador had learned in Berlin to look upon Albion and all her agents as "perfidious." But he constantly implies that the arrangements made with reference to the possible landing of an English *Hülfsarmee* were, so far as the Belgian Government was concerned, purely defensive in their purpose.

The concluding sentences quoted by the German journal are especially significant. There is a risk, Baron Greindl writes, that the English, if involved in a war with Germany, may land at Calais and Dunkirk and enter Belgium from the northwest.

That would give them the advantage of being able to bring on an action at once, and of meeting the Belgian army in a region where we should be unsupported by any fortress, in case we should choose to risk a battle; it would in any case make it possible for them to hamper our mobilization, or to permit it only after we had formally bound ourselves to carry it out solely for the advantage of England and her ally. It is therefore imperative that a plan of battle for the Belgian army be drawn up in advance with a view to *this* eventuality also. This is required in the interest alike of our military defence and of the conduct of our foreign relations in the event of a war between France and Germany.

Here, manifestly, the Belgian diplomat is writing to his Government in a way which would have been absurd, if there had existed anything approaching an alliance between his

country and England. He assumes that Belgium is not bound to favor England or France any more than Germany. He takes it as a matter of course that if an English army should attempt to pass through Belgium (without a prior violation of Belgian neutrality by another Power), it would have first to meet and overcome the Belgian army, unless the invasion were so sudden as to anticipate the Belgian mobilization. He urges merely that the chance of such a conflict with the Powers of the Entente has been underestimated in Brussels and that insufficient military preparations have been made with a view to it. It would be hard to imagine better evidence than Baron Greindl's letter that it was a settled principle of Belgium's policy that the inviolability of her territory was to be defended against all comers and by all available means. Yet it is apparently upon the ground of precisely this evidence that we are informed that "Belgium was a member of the Entente," and meant to join England and France in a raid upon defenceless Germany! May I express the hope that Dr. Darmstädter's summary of these documents is not an example of the way in which history is ordinarily written in Göttingen nowadays?

I trust I may be allowed space to make, in conclusion, an observation of a more general sort, even though I cannot hope for enough space to prove it by citations. Since my former comment upon "Truth about Germany," that publication has been followed by many others of its kind, from the pens of German scholars of all degrees of eminence, including the highest degree. I have reason to believe that I express the opinion of the majority of American university teachers when I assure Dr. Darmstädter and his *confrères* that this huge mass of professorial pamphleteering with which we have all been bombarded has done little service to the cause of their country and much injury to the credit of their profession.

The German professorate has long been the object not only of respect but of a certain awe and reverence among us. We have at the same time formed certain conceptions of the intellectual and moral qualities reasonably to be expected from professional scholars, above all from the leaders of the profession. It has seemed to us that professors ought to be scrupulous in their published statements of fact, careful in their examination of evidence, and moderately acute in their discrimination of the proved from the unproved, and the decisive from the irrelevant consideration. Scholars, we have felt, ought not to believe all that they see in the newspapers, even of their own country; in reading documents published in newspapers they should heed rather what the document itself proves, than what the headline or the editorial comment says it proves; and they should not affirm "of their own knowledge" about matters in which they have no expert competency, and with which they can have had no first-hand acquaintance. We have gone so far as to expect that trained scholars, as a class, even in times of great popular excitement, will retain something of the critical faculty and manifest some detachment and coolness of judgment; that they will exhibit a greater ability than the average man to understand how a situation appears from a point of view not their own; that they will be less subject than other men to the more frenzied forms of national feeling; and that their public utterances will be characterized by some moral elevation and dignity, and a degree of restraint.

In the writings of Germany's professorial apologists, with strangely few exceptions, the qualities for which we looked have seemed to many of us to be conspicuously absent. We observe the fact less with anger than with a grievous disappointment and disillusion. To not a few Americans the spectacle presented of late by the leaders of German science and philosophy seems scarcely less than what a sincere lover of Germany has called it—"the greatest moral tragedy of the war." ARTHUR O. LOVEJOY.

Baltimore, November 24.

A REPLY TO MR. GALSWORTHY.

TO THE EDITOR OF THE NATION:

SIR: Will you permit me to correct some of the important misstatements contained in Mr. Galsworthy's extended summary of the British attitude towards Germany in the present war, which was published on November 15 in many newspapers throughout the United States?

By quoting the first line of one of the German national airs: "Deutschland, Deutschland über Alles," as if it were the literal sum of a national programme, and by mistranslating it into: "Germany above everything," Mr. Galsworthy distorts into a jingo slogan an innocent avowal of loyalty to country. The meaning of the line is: "Germany, Germany, dear to me above all things." In the second part of the stanza in which the line occurs, Germany is specifically limited to its present geographic boundaries, north, south, east, and west. The intent of the song is the direct opposite of that imputed to it by Mr. Galsworthy. The song is a vow to protect the integrity of the country. The spirit of it is wholly defensive, without the faintest trace of a desire for conquest. Mr. Galsworthy's interpretation of the line is as false as would be an interpretation of the "Star-Spangled Banner" which imputed to the words "The land of the free and the home of the brave" the implication that every nation except the United States was composed of slaves and cowards, and that therefore the United States for the good of mankind felt in duty bound to impose, by force of arms, the blessings of its civilization upon a recalcitrant world.

This misinterpretation is characteristic of the entire article. Half-truths are tortured until they yield untruth; extreme sayings of individuals are recklessly overstressed and generalized; the clamor of jingoes (who form noisy minority groups in all countries), when it speaks in German, is heralded as the concerted utterance of the nation, but when in British, is ignored as a negligible outburst of discredited individuals; candid statements of universal, historic conditions are turned into cynical avowals of a German national ideal of ruthlessness; faults of German temper and manner are wrenched from their compensatory virtues and graces and grossly exaggerated in a perspective of fixed national antipathy; the signally German virtues are slurred and disparaged; the serious German offences are singled out and magnified out of all proportion until they fill the entire field of vision, blotting out the far greater and more numerous British offences, which are perfunctorily regretted in order to be more decorously ignored.

Of such substance, studiously cast in the outward forms of scientific objectivity, Mr. Galsworthy has composed what he "hopes" is a "fair statement of the German position and state of mind." Germany, in his statement, is a monster of iniquity, ruthless, honorless, maniacal in its conceit, recognizing might alone as right. Britain, on the other hand, whose empire is a vast record of weak nations beaten down and appropriated, from the early conquests in India and the Opium War to the subjugation of the two free Boer republics and the strangling of Persia in the present days, is described as the defender of the rights of existence of weak nations, and the champion of international liberty.

Thus Mr. Galsworthy debauches his honor and his talent in order to join the great number of his countrymen who are pouring out over Germany a flood of calumny the like of which the world has not known until this day.

Inexpressibly sad as it is, the fact should be brought home to Americans and to those of the British nation whose honor has not been debauched by this frenzy of meanness, that the chief responsibility for this campaign of calumny rests with the British writers, marshalled by the Official British Press Bureau, at the head of which is a highly paid official of the British Government.

The following, which any one can easily verify, is a fair illustration of the British public spirit. A few days ago, in looking over the war files of the German *Illustrierte Zeitung*, the French *Le Monde Illustré*, and the British *Graphic*, three illustrated weeklies of the better class and of fairly equal standing, I found this condition: The French and German numbers recorded, in pictures of their own and the enemy's armies, navies, and national life, matters of genuine information. Their hostile bias was sharp, but sincere and dignified. When I turned to the *Graphic*, I found drawings like these: a German cavalryman, with a face like a devil, swinging by the leg an infant which he was about to impale on his lance; a German soldier, with features like a fiend, striding over a slaughtered infant and setting his foot upon the body of a murdered woman; and again, a German soldier, designed partly as a wild boar and partly as a fiend, massacring women and children; and so on, until I could not endure looking any more.

In every country there are publications which cater to the lowest passions; but is it possible that the British men and women of the classes which support the *Graphic* can respond to such lust of brutality? Is it possible that a cause which seeks the inspiration of such an orgy of malice is righteous?

There are two kinds of hatred. The one, that of an honest enemy, however cruel, yet acknowledges the gallantry, the uprightness, and the honor of its adversary. This hatred, which has an heroic quality, passes soon after the end of the conflict into mutual respect and sympathy. In fact, at its deepest roots it is fed, even in the passion of fighting, by a certain obscure respect and sympathy. The other, base and malign, spatters the venom of calumny upon the honor of its enemy. This hatred inflicts wounds that do not heal in centuries.

Calumny speaks not only in the roar of coarse abuse of insidious plots. It has many less obvious forms of utterance; and one of them is the pseudo-objectivity of the discourse of men like Mr. Galsworthy, which, by unobstructive distortions, descends to conclusions as vicious as brutal abuse.

It is in times like this that the worth of

men is determined. The tragedy of this war is too great, the causes and consequences of it too profound and far-reaching, to leave room for rancor and wantonness. Only he has a right to be heard who, even in such fateful catastrophes of inner being and outer existence, holds fast to the enduring values of life by which has been nurtured and sustained the best in him and his fellows.

The German people, who are wholly at one with their Government, and who, in this, the world's hour of destiny, have risen to the highest levels of heroism and self-sacrifice, are by their character, by their record of peace and humanity, by the sincerity of their devotion to the noblest ideals, entitled to a judgment which combines the greatest sympathy with the greatest integrity. MARTIN SCHUETZE.

The University of Chicago, November 19.

MINES ON TRADE ROUTES.

TO THE EDITOR OF THE NATION:

SIR: It seems to me that we Americans ought to be able better than almost any one else to view events of the present war impartially, and that, in the fortunate position in which we are placed for reaching a just opinion, it is our duty not to give silent consent to wrongs, but to express a judgment at the time when it may do some good, on whichever side wrongs may occur.

The steamship Olympic, of which I am a passenger, has just put into Belfast, after remaining anchored for some days off the north coast of Ireland until the sea could be swept of mines. Her escape was narrow, as the news reports have doubtless informed you. During the last few days numbers of these mines have been uprooted from the waters through which this ship was steaming at the time the warning came, a warning made possible only by the sad fate of others. The mines were secretly placed along the regular trade route to Scotland and North Ireland. It was a deliberate attempt on the part of Germany at wholesale murder, directed against the citizens of all countries.

Perhaps the German people are not at heart in sympathy with all the methods of their overlords, and will make themselves heard after this first period during which their reason has naturally been obscured by sentiment. No one blames them for their ardent patriotism, but if the German people, and especially those abroad with better opportunities for learning facts than those at home, continue to approve methods such as these, or profess to approve them, they cannot expect to hold the admiration or trust of any one.

ROBERT ANDERSON.

Belfast, Ireland, November 3.

"CULTURE."

TO THE EDITOR OF THE NATION:

SIR: "Culture" is a very prominent word in the newspapers at present, but I wonder how many persons have clearly defined for themselves what it means. I have not the slightest intention of attempting to supply such a definition on my own account. Facts are moving too fast now for definitions to keep up with them. But perhaps we might revive with a certain felicity the suggestive epigram, "Culture is the result of things forgotten."

GAMALIEL BRADFORD.

Wellesley Hills, Mass., November 15.

THE ALABAMA AND THE EMDEN.

TO THE EDITOR OF THE NATION:

SIR: The exploits of the German cruiser Emden, recently destroyed have suggested to newspaper writers comparison with the Confederate cruiser Alabama. Having had occasion, some time since, to go over the official records relating to the search for the Alabama, conducted by the United States navy, I am the rather impressed with certain contrasts illustrating the profound difference wrought in the conditions of naval service by telegraphy, the searchlight, airships, and the like. Thus, while the career of the Alabama was spun out over some twenty-three months, the Emden met her doom within about a tenth of the time. The fundamental difficulty in the search for the Confederate vessel lay in the impossibility of notifying a Union cruiser of her position in time to bring the destroyer to bay. Thus in Sunda Strait in November, 1863, the U. S. S. Wyoming seems to have been within twenty-five miles of the Confederate on the day the latter took and destroyed the merchant steamer Winged Racer, without being aware of her presence. In September the Alabama entered the Cape of Good Hope only five days after the U. S. S. Vanderbilt had left the same anchorage. In November, 1862, both the C. S. S. Alabama and the U. S. S. San Jacinto had been in the harbor of Fort de France, Martinique, at the same moment, but, although the Union commander endeavored carefully to watch the exit to the harbor, the Confederate was able to elude her antagonist and escape under cover of night. On other occasions United States Consuls or other friendly observers were unable to give timely notice to Union cruisers in order that they might intercept the famous rover of the seas. The only exception establishes the truth of the general conclusion. When the Alabama entered Cherbourg harbor in June of 1864 the American Consul was able to telegraph the news of her arrival to the American Minister at Paris, who in turn telegraphed Winslow, commander of the U. S. S. Kearsarge, at Flushing. At last the essential information was afforded a Union commander in season to bring results known to history. On the other hand, it is interesting to compare the surmises of United States commanders with the actual position of the rebel cruiser. Thus the Alabama was believed to be near Bermuda when her log shows her to have been near Trinidad; near the Azores when she was near Porto Rico; near Lisbon when she was east of New York.

Some sixteen United States cruisers are mentioned in the dispatches as being in pursuit of the Alabama, which fact also has to be contrasted with the seventy pursuers of the German destroyers. Doubtless, however, the naval forces of the Allies are not to be drawn upon for the overhauling of German commerce destroyers to a point likely to impair the control of the seas in German waters; and in this respect the two episodes we are comparing bear a close analogy. The paramount duty of the American navy in the Civil War was not to protect our commerce—important as that was—but to throttle the Confederacy by a rigid blockade. The Allies will probably keep the same major operation in the foreground, preferring, as did the Union Government, to lose not a few merchant vessels to seeing any relaxation of the death grip on the enemy.

Literature

JUGGLING WITH ECONOMICS.

The Economic Synthesis: A Study of the Laws of Income. By Achille Loria. Translated from the Italian by M. Eden Paul. New York: The Macmillan Co. $3.

Since 1877, when Loria took his doctor's degree at Bologna, he has written every few years a considerable book, and at shorter intervals periodical articles, on some subject of economics. He has published in the fields of economic theory, of economic history, and of applied economics; a list of his books presents a bewildering variety. When the reader of "The Economic Synthesis," therefore, is told by Loria at the beginning of the preface that it "may be said to sum up the researches of more than thirty years in the domain of economic science, and to form the complement and the theoretic crown of all my earlier writings," he will anticipate the fruit of ripened scholarship and of extended knowledge. Nor will the prospectus of the book disappoint his expectations. The author promises to couple history and theory, to treat economics as part only of a greater social science, to present, as he says, "the omnipresent lineaments, the general and sovereign laws," which determine all economic forms.

In human history, "the process that is common to all the successive economic forms is the association of labor, a constant and invariable phenomenon in all ages; while the factor of immanent instability of all the changing social forms is the coercion that disciplines the association of labor." In the earliest period men work as isolated individuals for lack of inclination or of compulsion to bring them into association. The pressure of population in time forces an association of labor, which heightens productivity and gives rise to income. Income is the surplus product of coercively associated labor, it is like the surplus value of Marx, and is only part, therefore, of the total product of society. Income is of different forms. It is undifferentiated when the means of production are wholly owned and supplied by laborers, so that income and subsistence are merged; it is differentiated when the ownership, and therefore the income, are vested entirely in the class of non-laborers; or, finally, it is mixed.

The essence of human history is the struggle of the recipients of different kinds and degrees of income, which has tended to the advantage of the well-to-do, and therefore has steadily widened the breach of economic inequality. Meanwhile, however, the coercion which has effected the division of labor and the differentiation of income, has grown so burdensome that it has become an intolerable restriction on production itself. The world faces now no mere development of existing economic institutions, but a revolution which will substitute free association for compulsion and will mark the beginning of a new era. "The régime of coercion, of

inequality, and of war, sinks once and for all into the abysses of history, and from its ruins at length emerges the bright and enduring régime of liberty and peace."

It is but fair to recognize that this summary gives only a bald outline of Loria's argument. Two peculiarities of his method forbid an attempt to reproduce his thought in greater detail. In the first place, he gives to common words, the word "income" for illustration, a technical significance, which he qualifies and elaborates by special terms of his own; so that the reader is faced by the difficulty of acquiring a new vocabulary before he can hope to understand the text. Even more discouraging is the author's habitual disregard of his own definitions, which frustrates constantly an attempt to apprehend his ideas, and which must raise doubts whether he actually holds ideas which can be explained and defended by the approved methods of logic. The reader finishes this book on the laws of income with an angry realization that he has been juggled with, that the terms change their significance in every place to suit the need of the author's argument. It is, of course, a wonderful thing to see a conjurer produce a rabbit from an empty silk hat. The spectator's admiration is diminished if he discovers that the performer put the rabbit in the hat before taking it out; and this is a process that Loria constantly enacts. He covers his tricks by a dazzling display of references to books in many languages, including Russian, by bold generalization from isolated facts, by a wealth of big-sounding phrases, by adeptness in the methods of all the schools. The product is a very clever imitation of a great book; but it lacks all substance of reality.

Loria distinguishes three stages in the evolution of human labor: the prehistoric, isolated labor; the historic, coercively associated labor; the stage of final equilibrium, freely associated labor. The book begins by an account of the organization of society in a period of which we have no historical knowledge, fortified by references to Hahn's "Hausthiere," Humboldt's "Nouvelle Espagne," and an article on "The Colonial Policy of Germany," published in a Russian periodical in 1906. No reference is given for a proof, by algebraical methods, of the terms on which prehistoric producers exchanged their wares. The book closes by a picture, not quite so vivid in detail, but warm and attractive in coloring, of the impending stage of economic equilibrium. The imminence of this change in the United States is shown by the institution of societies for coöperative production, and by the establishment of a coöperative mine, the Caledonia, in Michigan. "Simultaneously in the Great Republic, there come into existence all kinds of free associations, such as that of the Colonial Dames, that of the Sons of American Civilization [*sic*], and numerous workingmen's societies. Everywhere free groupings and voluntary federations arise to replace passive obedience."

If we seek to determine the value of Loria's knowledge of the unknown past and of the unknown future by a critical estimate of his knowledge of recorded history, we find him, in the handling of facts, as in the handling of theory, an unsafe guide. He has read widely, and cites references in abundance. He quotes some of the best authorities in economic history. But the spirit of their work has never touched him, and he is content, in history as in theory, to achieve his construction by piecing together unrelated fragments. He holds the old-fashioned village community theory, and cites Seebohm, of all writers, in support of its liberty and equality. He makes Vinogradoff appear to support his contention that the growth of the coercive association of labor was determined by the relative infertility of the soil. He solves the problem of mediæval serfdom by the formula V=R+x; it is hardly worth while to tell what he means by the terms of this formula, but it is of the first importance to realize that Loria explains in technical catallactic terms an organization which existed by the absence of exchange, and dissolved as economic exchange grew up. The craft gilds appear to him, even in their later period, as examples of "undifferentiated income."

Loria's position is that of the mystic, who disdains the tedious methods of the ordinary seekers after enlightenment and surrenders to the promptings of a direct personal revelation. There may be in his suggestions the germs of great truths; but this at least is certain: he gives us no *reason* to think so.

CURRENT FICTION.

Landmarks. By E. V. Lucas. New York: The Macmillan Co.

"If this story were told on the cinematograph"—the introductory words of Mr. Lucas's latest collection of episodes describe the novel itself and are a kind of literary confession. All his stories have been of the nature of a series of moving-picture scenes cleverly strung together without much plot or thought of construction, and all have been in their way delightful. In the first and best of them, indeed, "Over Bemerton's," the lover and his lady met in the opening scene, and played their parts with fair consistency through all the diverting incidents that followed, and the tale had also a certain wisdom of unity in diversity, lent to it by the wonderful discovery of the book of Chinese biographies, with its unfailing application to every situation of life. But the next best, we think, is this story of "Landmarks," which is just a frank succession of episodes in the career of an honest young Englishman who comes to London to find his fortune, and of course his wife. The hero, unheroic, indeed, but most likable, takes up writing, and his first book is made up of sketches of the second-hand bookshops of London and their quaint keepers. One sighs to think how much pleasure is missed because Mr. Lucas did not use the writer's adventures in that delectable land somehow as a comment on his adventures in the actual streets and among the very living people of the city. The past and the present may be so winsomely jumbled together by an author who knows old books and modern eccentrics as well as does Mr. Lucas.

But if something is missed, a great deal is found. The town and characters portrayed are a delicately etched imitation of Dickens, with the darker shadows and the forced sentiment also omitted, and with the atmosphere of Mr. Lucas's own genial Bohemianism over all. The shams are there, too, the rich and ineffective American amateur, the posing young women with luring shallow eyes, the famous authors who look, and are, so commonplace; but the satire is only fun, and subdued laughter is, after all, the more prudent way to deal with the literary cliques who have been, and may still be, disporting themselves so seriously in the palaces of profitable modern Grub Street. And the heart of the people Mr. Lucas really likes is true and their thoughts clean. Of some of these we get only momentary glimpses; others appear and reappear in many scenes; and their niceness forms the real unity of the story.

Hoof and Claw. By Charles G. D. Roberts. New York: The Macmillan Co.

In the gentle art of nature-faking, which a few years ago was becoming, at the hands of Mr. Burroughs and other literal souls, so wide an advertisement, no practitioner has been more persistent or more successful than Mr. Roberts. W. J. Long is no longer in this field, and the voice of Mr. Thompson-Seton grows fainter year by year. But Mr. Roberts is evidently prepared to work his vein to the last thread of pay ore. The market justifies him. The present sketches have all obtained the final award of publication in popular magazines. They are builded according to an apparently infallible recipe: two parts animal characteristic and habit, one part "nature," or background, and one part "pathetic fallacy." This writer is uncommonly successful in conveying an impression of the atmosphere of the wilderness, or "wild," as he prefers to say. Sometimes it is a "wild" peopled only by its native "kindreds," and the little dramas of life and death at which we are invited to assist include no human actors. But this is rare; almost always there is a human figure within range, woodsman, trapper, or voyageur, sometimes as spectator, sometimes as conscious or unconscious participant. A man is treed by an elk, and a fight that follows between the elk and a lynx is determined by a can of molasses, in the woodsman's abandoned pack. A bear-cub is adopted by a dog, and when he grows up establishes his identity by trying to wag his tail. The humor of the physical contrast between the ways of man and the ways of wild animals is made much of.

On the other hand, and of more importance, perhaps, to the popularity of this type of tale, these animals are always being presented to us in human terms. This is not done symbolically, as in the Æsop

BUR NGAM PUB LIB

fables or the Kipling "Just-So Stories," but as if literally. The bear and the otter and the moose are represented as thinking and feeling, inspired by love and hate, jealousy and revenge, adjusting their conduct to unusual exigencies, putting their human adversaries to shame by the flexibility of their mental processes, and their human friends by the warmth of their attachments. This method evidently extends the field of the "nature-writer" almost without limit. More scrupulous observers, like Mr. Burroughs or Mr. Dallas Lore Sharp, must be continually observing new things to find "copy." There must be an end to mere description, whether of a lion or a tomtit. As hero of fiction, a creature with mane or tail feathers, instead of sweater or frock coat, but otherwise virtually human, what limit can be set for the usefulness of a Child of the Wild?

The Wall of Partition. By Florence L. Barclay. New York: G. P. Putnam's Sons.

Ten years before, when Madge had dismissed him, Rodney had recklessly taken to globe-trotting and the writing of best-sellers. Poor chap, could you blame him, when Madge simply wouldn't stop to hear how a slight cerebral hemorrhage was entirely to blame for the dreadful letters displayed by the blackmailing person—not only wouldn't stop to listen, but had unfeelingly closed the door upon all possibility of explanation by precipitately marrying another man? All that he had suffered as a consequence, with stern insistence upon the devastating effects of such treatment upon masculine character, he had put into a Great Novel—a class quite apart from his best-sellers, be it understood—and published under a *nom de guerre.* This great work is just bursting upon the English-reading public when he returns to London. The loneliness of this man, who is famous under two names, in a London flat, is something sad to read about. Not a friend in town, apparently, but his publishers—his only solace a mysteriously Kind (female) Voice that calls up regularly to say good-night, with blessed tenderness, and is ere many nights entrusted with all the secrets of his heart and pen.

When the telephone friendship reaches this confidential stage, and a meeting in the flesh is proposed by the Kind Voice; when he learns that the Kind Voice's domicile adjoins his own, and rushes over to call; when Madge, the now widowed Madge, who has yearned in secret over his solitary homecoming, and availed herself of a recent change of telephone numbers to solace his loneliness—when this charming, distinguished, and still desirable Madge advances to meet him with outstretched hands, readers of the rasher sort may be led to exclaim, "Thank Heaven, this must be the end." But hold, says Mrs. Barclay, not so fast. This by no means amounts to a novel of my usual size, nor does it contain half my usual quota of Bible verses. I must needs harden my hero's heart with indignation at having been led to betray his inmost feelings over the telephone, and should this resentment not be proof against the warmth of Madge's graciousness, I will confront him with a grave moral question, to wit: Has he still the love for her that a husband should have for his wife, or would it merely be a gross piece of self-indulgence if he gave in to the lady and married her now? The solution of this poser will call for some lingering in country churchyards, and allow a motherly bishop's widow to bring into play her late husband's whole arsenal of favorite texts. Further, the story may be stretched to include a fiend of a lady who shall presume to arrogate to herself the honor of the Great Novel's authorship, and otherwise do her best to deserve a tragic taking-off, which shall be duly accorded her. Consequently, it is some time after the story is really over before Rodney and Madge are finally permitted to hang up their receivers.

A THIRTEENTH-CENTURY BATTLE OF THE BOOKS.

The Battle of the Seven Arts: A French Poem by Henri d'Andeli, Trouvère of the Thirteenth Century. Edited and translated with introduction and notes by Louis John Paetow. Memoirs of the University of California. Vol. IV, No. 1. Berkeley: University of California Press.

The quarrel between the ancients and the moderns we have always with us. Like the mythical battles of the Hjathnings, it is daily renewed with unabated vigor. It was very much alive in Horace's day, to go no further back. In his Epistle to Augustus he pleads eloquently in behalf of the moderns to a generation which had not left off preferring Ennius and Lucilius; and though for the rest of that century the moderns carried all before them, the next witnessed a reaction in favor of the ancients. And the whirligig of time has not yet done sporting with the question.

So numerous are its disguises that it does not easily submit to a formula. Even more than politics it delights in oddly assorted bedfellows and strangely matched opponents. It places a barrier between a lover of the classics like Ronsard and a lover of the classics like Boileau; it takes pleasure in beholding in seventeenth-century France ardent Catholic and equally ardent skeptic allied on the side of the moderns; it finds satisfaction in ranging scholars like Cheke and Ascham in opposition to the enrichment of the English vernacular from classical sources, leaving such important work to be done, let us say, by Gabriel Harvey; in its irony it makes Swift the defender of the ancients against Bentley.

It is of Swift's immortal "Battle of the Books" that the English reader first thinks, with its phrase "sweetness and light," which in some quarters at least was the phrase that made Matthew Arnold famous. But Swift's skit is, after all, only a precious bit of flotsam come ashore in one of the backwaters of the oceans of discussion which inundated the seventeenth century, chiefly in France. In its most philosophical moments this discussion might be regarded as a conflict between the view, sometimes at any rate, held by the ancients, of the progressive degeneracy of mankind and the view just beginning to be held by the moderns of man's perfectability. But too often, when the question did not turn on mere personalities, or a rationalistic attack, in the manner of Zoilus, on Homer, or the authenticity of the Letters of Phalaris, it did hardly more than debate whether the Christian centuries were more productive than the pagan. The cleavage was chronological, so that Perrault could claim his arch-enemy Boileau for the moderns, and Swift, following as usual the hints of Temple's "Essay," could thus carelessly slip into assigning the astonished Nicolas a command in the modern light-horse. Too often, that is, the seventeenth-century discussion was pretty much of a piece with the mediæval *certamina* between water and wine, or the adherents of knight and clerk.

In the Middle Ages themselves, however, in a manner that strikingly resembles the temper of more modern days, the debate took a more practical turn. Are the classics, since they are certainly not financially remunerative and possibly mentally corrupting, worth studying at all? was then, as now, a form of putting the question. The modern answers are sufficiently familiar, but Dr. Paetow deserves the thanks of students of literary history for his present contribution to the mediæval discussion. Already in his dissertation, "The Arts Course at Mediæval Universities," Dr. Paetow had done not a little to correct, following among others Rashdall and Haskins, a misconception concerning the uniform opacity of the centuries between the fall of Rome and the fall of Constantinople. He has helped to make clearer that the quickened intellectual interests of Western Europe at the close of the eleventh and twelfth centuries found expression not only in a renewed study of law, medicine, and dialectic, in the foundation of universities, and in the rise of a brilliant vernacular literature, but also in the cultivation of classical studies, to such an extent that John of Salisbury could obtain, as part of the varied course he pursued at Chartres, a training in Latin literature scarcely inferior to that offered by the universities of the Reformation.

Even at Paris, too, from Abelard to John Garland, Latin authors received some attention, but Paris was too far gone in dialectic, especially since the recovery of the "new" Aristotle, to take much interest in the new Humanism. Indeed, in the twelfth and thirteenth centuries, Humanism, as always, was on the defensive, and presently a combination of other interests choked its fair promise. Among the causes of the decay of classical studies, deeply lamented by men like John of Salisbury, Peter of Blois, Jean de Hauteville, and Alexander Neckam, Dr. Paetow points out the absorbing fascination exerted by logic, the attractions of science, the drift towards the lucra-

tive professions of law and medicine, the popularity of modern, that is contemporary, neo-Latin literature, and a certain amount of clerical uneasiness touching the possible usefulness and the probable dangers of meddling with the ancients. In result, classical studies entered upon an almost total eclipse in the thirteenth century. To Petrarch's century it looked as if things had uniformly been in their desperate case since Rome fell, and ever since the world has been often too ready to accept at its face value that very suspicious commodity—one age's judgments concerning its more or less immediate predecessors.

In Henri d'Andeli's poem, which Dr. Paetow sumptuously lays before us, this unavailing struggle of humanism against the more brilliant and more practical interests of the day is vividly recorded. In method it is an astonishingly spirited anticipation of Swift. The combat is between the forces of Paris, commanded, as we should expect, by Logic, and those of Orleans, one of the last strongholds of classical studies, under the leadership of Grammar. Homer, Claudian, Donatus, Persius, and Priscian, together with some less noteworthy contemporaries of the poet, encounter the Parisian forces, among them Common and Civil Law, Rhetoric (a highly practical study, then much affected by men of legal inclination), avaricious physicians, Necromancy, Astrology, Arithmetic, Geometry, and Music; Theology meanwhile had withdrawn to the wine cellars of Paris. Donatus strikes Plato, and Aristotle Priscian. Thereupon Persius, Juvenal, Horace, Vergil, Lucan, Statius, Sedulius, Propertius, Prudentius, Arator, Homer, and Terence all set on Aristotle. To his assistance rush Boethius, Macrobius, Porphyry, and some of his own works. Meanwhile Grammar does deadly execution with a participle and the point of her adverb, but is finally discomfited by Socrates, because she cannot answer all his questions, and the forces of Logic carry the day, leaving a number of neo-Latin authors dead on the field. Then the rear guard is brought into action under the command of "Primat" of Orleans and Ovid, with such success that Logic sends a message to Grammar which the ignorant scion of Logic was, to his shame, unable to expound. But on his return Logic comforted him and took him to her high tower:

> Si le voloit fere voler
> Ançois que il peüst aler.

At this point the general confusion is reflected in the state of the MS; one almost looks for Swift's *nonnulla desunt*. Grammar, it appears, withdraws to Egypt and Sir Versifying is honored only among the Bretons and Germans (perhaps said in bitter jest). But Henri boldly prophesies that the next thirty years will see a generation that will go back to Grammar, as was the case when he was born. Nearly thrice that time elapsed before his bold prophecy was fulfilled. The present edition contains text and translation, with full illustrative notes and handsome photographic reproductions of the two extant manuscripts.

THEORIES OF TEXTUAL CRITICISM.

Recent Developments in Textual Criticism. By Albert C. Clark. Oxford: Clarendon Press. 1 shilling.

The Primitive Text of the Gospels and Acts. By Albert C. Clark. Oxford: Clarendon Press. 4 shillings.

The newly appointed Corpus Professor of Latin at Oxford has published, in the first of the works under review, his inaugural lecture. After paying fitting tribute to his famous predecessor, Robinson Ellis, he touches on various matters with which the textual critic of to-day must reckon. He shows how Latin palæography as revolutionized by Traube must examine national and local scripts with a minuteness not known before; how the history of the transmission of texts has thus acquired a new definiteness; how an attitude of conservatism is fostered by an increasing knowledge of the history of texts and the practices of the mediæval scribes; how the study of the papyri induces an increased respect for manuscripts of even the latest date; and how the nature of the prose-rhythm employed by ancient and mediæval writers must be familiar to the editor of a text. These are the chief topics lucidly discussed in what at first might seem too technical a discourse for the occasion. They lead up to a matter of very general interest. Starting with certain peculiarities in the text of Cicero, a subject in which Professor Clark is an acknowledged expert, he applies results gained there to well-known problems in the text of the New Testament. A fuller presentation of his views is given in the second of the works before us.

Readers of the revised version of the New Testament who do not relish the brackets enclosing the beautiful story told by St. John (vii, 53-viii, 1) of the woman taken in adultery will approve Professor Clark's thesis. It is that this passage and others of doubted genuineness, notably the ending of St. Mark's Gospel (xvi, 9-20) are all contained in the primitive text and were omitted merely by the negligence of scribes. Since in the ancient majuscule codices the script was written continuously, without division into words, we can often calculate with some certainty, as Professor Clark has shown in the case of Cicero's works, the contents of lines or leaves or quires of an ancestral manuscript. After elaborately counting the letters in many passages of the New Testament, he attempts to show that the primitive text was written in narrow columns with lines, on the average, of ten or eleven letters. Many of the shorter omissions are intelligible on such an hypothesis, and the larger omissions contain like units or multiples of like units. Thus the story of the angel at the pool of Bethesda (St. John v, 4, only in the "Western" text) contains 167 letters, an addition of the Western text in St. Luke v, 14, contains 166, another such addition after St. Matthew xx, 28, has 320, the story of the adulteress 829, and the ending of St. Mark 964. The larger figures are, nearly enough, multiples of the smallest, and all the passages can be easily arranged in lines with an average of ten or eleven letters. Over a hundred fragments of text, large and small, from the Gospels exhibit the workings of what the author calls a decimal system. Though many of these passages are wanting in the oldest manuscripts, they are abundantly represented in the Western group and form part, Professor Clark believes, of the original text. Why, then, are they not in the older manuscripts? Origen and the Alexandrians, adhering to the methods of the ancient Homeric critics and possessing a keen scent for interpolations, detected evidence for these in what were merely accidental omissions from the primitive text. Collating their material, they prepared a new and "scientific" edition which replaced the primitive text, best represented by the Western group, just as Westcott and Hort have replaced the *textus receptus* on the parson's shelf to-day. This is a highly attractive theory which receives apparent support from history, common-sense, and minute statistics. It makes protest against those modern critics who, like Marcion, would copy the scriptures rather with the sword than with the pen.

Professor Clark is well aware that the problem is delicate, many-sided, and not to be solved by arithmetic alone. He purposely restricts his treatment to mechanical considerations to which insufficient attention has been paid. Restricting our judgment to such data, we find that even they must be further elucidated to become significant. Any passage can be readily divided into parts as minute as lines of eleven letters, which may sometimes sink to nine or rise to twelve. One need not count the letters in all the New Testament or any part of it to be sure of this result. Many of the smaller omissions are single words with καὶ or are very short phrases or end in the same words or syllables which have immediately preceded. In all such cases scribes frequently omit, whatever the length of the line. We turn for a real test, therefore, to the larger units—columns and pages and leaves. If the passage in St. Luke v, 14 (166 letters) and that in St. John v, 4 (167 letters) represent columns, then the ending of St. Mark (964) occupied a leaf with three columns on a page. This seems a promising clue, which other scholars have suspected before. If there were another such case, we could perhaps verify the theory by grouping the intervening letters into an exact number of leaves. Unfortunately, the next longest passage, St. John vii, 53-viii, 11 (829) makes only five columns. It is not easy to see why a scribe should omit a page and two-thirds. Was the primitive text, then, in the form of a roll, not a book? In this case five columns could as readily be lost as six. But Professor Clark makes it probable that the original volume was not a papyrus roll. He further seeks to explain certain possible transpositions in the fifth, sixth, and sev-

enth chapters of St. John on the basis of columns of 168 letters. The sections of text concerned are *a* (33 columns), *b*+*c* (26 columns), and *d* (6 columns). The present order, if we must suppose it a wrong order, is *b*, *a*, *d*, *c*. How to account for the change in terms of shifting leaves is a mystery. If, as before, we calculate six columns to the leaf, *d* makes a leaf, but the other sections are incommensurate. The results for the Acts, in which there are no long passages to consider, seem somewhat surer: at least, certain of the added readings in the Western text appear too good for a glossator.

Thus after a perusal of these careful statistics, we are left with a few interesting possibilities and a welter of uncertainties. After attempting a few countings of letters to test the method, the reviewer feels in danger of the condition attributed to St. Paul: *τὰ πολλά με γράμματα εἰς μανίαν περιτρέπει*. Professor Clark asks us to suspend judgment until the publication of his latest studies in the text of Cicero. This we do, registering for the moment an opinion of *non liquet* as to his primitive text of the Gospels and the Acts.

Gift Books

From the press of Hodder & Stoughton, imported by George H. Doran, we have received some extremely artistic reprints. Henry Newbolt's stirring collection of poems of the sea, published under the title of the initial poem, "Drake's Drum," has, appropriately to present circumstances, been republished in a handsome holiday edition with a dozen spirited illustrations in color by A. D. McCormick. From the same house comes a welcome edition (we believe the first published) of that masterly little dramatic preachment and satire of J. M. Barrie's "The Admirable Crichton"—by the way, is it not time for an American revival of this play? The format of the volume is worthy of its matter, and the plentiful illustrations, in color and line, are from the graceful brush and pen of Hugh Thomson. We associate this artist more with the dainty designs of the period of wigs and powder than with the dress of to-day, or, in this case, of yesterday, and though these drawings are facile and pleasing, it must be admitted that he is happier when dealing with "costume" subjects. It is pleasant also to find a new edition of "The Vicar of Wakefield" (Holt) among the season's publications, and one hopes that it may portend a revival of interest in a masterpiece and its author too much neglected in these days. The volume is handsomely got up, and the numerous illustrations, many of them in color, by Edmund J. Sullivan, reflect delightfully the spirit of the work.

A particularly sumptuous volume is the new edition of the late Andrew Lang's "Oxford" (Philadelphia: Lippincott; $3 net). Not, perhaps, since Lamb, from the standpoint of the humble layman, wrote of "Oxford in the Vacation," has any writer caught and set down the spirit of Oxford, the charm of her history, with such sympathy as did Andrew Lang, writing with an intimate view, in the present volume. The sixteen full-page illustrations in color by George F. Carline are both worthy of the text and are in themselves paintings of exceptional beauty. For any lover of Oxford this is a book to recall rare memories; and for any lover of good books it is one to handle with fondness.

From Hodder & Stoughton (Doran) we have received, in a handsome edition, "East of the Sun and West of the Moon," which is a collection of stories of primitive folk, for the most part reprinted from Sir G. W. Dasent's "Popular Tales from the Norse." Such titles as "The Lassie and Her Godmother," "The Lad Who Went to the North Wind," and "The Three Princesses of Whiteland" will bring back to readers at all familiar with Scandinavian legends the peculiar flavor of Northern sagas. In no other folk-tales is there quite this combination of pensiveness, eeriness, and good human striving for better things. The illustrations by Kay Nielsen, who knows Scandinavia firsthand, have a strong intermixture of poetry, and sometimes show a surprising daintiness, suggestive indeed of Japanese drawings. Hodder & Stoughton (Doran) also send to this country a charming edition of "Sindbad, the Sailor and Other Stories from the Arabian Nights." It goes without saying that the artist, Edmund Dulac, has chosen the familiar, though never trite, episodes for his illustrations. In addition to Sindbad's experiences with the whale, the rokh, and the snake, much is made of Aladdin's adventures, of "The Story of the Three Calenders," and of "The Sleeper Awakened." Altogether, this is a most satisfactory gift-book. Adults, as well as children, will rejoice that John Galsworthy's "Memories" has been brought out specially for the season (Scribner; $1.50 net). He must be a stout hater of dogs who does not find pleasure in the black shaggy "Chris" as he emerges both from the text and from excellent illustrations by Maud Earl. We are tempted to say that the artist understands the ways of dogs quite as well as the author, and in her own manner can express them as vividly.

Laurence Hope's excellent adaptation of "India's Love Lyrics" is issued with holiday embellishment by John Lane Company ($5 net). The sensuous beauty of the text is generally known, and of itself presents striking visual images. For this reason the task of the artist, Byam Shaw, was particularly difficult, but he has contented himself with symbolic figures, which, though highly colored and at times a trifle stiff, are sufficiently vague not to interfere with one's preconceptions, while at the same time being decorative. "Lohengrin" is this year added to the stories made famous by Wagner which have been placed in the holiday list. The text of T. W. Rolleston is used, and the artist is Willy Pogány, the excellence of whose work has become thoroughly familiar to readers during the past few years. Full justice is, of course, done to the delectable swan, who even on the stage as a mechanical device is never quite rid of personality. This is a satisfying book to pick up in odd moments (Crowell; $5 net).

R. L. Stevenson's "Fables" come to us from the press of Scribner in an edition decorated by E. R. Herman.

After the thirty-second chapter of "Treasure Island" [the book begins], two of the puppets strolled out to have a pipe before business should begin again, and met in an open place not far from the story.

And then begins the tales told by the author, Cap'n Smollett, and Silver. The love of Stevenson still continues, and readers will welcome this book. "Our Sentimental Garden" of Agnes and Egerton Castle comes from the press of Lippincott ($1.75 net), with illustrations by Charles Robinson, mostly in black-and-white, but some of them gayly colored. The book offers a pleasant retreat to those whose experience with gardens in winter must be vicarious.

The season would hardly be complete without an edition of Dickens's "A Christmas Carol." This comes to us from the press of David McKay (Philadelphia; $1.50 net), attractively illustrated in line and color by A. I. Keller. Henry Holt & Co. publish a very handsome edition of "A Mid-Summer Night's Dream," with bold type, wide margins, and a most attractive cover. There are twelve colored plates and sixteen illustrations in line by W. Heath Robinson, who has found here a subject admirably suited to his whimsical fancy and his delicate and skilful draughtsmanship. A glance through "The Kipling Calendar" (Suliy & Kleinteich; 50 cents net) raises the doubt whether Kipling is adapted for the purposes of a calendar. Certainly not very many pages reveal the helpful touch which it is the mission of calendars to supply for every day in the year. The same firm publishes "The Dinner Calendar," by Fannie Merritt Farmer, and "The Dickens Calendar."

Notes

We have received the second number for 1914 of the *American Oxonian*. This magazine, which represents the interests of Rhodes scholars, past, present, and prospective, of the United States, is a new venture started last April. Beginning with January next year, it will be published quarterly, under the editorship of Frank Aydelotte, Bloomington, Indiana. The subscription will be $1 a year. The first issue of the new year, it is stated, will be especially designed as a handbook for prospective Rhodes scholars. The intent of a publication of this kind stands in no need of commendation. There are already four hundred Rhodes scholars in this country, and thirty are added annually to their number. Nevertheless, there is prevalent, not only among laymen, but in the schools and universities, a wide misconception and not a little prejudice regarding the purposes and benefits of the endowment. One of the objects of the *American Oxonian* will be to dissipate this cloud of misunderstanding. An excellent start in this direction is made in the present number in a most interesting symposium on "The Lack of Competition for the Rhodes Scholarships." Not only for ex-Rhodes scholars, but for educationalists in schools and colleges who come into contact with those who might like to compete for the scholarships, if they properly understood the advantages of the endowment, this new quarterly should prove invaluable.

The second volume of the Report of the Commissioner of Education for the year ending June 30, 1913, contains the statistics, running to 600 closely printed pages, covering "57 States, Territories, and possessions of

the United States, approximately 1,200 cities, 14,000 high schools, 900 kindergarten systems, and 1,000 private kindergartens, 1,150 colleges, universities, and professional schools," and so on, to "675 summer schools, 1,000 museums, 15,000 libraries, and several thousand educational associations and societies." The report deals with the facts relating to the school attendance of more than 25,000,000 children (and adults), and the expenditure of three-quarters of a billion of dollars. No wonder that the Commissioner remarks that he does not know of any other agency which "attempts with so little money to collect, compile, digest, and interpret so large and varied a mass of statistics from so wide a territory." The convenience of the two volumes would have been greatly increased at slight additional care, by making the index at the end of the second volume cover both, instead of providing each with its own index.

In "English Literature Through the Ages" (Stokes; $2 net) Amy Cruse endeavors by telling the stories of individual books from "Beowulf" to "Catriona" to set up "a series of bright lights, which, . . . although they do not mark every winding and every change of level, yet do show the main features and general outline of the road" of English literary history. Addressed as it is to the four million, the author makes many simplifications in her narrative—as, that "Tamburlaine" marks the beginning of Elizabethan drama, and that Marlowe (with no mention of Nashe) wrote "Dido of Carthage," a title which is obviously a modern improvement over "The Tragedie of *Dido Quene of Carthage.*" Incidentally she is able to settle many questions which have occasioned extended debate among scholars; we are informed, for example, that "about six months after *Dr. Faustus* was put upon the stage, another play dealing with the same subject was produced by Robert Greene." The statement not only throws a flood of light upon the character of "The Honorable Historie of frier Bacon and frier Bongay," but will keep any one from bothering himself further about its date. With all of this certitude on moot points, however, there is too little illumination from the "bright lights" along the road. A summary of each book, of no particular distinction, many interesting heterogeneous facts about the authors' lives, a few critical—but not too critical—remarks on various productions, three score of portraits and other illustrations—these hardly furnish a unique contribution to human wisdom or happiness.

Half a century ago Barthélemy Saint-Hilaire published the third edition of his deservedly praised "Le Buddha et sa religion." A translation of this work has just been issued by Kegan Paul, Trench, Trübner & Co. (Dutton; $1.25 net), devoid of any indication that "The Buddha and His Religion" is not a modern work. Worse than this, the old notes, good fifty years ago and well-nigh useless now, are still retained without addition or correction. We mention this chronological absurdity only to warn readers against it. As a specimen of the value of the book to-day may be cited the note on p. 133: "Burnouf has translated some of the most important Jātakas."

Mr. L. G. Chiozza Money must be classified as a State Socialist—if he is to be classified at all. The opening chapters of "The Future of Work" (London: Fisher Unwin; 6s. net) are a powerful argument for the "Great State" as the best means of obtaining proper economic results for all. According to his preface, "The paucity of output by our competitive system, after more than a century of production by power, is demonstrated, and an attempt is made to outline an industrial system calculated to yield a full harvest to science while securing for the individual, albeit in an organized society, a maximum of personal liberty." This is the theme of a large part of his book. Whatever may be the reader's views on the subject of Socialism—state or otherwise—he can hardly fail to be impressed by the author's indictment of present productive methods on the score of their inefficiency. Even if all that Mr. Money undertakes to demonstrate be not wholly demonstrated, enough remains to give one food for serious thought as to whether, on the whole, free and unrestrained competition in production and sale of commodities *is* quite the best way to bring the greatest good to the greatest number. One need not, however, be a Socialist—nor even a "Great-Stater"—to see good in coöperation carried to lengths much greater than anything yet actually tried. Perhaps we can learn something to our advantage by going part of the way with Mr. Money on these matters, without following him to his goal. Later chapters in his book, viz., on Gold Supply and Gold Prices (wherein he acquits the yellow metal of being anything worse than partial accessory to the "high cost of living") and on the Single Tax (which he handles not merely "without gloves," but positively with "brass knuckles") are interesting and provocative of discussion.

Messrs. Harper & Brothers have brought out, in attractive form, "The Story of Our Navy" ($1.50 net), by William O. Stevens, a professor of English at the United States Naval Academy. Whether such a book was needed, in view of its many precursors of similar nature, and whether it fully redeems the promise of its Introduction to present its subject in its larger aspects may be questioned, but the oft told tale loses nothing in Mr. Stevens's repetition. The work is carefully done. Its results are commendable for general accuracy of statement, the few errors noted being unimportant. It would have been well to mention the indispensable part played by the "Advisory Board" of 1881 and 1882 in recreating the navy; to give further details of Commander Sicards's ingenious measures to preserve the lives of the Saginaw's crew when cast away on Ocean Island; and to describe Commander W. B. Cushing's vigorous action in Santiago de Cuba at the time of the Virginius affair, action only less praiseworthy than the sinking of the Albemarle. To the author's association with Capt. G. R. Clark is doubtless due the account of the latter's repairing and operating the Tientsin railway during the Boxer troubles—an excellent instance of energy and resource. The Naval Chronicle is an admirable feature. But why did a professor of English descend so frequently to a flippant, not to say slangy, style, even if he was writing for boys?

An amiable specimen of eclectic thinking is E. F. Carritt's "The Theory of Beauty" (Macmillan; $2). Various philosophies of the beautiful he explains and criticises "in respect of their harmony with those facts of æsthetic consciousness which it was their business to explain." From the hedonistic-moral theories of Plato, Tolstoy, and Ruskin to Lipps's theory of *Einfühlung,* from the realistic-typical theory of Aristotle to the expressionist theory of Croce, he everywhere finds some soul of goodness in things evil. His exposition is presided over by a nice sense of proportion. Kant and Hegel, though classed as intellectualists, he discusses in separate chapters, while the emotionalists Nietzsche and Schopenhauer he disposes of in a single chapter. The Italian critic and philosopher, Benedetto Croce, he accords the honor of the longest and most significant chapter, avowing candidly: "I believe that a greater amount of truth is contained in Croce's *Estetica* than in any other philosophy of beauty I ever read." This estimate does not deter him from making sly thrusts at Croce's efforts to combine elements of Schopenhauer and Hegel, nor does it prevent him from directing an assault at the citadel of his whole system, that is, the identification of intuition and expression. It must be confessed that the undertaking does not issue in conspicuous victory, because in executing it he adopts a realist position that Croce would instantly reject as untenable and inconsistent with his philosophy. Indeed, it reveals the chief weakness of the entire review of æsthetic thought from Greece to Germany. He confesses that "many metaphysical ghosts slumber uneasily in the surrounding shadows," but he nowhere seeks to conjure them by defining his own bias as realist. However, he has the excuse of aiming at no ultimate philosophy, of proceeding on the belief that "problems, like temptations, will be always with us." For the layman the procedure is probably an advantage. Certainly the writer's winning modesty, his mastery of the original languages of the thinkers criticised, his evident appreciation of the intuitive views of the poets, his catholic temper, will render his lucidly and brightly presented exposition of various æsthetic systems a welcome introduction to the subject.

"The General Federation of French Workers has never failed to smooth out any international complications which have arisen. Let us recall the serious tension which existed in the year 1900, between the English and the French nations; that between France and Germany in 1911; the Balkan war in 1912, and, lastly, the campaign which we have waged in France against the reintroduction of the three years of military service." "In their thoughts and aims the German and British workers are one." These statements, made last year at the Trades Unions' Congress in Manchester by the French and the German delegates, respectively, are quoted towards the end of Prof. Adam W. Kirkaldy's little book, "Economics and Syndicalism" (Cambridge Manuals of Science and Literature; 40 cents net). For reasons that need not be given, their interest is greater now than when they were spoken. The title of the book does not accurately define it, for it is a sketch, after a fashion, of the development of economic thought from Aristotle to the Syndicalists, with the object of making out a case against both Socialism and Syndicalism. Other recent volumes of special timeliness in this series are "The Royal Navy," in which John Leyland traces the influence of the British fleet upon British history, and "Military History," by the Hon. J. W. Fortescue. "The Sun," by Dr. R. A. Sampson, gives the present position of ascertained fact and intelligent theory regarding that important body; "Coal Mining," by T. C. Cantrill,

sets forth the history and methods of one industry, and H. R. Procter's "The Making of Leather" does the same for another.

A writer in the *Bulletin Critique*, reviewing a book on Bernadotte, says: "This drama has no prologue." The prologue in question Mr. D. Plunket Barton proposes to supply in "Bernadotte: The First Phase; 1763-1799" (Scribners). Here, then, we have a biography with a *raison d'être*—by no means an invariable accessory to modern lucubrations of the kind. That the work is very well done it is only just to premise. Contemporary records have been ransacked, and the result may be regarded as definitive so far as candid and conscientious research can make it. For us the book is chiefly interesting as answering, in a large measure, the author's own question: "How did it come about that this exranker from Gascony, this child of the revolution, bred as he had been in barracks and battlefields, succeeded, during more than thirty years, in charming the aristocratic court of Sweden as their Crown Prince and King?" Born at Pau, birthplace of Henry IV, of a bourgeois family, Bernadotte enlisted in 1780, was captain in January, 1794, and general of division in November of the same year. A born leader of men, he fought his country's battles in Belgium and Italy, served as Ambassador and later as Minister of War, until, after the *coup d'état* of Brumaire, he fell for a time under the shadow of Bonaparte's predominance.

It was in connection with the *coup d'état* of Fructidor that Bernadotte first made acquaintance with politics. At this critical moment "Bernadotte seul se montra modéré," says Sorel, adding significantly, "était-ce instinct de roi latent?" And this moderation—shall we say decency?—had distinguished him throughout his early military career. He alone of the republican generals treated the conquered with restraint and humanity. His soldiers of the Sambre et Meuse were nicknamed "messieurs"—which gave considerable offence when they joined the "citoyens" of the army of Italy. The fiasco of his embassy to Vienna brought upon him much obloquy, but his tact and urbanity gained him personal respect which stood him in good stead afterwards. When *coups d'état* were in active progress he always contrived to be elsewhere—a fact which has not been accounted to him for righteousness by patriotic historians. But he was a hater of disorder and a firm upholder of the powers that be—at this period of his career, at all events. This attitude logically explains the position he took at the time of the *coup d'état* of Brumaire, when he stipulated that he would act if called upon by the Legislature. The call was not forthcoming, and Bernadotte remained in the background. Yet his was no self-seeking policy. "He is honest," said Bonaparte. "But for his obstinacy, my brothers would have bought him over." "A typical Bearnais—brave, resourceful, impetuous in action, cautious in affairs . . . If he had self-love, he had also 'self-reverence' and 'self-control,' qualities which Tennyson ranks among the forces that 'lead life to sovereign power.' In the end they led his life to sovereign power."

Six years ago some women members of the Fabian Society formed the "Fabian Women's Group" to study the matter of woman's economic position with regard to Socialism. In "Women Workers in Seven Professions" (Dutton; $2) Miss Edith J. Morley, professor of English at University College, Reading (England), has collected and edited seven essays, each dealing with a profession employing women in England. These professions are teaching, medicine, nursing (including midwifery and massage), health visiting, civil service, clerkship, and acting. Miss Morley explains that this volume is the first of what she expects will be a series in which the results of the six years' work of the Group will be given to the public. The essays now published are in the main the substance of lectures given to members of the Group and other women by women of experience and have brought together a mass of information not heretofore collected in convenient form. It is impossible to summarize in a few lines the content of such a volume—which consists, indeed, mainly of facts and figures—but Miss Morley in her preface points out that almost all the contributors agree upon certain fundamental things, and "definitely express the conviction that women need economic independence and political emancipation. . . . The writers are unanimous in their insistence upon the importance—to men as well as women—of equal pay for work irrespective of sex" (p. xv). The attempt to exclude married women from professions is also vigorously rejected. The book is excellently documented, and reflects much credit upon the authors of the various essays—as upon the editor herself—for the calm and scientific spirit that it displays.

"Nature," "Society and Solitude," "Heroes and Hero-Worship," "Morals," "Literature and Democracy"—so run the essays collected under the general heading, "The Spirit of Life" (Mitchell Kennerley; $1.50 net). Either the author does not fear comparisons, or he is indifferent to them. And indeed these pages are free from imitativeness or emulation. Moreover, a comparison of their writer, Mowry Saben, with Carlyle or Emerson would be as much out of place as a comparison between, let us say, Mr. G. S. Viereck and Longfellow or Lowell. Mr. Saben happens to be a professional "editorial-writer," but these papers are not reprinted leaders, nor do they carry the smell of the sanctum. There are more distinct traces of his extended university training in America, England, and Germany; these are the essays of a student of philosophy rather than of a newspaper man. But they are the work of a consciously "modern" thinker, a person a little impatient with the inefficient past and defiant of the smug present. He is fond of such utterances as this: "The higher morality is never conventional. It is never Puritan, it is never Philistine. For the highest morality has to bid defiance to custom in order to get the sweetness of poetry and music out of life. . . . The moral man is the man who is right when God measures him, not when his neighbors measure him. A great soul will always seem immoral to the bulk of his contemporaries, if they succeed in probing into his essence." There is, of course, a kind of transcendentalism in this, as in: "All reform means liberation; it means a new freedom somewhere. When we shall have secured the free mind and the free body, the task of the reformer will be over. The Conservative and the Radical will then be as one." Or on a more mystical plane, in this final sentence of the book: "If in our highest ideals we may find the real meaning of our personal lives, because they are the quintessence of the spiritual universe, whose avatars we should be, then there is nothing too glorious for the heart of man to conceive." The book is by no means all in this vein of speculation, there is much plain speaking upon concrete matters of life and conduct; and the writer chooses more than once to lead his readers, in the name of freedom, upon decidedly boggy ground. With that passage, for example, which he hopes will "shock a great many people," he may have his wish; we are not clear that they will earn the name Philistine by turning from the ideals and the logic of a writer capable of pronouncements like this: "It will not do for the man or woman who indulge [*sic*] from necessity their hetero-sexual tastes to throw stones at the man or woman who indulge from necessity their homo-sexual tastes. One might as well stone a painter because he is not a sculptor, or a sculptor because he is not a painter."

When we read, for example, that, since ninety-five per cent. of the crimes committed remain unpunished, while fifty per cent. of business men come to bankruptcy, therefore crime promises a more prosperous career than honest business, and that, since appointee-judges are accessible to venal influences, therefore hereditary judgeships will be a guarantee of purity, we are tempted to drop the book in disgust. By such logical irresponsibilities and dull-pointed paradoxes does Emile Faguet, in "The Dread of Responsibility" (Putnam; translated by Emily James Putnam; $1.25 net) satirize and condemn the average Frenchman's aversion to a sporting view of life. Yet, logic apart, his argument is not wholly without substance. Whether French judges are more slavishly bound to law and precedent than our own, we shall not pretend to say—to American institutions, which he calls republican rather than democratic, M. Faguet is everywhere gratifyingly, but rather inconsistently, deferential. But the average Frenchman's preference for "a title and a salary," however small, his dread of more than two children, his anxiety for his daughter's *dot* and for a moneyed husband to match it, his attempt to establish a political system which shall work automatically—all these point to a smug and rather mean view of life which is apt to result in stagnation. On the other hand, M. Faguet seems to forget that responsibility points in two directions: towards initiative, and, at the same time, towards solidity. And recent events should be enough to convince him that France is not yet stagnant, nor has democracy issued in cowardice.

Of Hans Breitmann and his ballads many Americans have first heard through Kipling's praise; and while the humorous songs of this German-American "gentleman who drinks, fights, and plunders" have run through numerous editions in England, they have been so neglected in this country as to be available only in the original, poorly edited volumes published by a firm in Philadelphia in the middle of the last century. One reason for this neglect was the cloud cast over the career of Breitmann's creator, Charles Godfrey Leland, as champion of the Indian and as educational reformer, by the persistent confounding of his personality with that of the uproarious Hans;

for his sensitiveness on this score prevented his ever making an effort to revive the publication of the ballads in America. It was contemporary history, moreover, which gave them much of their early popularity, for Breitmann as soldier and "bummer," politician and globe-trotter, did a great deal to sustain the country's cheerfulness through the dark days of the Civil War period. Those who appreciate the fact that Breitmann was a worthy follower of Hosea Bigiow and more than a worthy forerunner of Mr. Dooley, and that the ballads unite a real philosophy with a Falstaffian humor, will be pleased by the issue of a definitive American edition under the editorship of Leland's biographer, Elizabeth Robins Pennell (Houghton Mifflin; $7.50 net). There are notes on many of the ballads as well as a careful bibliographical introduction, and paper and binding are worthy a memorial edition.

Detached from their romantic past, the heyday and goal of European adventure, the Spice Islands have hitherto flourished outside the tourist radius, though, thanks to Wallace, Java, Sumatra, Borneo, and the islands of the archipelago have long been the hunting ground of the naturalist. Centuries before Paris was ravished by the beautiful plumes of the bird of paradise Chinese traders were gathering them for their own mandarins, and have since virtually effected a "corner" in their export to Europe. Under the benign government of the lethargic Dutch the population of the islands has increased enormously, and, favored by the fertilizing ejecta of their volcanoes, the islanders, with a minimum of effort, flourish through the advantages derived from prodigal Nature. Indeed, Mr. J. Macmillan Brown in "The Dutch East" (London: Kegan Paul; $3.50 net), sees in this benefit the economic demoralization of the native. Despite the polyglot nature of the races, Javanese, Malay, Polynesian tribes, Hindu, Chinese, and even Japanese, the tongue of the wily Malay is the official native language.

JUVENILE BOOKS—I.

There is no indication of an immediate change in the trend of children's literature; in fact, fashions seem to have settled down into a deeper rut than usual, and the only new note sounded is that of war. "The Story of Our Army for Young Americans" (Dodd, Mead), is much more an historical survey of our important wars than a description of the elements constituting our army in the crucial periods of its history. Willis J. Abbot, however, writes well, and the accounts of the Revolution and the Civil War are full and graphic. "The Boy's Book of Famous Regiments" (McBride), is by the illustrator, H. A. Ogden, assisted by H. A. Hitchcock. It recounts the history and exploits of the regiments of all countries, and, as an up-to-date feature, the final chapter deals with some regiments of Europe in the Great War of 1914. Perhaps the most ambitious volume among the many advertised is "The Boys' Book of Battles" (Houghton Mifflin), a collection of exciting stories and poems taken from literature, and arranged in a most spirited anthology. Good reproductions of many historical paintings embellish an altogether well-made book. In fiction, a story like Donal H. Haines's "The Last Invasion" (Harper) is calculated to raise comment, for it is the prediction of a future war between the United States and a Blue Army, much resembling one of the armies now at war, in which at first we get the worst of it, but finally, thanks to our aeroplanes and dirigibles, come out victors.

For the theorists who yearly discuss what young people like to read, and what are the best sources for teachers, mothers, and librarians to go to for information, we have Orton Lowe's "Literature for Children" (Macmillan). Of practical assistance to the story-teller will be Frances Jenkins Olcott's "Good Stories for Great Holidays" (Houghton Mifflin), a perfect storehouse of selections, from Xenophon and the *Gesta Romanorum* to Abbie Farwell Brown.

Edward Cave's "The Boy's Camp Book" (Doubleday) will find its immediate public. For the author, instead of theorizing, has made an exact record, based on an encampment of a Boy Scout troop. The consequence is that all one wishes to know about health, equipment, discipline, cooking, and fun is contained in this handy little volume. "Indian Scout Talks" (Little, Brown) will be as eagerly read by the Camp Fire Girls as by their brethren; it makes available some of Charles A. Eastman's own Indian experiences. The spirit of "The Boy Scout" (Scribner) is excellently caught in a rapidly moving short story by Richard Harding Davis.

When we touch on the Boy Scout movement we touch on nearly all the fiction that is written nowadays for children; that type runs neck and neck with the college story, and is becoming just as conventional. The practical book is likewise serviceable to the Boy Scouter and the Girl Camp Firer. "Harper's Book for Young Gardeners" (Harper), therefore, is likely to be found in many camps next spring and summer. A. Hyatt Verrill should know exactly what information the youngster is most likely to seek, for he has had wide experience in preparing the "How to Make" kind of manual. This season's book takes up gardening of all sorts: the garden for profit, the garden for ornament, the garden practical. No soil should be too discouraging to the reader of this complete guide!

The reprints and special volumes for the young are fewer than usual. A rich edition of "Hans Andersen's Fairy Tales" (Harper) has been copiously illustrated by Louis Rhead. This is one of a series which should be called to the attention of shoppers. "The Arabian Nights" (Rand, McNally) is newly illustrated by Milo Winter in a series of color plates of certain grotesque excellence. Whoever edited the volume is a believer in footnotes to explain various words and passages. "Alice's Adventures in Wonderland"—perennial joy since Charles Dodgson penned it fifty years ago—comes to us from the press of Hodder & Stoughton, in new dress and with new illustrations by A. E. Jackson. The latter are excellent in draughtsmanship and coloring; there is humor, too, in their conception and composition, and even at times a reminiscent flavor of the original immortal characters of old Tenniel. Strictly speaking, they are both more beautiful and more artistic than were Tenniel's drawings, but they lack his joyous inspiration, and we do not like them half so well. "The Jackdaw of Rheims" appears in a gorgeous edition (Winston; $3 net). Twelve handsome color plates and numerous pen-and-ink drawings by Charles Folkard show us the progress of the mystery of the loss of the cardinal's ring in a way that enhances the fun of this immortal Ingoldsby Legend.

From the Oxford University Press comes in one volume, simply but beautifully printed, Hawthorne's "Wonder Book and Tanglewood Tales," with colored illustrations.

An interesting edition of "Andersen's Fairy Tales" (Doubleday) has been illustrated by Dugald Stewart Walker, who has taken the pains to explain many of his conceptions in fantastical language totally out of accord with the simplicity of the stories themselves. The pen drawings and decorations, rather than the colored full-pages, are distinctive, though at times the details are overcrowded. The Every Child Should Know series has grown to important proportions in the reissue of the "Myths" volume (Doubleday), illustrated by Mary Hamilton Frye. The typography and format of the volume are commendable, and the contents are well chosen. A large, roomy, splendid edition of Kenneth Grahame's "The Golden Age" is issued by John Lane. R. J. E. Moony's illustrations for it are disappointing, but the cover design is enough to set one dreaming. Without reservation we may recommend the charming volumes in E. P. Dutton's half-dollar series of Tales for Children from Many Lands, of which sixteen are announced and half a dozen have reached us. Bound in blue, green, and gold and with plenty of colored illustrations the books are an exceptional bargain at the price. The titles are "Robinson Crusoe," "Arabian Nights," "Water Babies," "Hans Christian Andersen," Harriet Martineau's "Feats of the Fiord," for which Arthur Rackman has done the pictures, and the delightful "Pinocchio." Even better than Rackman's pictures we like Maxwell Armfield in the Andersen volume. Mr. Armfield has done a rare thing in looking at the characters of fairyland as a realist. Pleasing, too, are Margaret W. Tarrant's pictures in the "Water Babies."

Longmans, Green elected Henry Newbolt as the successor to Andrew Lang in their holiday list, and he writes "The Book of the Blue Sea." The activity by sea of 1805 and the excitement of Trafalgar are excellently told by one who has deservedly made a reputation, both in prose and poetry, as a writer of the sea. Though Lang has his official successor, there have come to our desk four reprints of the series which he conducted for so long—"The Red Book of Heroes," "The Olive Fairy Book," "The Crimson Fairy Book," and "The All Sorts of Story Book." No more welcome reprint could have been decided upon than Noah Brooks's "The Boy Emigrant" (Scribner), a tale of excellent character, full of good writing and healthy national spirit. This story is nearly fifty years old; it was one of the earliest serials in *St. Nicholas*, and time has robbed it of none of its freshness. H. T. Dunn, after the manner of Pyle and Wyeth, has painted a series of pictures which bring out all the poetry and excitement of the text. Another favorite we cordially welcome is Mrs. Molesworth's "The Cuckoo Clock" (Lippincott), though we think it unfortunate that Maria L. Kirk's color plates are not more in accord with the old-fashioned quality of the story itself. Incidentally we can recommend other volumes in this Stories All Children Love series, published by the Lippincotts. Joel Chandler Harris is always a splendid gift, especially when "Uncle Remus" is in question. Houghton Mifflin, in their Visitors editions, have included "Uncle Remus and His Friends," illustrated

with views of the author's home in Atlanta, and of Snap Bean Farm.

There is a plentiful amount of material in the field of biography this season. Particularly notable is a collection under the title, "More than Conquerors" (Century), by Ariadne Gilbert, which in straightforward and pungent style records the careers of such men as Scott, Lamb, Emerson, Phillips Brooks, Thackeray, and Edwin Booth. We have not met with a more agreeable series of sketches in a long while, and we feel assured that the volume will be welcomed as a distinctive supplementary reader in schools. Oliver Clay's "The Treasure Finders" (Duffield), is also a collective series of adventures of four centuries, telling in accurate manner how explorers from Lief Ericson to Hudson opened up a new world to England, France, Spain, and Holland. As a gift-book for a boy old enough to take an intelligent interest in his country's history, nothing more suitable can be imagined than Frederick Trevor Hill's "Washington, the Man of Action" (Appleton), illustrated in old-fashioned style, appropriate to the subject, by the Comte de Breville ("Job"). "Helmet and Cowl" is the title of a volume of attractive make-up and illustration, by W. M. and M. F. S. Letts (Stokes). It tells the stories of some of the early saints and of the knightly orders of the Middle Ages. John Esquemeling's "The Buccaneers of America, or the Pirates of Panama, a True Account of the Famous Adventures and Daring Deeds of Sir Henry Morgan and Other Notorious Freebooters of the Spanish Main" has been edited and illustrated as a gift-book by George Alfred Williams, and published by Stokes.

A splendid intention dominates "When They Were Children" (Stokes), Amy Steedman's recounting of the childhood of famous men and women. She deals with forty-five heroes and heroines, from Saint Augustine to Stevenson, from Saint Catherine to Louisa Alcott. H. E. Marshall's "Boy Kings and Girl Queens" (Stokes) is of similar design, and seems to us a delightful way of learning history.

Helen Ward Banks's "The Boys' Motley" (Stokes) is a version for young readers of "The Rise of the Dutch Republic." A very rich and sumptuous volume, with poorly reproduced color plates by Walter Crane, is Mary McGregor's "The Story of Greece" (Stokes). This will prove an excellent foundation for nursery stories, and we recommend its use at an early age, for our classical knowledge is being sorely neglected. Still another book of classical stories for children that we can recommend is Hilda Johnstone's "Stories of Greece and Rome" (Longmans). The tales of Greece, with one exception, recount in simple but spirited language the main incidents of the epic of Troy; those of Rome take up the story with the escape of Æneas, and carry the legend of early Rome to the expulsion of Tarquin and the defence of the Tiber bridge by Horatius.

A nice little set of individual biographies, under the general head of "Heroes of All Time," has been imported by the Stokes. We have before us René Francis's "Augustus," Ada Russell's "Alexander the Great," A. E. McKilliam's "Alfred the Great," E. M. W. Buxton's "Jeanne D'Arc," and Beatrice Marshall's "Sir Walter Ralcigh." The cheap cover design is by no means indicative of the worth of the contents. Other volumes will be added to the series.

There is not a year when we can say that the field of fairy tale and legend is neglected by the publishers. In fact, though it would seem that education is ignoring imagination, the yule-tide books bring forth material enough to rejuvenate the most matter-of-fact school-board curriculum. Such a volume as Janet M. Clark's "Legends of King Arthur and His Knights" (Dutton), though not as spirited as Howard Pyle's narratives, will nevertheless supplement whatever casual mention is made of the Round Table in the nursery. The present author knows her Mallory and Tennyson, but she has caught none of the chivalric tone of either. In *format* the book is done in the regular Nister fashion.

Jeremiah Curtin's posthumous "Fairy Tales of Eastern Europe" (McBride, Nast), has an explanatory introduction by J. Walker McSpadden. The author was the translator of "Quo Vadis," and in the present instance the new volume indicates that he was a very worthy collector of folk-lore from Russia, Hungary, Bohemia, and Servia. Houghton Mifflin are the publishers of "Black Tales for White Children," gathered by Capt. C. H. Stigend and his wife, from Swahili.

Louey Chisholm's "In Fairyland" (Putnam) is the usual retelling of our old favorites, to accord with the author's theories regarding how much children can understand, and how strong they can stand it. We always turn to the retelling of "Little Red Riding Hood," and frown if it has been mildly modified. We are frowning! Penrhyn W. Coussens, in his "The Diamond Story Book" (Duffield), vies with Lang's series. The sources of the tales are varied, and indicate that the editor has searched systematically for what he considers to be the best. A volume of fairy stories somehow reminiscent of Kipling's "Puck of Pook's Hill," but more poetic in coloring, if narratively less interesting, and thoroughly modern, is Margaret L. Woods's "Come Unto These Yellow Sands" (Lane).

In passing, let us call attention to the "Arthur Rackham Book of Pictures," issued by the Century Company, with a sympathetic introduction by Sir Arthur Quiller-Couch. All of the plates are not intended for the nursery, but the interpretation of some of the fairy tales is very dainty. Similarly the full humor of text and illustration in E. Boyd Smith's "The Early Life of Mr. Man" (Houghton Mifflin) appeals rather to maturity than to infancy, and promoters of "sex instruction" will certainly pick a quarrel with Mr. Smith for perpetuating in his text the legend of the stork and in his illustration that of the cabbage patch. Nevertheless, the really rollicking humor of the pictures will be appreciated by all the seven ages of "Mr. Man." This is a book that it would be good fun to expound to an intelligent child. Cecil Aldin's animals have almost become a regular feature of the holiday publishing season. This year's contribution is the "Bobtail Puppy Book" (Hodder & Stoughton).

In "The Book of Friendly Giants" we have Eunice Fuller's defence of giants, and she puts up a good case, especially convincing after we see how a real giant behaves when he takes a little tenement boy to Central Park, and does not even step on a single soul as they go up the Avenue together. Many of the tales in this volume are drawn from foreign sources, and they are accompanied by some excellent drawings by Pamela Colman Smith.

Science

A FASCINATING STUDY OF PLANTS.

Physiological Plant-Anatomy. By Dr. G. Haberlandt. Translated from the fourth German edition by Montague Drummond. New York: Macmillan & Co. $6.50 net.

A pioneer who has opened a new domain, and has seen it occupied promptly by those who have recognized its possibilities, must take much satisfaction as he reviews his early work. This satisfaction must be all the greater if he has welcomed the newcomers in a kindly spirit, and has never regarded them as intruders. Professor Haberlandt began his work as a pioneer in 1881, and published a summary of his early results in 1884, in a treatise which has now reached its fourth edition. During the intervening thirty years he has continued his fruitful activity by the side of those who have been led by his example to explore this new field of investigation. The field is that along the border between Plant-anatomy and Plant-physiology, which, like all borders, had been sadly neglected. There is apt to be much waste land near the fences, which richly repays cultivation. Professor Haberlandt has made this land his own.

The English translation is accurate and readable. The translator has succeeded in the difficult task of preserving the style of the original, which is chatty, confidential, and very attractive. But, owing to the fact that the treatise is primarily designed for advanced students, extremely technical terms are employed even at the outset, which may cause difficulties for the general reader. The author plunges directly into his subject, and assumes that the layman must make use of the index and the dictionary. The translator had to follow copy: perhaps a French translator would have preferred to give suggestive and explanatory equivalents.

The author faces boldly the fact that since "any particular physiological function appears to the observer to be the aim and object of the correlated structural features, every demonstration of a connection between structure and function naturally assumes a teleological aspect." But, as Professor Haberlandt well says, the value of a teleological explanation depends entirely upon the philosophical attitude of the author, and, further, all the phenomena with which the physiological anatomist is concerned partake of the nature of useful adaptation. But though it is impossible to deny the actual existence of purposeful adaptations, physiological anatomy, which describes the adaptive features of the internal structure of plants, is incapable of explaining their origin, and "indeed does not profess to do so." In this branch of science an experimental method must be employed, although it is subject to severe limitations. Like the comparative method, it is of very great value, but it also has its weak

points. Haberlandt has endeavored throughout to maintain a judicial attitude.

After a brief but satisfactory description of the vegetable cells and tissues, the author considers the special tissues involved in the growth of parts, and thus prepares the way for minute treatment of the many systems in the plant. These systems he presents under the following heads: (1) Dermal, all exterior parts, which are protective; (2) Mechanical, including all contrivances for imparting stability and strength; (3) Absorbing, comprising the avenues for procuring income; (4) Photosynthetic, comprehending the apparatus for utilizing the influence of light upon the manufacture of organic matter; (5) Conducting, for effecting transfer of raw materials and of elaborated products; (6) Storage, the treasuries of food and the like; (7) Aerating and ventilating, for promoting the entrance and movements of gases; (8) Secretory and excretory, embracing the glands and certain reservoirs; (9) Motor, effecting the transfer of the whole plant or of its parts; (10) Sensory, under which the movements of plants in response to stimuli are treated; (11) Stimulus-transmitting, the system by which a stimulus is made active at a point remote from its origin. There is not one of these systems which does not possess attractiveness, when considered in connection with its activities. Even the general reader will find it well worth his while to examine the text even if he is obliged to search for definitions of the many technical terms. In the chapter devoted to the dermal system he will come upon a host of interesting adaptations by which plants are enabled to resist untoward influences, especially of drought, and he will find also a fascinating account of certain means by which some plants defend themselves against their animal foes. And here fresh information is presented. For instance, we are told that the irritant substance which is characteristic of the stinging hair of the nettle is not formic acid, as is generally supposed, but is an albuminoid substance, held in solution in the cell-sap, and in many respects resembling an enzyme (an unorganized "ferment"). This discovery opens up a new chapter in organic poisons. Another very interesting subject here considered is the healing of wounds and the regeneration of tissues after injury. In one case cited, the regenerated outer covering reproduces even the breathing-pores of the normal layer.

The chapter in which mechanical adaptations are discussed is not so exhaustive, of course, as the special treatise by Schwendener, but every engineer will see in it numerous examples of adaptation in plants which satisfy all demands for economy of material. Strength is obtained with the least expenditure of material, and many of the instances can be best described in the language of mechanical engineering. Besides these illustrations of adaptations to obtain stability, there are given in this chapter certain cases of structures for climbing and fixation, which are partly novel, and all of which are interesting. Among the curious hairs which play a secondary rôle may be mentioned the "eel-trap" sort, by which the intruding insect is not only prevented from passing beyond a certain point, but is there securely entrapped and held.

As might be expected, the absorbing system in plants presents many interesting examples of adaptation. The water-absorbing hairs of certain foliage leaves are especially fitted to appropriate the dews which fall at night in the great deserts. The author holds that absorption of water takes place through these hairs, and never under normal conditions through the stomata (breathing-pores). In striking instances, the absorbing hairs form a felted surface on both sides of the leaves. But it is only those hairs which can be easily wetted which are capable of appropriating water.

The absorption of organic matter from decomposing substances and from living organisms is a topic which carries the author through a vast group of plants, in which the mechanism varies extremely, but is always characterized by efficiency. And he devotes attention also to the curious relation of the embryo in the higher plants to the food-materials stored within reach, which the embryo must take in the same manner as the plants just mentioned. This range of adaptations is surprisingly extensive.

In the chapter devoted to the relations of plants to light, and its action in the production of organic matter, the author has brought within a narrow compass the extraordinary story of some of the most remarkable adaptations in all nature. The shapes and arrangement of the cells constituting the apparatus by which all the food on the earth is directly or indirectly produced, are well described, and the maximum exposure of the working parts to light is clearly shown. The devices by which the manufactured products are taken away from the constructive machinery, and thus all clogging is prevented, are referred to in so plain a way that any intelligent observer can verify the principal statements by examining our common plants. The conducting system brings up certain puzzling questions which the author states fairly and explains as well as is possible in the present state of the science; but it is surprising that so many of these questions remain almost unanswered. The storage and ventilating systems are far better understood, and the account of these will be found very satisfactory. All the adaptations are interesting, and form, when taken by themselves, a fascinating chapter in the life-history of plants. The author has dealt as fully with the secretory and excretory systems as the ascertained facts warrant, but he is obliged to leave without answer a good many queries which naturally arise. Of course, he dwells upon the protective and attractive features of the side-products, but he confines himself to the vegetative organs, and leaves out of treatment the matters of floral perfume and color. The relations of the flower are not regarded to any extent in the present treatise: it is confined to the vegetative organs alone, except as relates to the movements of certain parts of the flower, and the dissemination of certain seeds and fruits.

Professor Haberlandt's study of the sensory system brings out a good many startling facts, particularly with reference to the profound influence which certain solid contents of the cell, in definite cases, have upon the power of motion. The author describes clearly and without any exaggeration the so-called optical-sense organs of foliage leaves. All of this will be found by even the most casual reader of profound interest. The translator's use of the words "flying-hairs and flying-tissues," to denote the appendages by which certain separated parts of the plant are aided in flight by the winds, is perhaps justifiable, but it is a trifle misleading. However, it is difficult to find better terms for these mechanisms. The author has a supplementary chapter on anatomy, in which he discusses secondary growths and the like, and this chapter closes the work. Without copious extracts from the pages, it is impossible to convey any idea of the attractive treatment of this fascinating subject.

Prof. Thomas Hunt Morgan has succeeded in presenting the difficult subjects which he treats in "Heredity and Sex" (Columbia University Press; $1.75 net) in a way that will command the gratitude of the specialist, and, at the same time, will be intelligible, or almost intelligible, to the general reader. The latter individual may miss the significance of many of the details, and probably will be confused by the complexity of some of the diagrams in which the book abounds, but he can hardly fail to grasp the main facts, for the author has the gift of presentation and a sprightly, attractive style. Probably every intelligent person has given some thought at times to the question of sex, and has wondered regarding the conditions that determine whether any given being becomes a male or a female of the species. Hypotheses by scientific men have been numerous, and, for the most part, worthless, and it is a matter for congratulation that at last a proximate solution of the problem has been furnished mainly by American zoölogists. Morgan gives in this book a clear account of the internal mechanism in the egg and the sperm-cell through which the sex of the fertilized ovum is determined, and applies this mechanism in the light of the Mendelian principles of heredity to the explanation of the inheritance of so-called sex-limited or, rather, sex-linked characteristics, such as color-blindness and hemophilia in man. In this latter application he is able to make much use of his own well-known and brilliant experiments upon fruit flies (Drosophila ampelophila). Variations that develop spontaneously in one sex of these animals he is able to transmit by suitable mating in a predictable manner to the male and female offspring. The accuracy with which those results may be obtained seems to justify the author's conclusion that "an internal mechanism exists by which sex is determined," and that the older theories, according to which sex is or may be conditioned by external conditions, must be abandoned.

Drama

THE DRAMA LEAGUE OF AMERICA.

The Drama League of America, now in its fifth year of activity, was founded for a definite purpose and has pursued it with such consistent and contagious vigor that its membership in the United States is more than a hundred thousand persons, and much praiseworthy work of a constructive character has been accomplished. That membership, composed not only of individuals who join as such, but also of schools, colleges, libraries, and clubs innumerable, is unified by certain ideas not hitherto held concerning the drama and the theatre in relation to the general life of the community.

This attitude on the part of the League towards the play and the playhouse involves, first, a belief that the drama in our time is fast becoming an appreciable and important part of literature, its representatives in the English-speaking lands and on the Continent now embracing many of the most distinguished writers of the day. After a generation of dominance, fiction is beginning to have a rival in this other form of story-telling, that of the stage. And because of this coming of the drama once more into serious regard—recalling in some measure those periods of the past when the chief literary glories of Spain, or France, or England were associated with the stage—the theatre becomes an institution to be reckoned with as a cultural opportunity. The Drama League, believing that a right use of the playhouse can minister to civilization, if only the amusement it offers be rational, sound, and of value as art and interpretation of life, is doing what it can by the emphasis of concerted action to encourage good plays, of all sorts and descriptions, only asking that they make an appeal to intelligent theatre-goers.

And closely associated with the thought that the theatre can (and therefore should) be an asset in the national civilization, goes a democratic ideal, the League's contribution to social service, that shibboleth of our time. The theatre, in nature and origin, is a great people's institution, a kind of forum of the emotions of mankind. It is the most widely appealing and influential of all the forms of story-telling, and of amusements; its democracy inheres in these facts. Hence, anything done to make it clean, artistically attractive, mentally and emotionally stimulating in the best sense, is directly a service to the public which attends the various theatrical offerings in almost inconceivable hordes. Of the motion-picture houses alone, there are 22,000 in this country. Allowing an attendance of 1,000 a day to each house—which is a fair estimate—we see that 22,000,000 folk attend this kind of entertainment daily in the United States.

Already it is beginning to dawn on the thoughtful few, at least, that with an institution so influential as this, so capable of popular instruction, it may perhaps be wise for city or State to have a hand in controlling or directing such an amusement; or, in lieu of such action, for enlightened individuals consciously to band themselves together in the way of assistance. The late William T. Stead, who was of strict non-conformist stock, never entered a theatre until he was well past fifty. After witnessing his first performance, he declared in an article in his magazine that the theatre should be supported by the people through taxation. Coming freshly to the problem, realizing what the drama could do, he saw the matter in its true significance as the jaded habitué could not.

With these ideas underlying its organization, the League devotes its attention to the play-goer because of the firm conviction that if he be trained gradually to know and demand good plays, the plays will be forthcoming. Desirous to help all concerned—players, playwrights, and managers, as well as the theatre-going public—it puts its central work, as I said, upon the auditor, believing that he can in turn affect all the others: is, indeed, the one great ultimate tribunal in the welfare of the drama. And in so far as it can, the League would wish to diminish the ignorant majority and increase the numbers of that honorable minority which is responsible to the things of the mind and the spirit when offered in the shape of a stage play.

To bring about these results, the League has elected a programme that it has steadily prosecuted. One thing it has refused to do: it indulges in no censure or attack upon bad drama; plays that are silly, negligible, or vicious it damns only by silence, preferring to draw attention to drama that is good. This is done primarily by the bulletin system, inaugurated in Chicago, the mother city of the movement, and now in familiar use in many of the thirty-six large cities where branches have been established. A play-going committee selects from the offerings of a given week the drama it deems most worth while, and a bulletin, giving succinctly the facts about the play and urging its patronage, is sent out to all local members—in cities like New York and Chicago amounting to many thousands. This bulletin, emanating from one of the centres, goes also to numerous suburban members. So successful has this plan been in operation that the manager of the bulletined play regularly assumes the expense of this circularization, which, for example, in the Chicago branch, amounts to about $160—a practical proof that he regards it as good advertising.

Of late, the League has undertaken, as a natural development of the bulletin idea in cities, to arrange for the support of a play which is regarded as worth helping and is about to be tried in the smaller towns. By the advance work of representatives of the League in such towns a guarantee is secured, so that the drama is seen in a circuit of towns which otherwise would have no chance of witnessing plays of that calibre, owing to the skepticism of the local manager, or the Laodicean attitude of the local public itself. This attempt to stimulate audiences in the smaller communities was sufficiently encouraging in the Middle West last season to suggest a promising field for the future in an important part of the League's work. Such an organization as the Irish Players, for example, was brought to a number of small towns by this League guarantee. As Mr. Winthrop Ames said at the fourth annual convention last spring, the problem of the small town and the "one-night stand" is more difficult than the city problem. The question whether any drama has actually been tided over probable failure by League support can be answered by citing Mr. Parker's "Disraeli," which was saved for a long and prosperous career by the prompt action of the Chicago branch when the play opened in that city.

Another activity in which the League has done much has to do with publication. It finances and conducts a quarterly, the *Drama*, devoted to the best interests of play and playhouse, and a special feature is the printing in each number of a complete play in English, whether translated or native, not before available in print. The so-called Drama League series of plays, published by Doubleday, Page & Co., in which eight volumes have appeared and which presents, in agreeable form and at a fraction of the price hitherto charged, representative drama, American, British, or foreign, is another enterprise. A series of study schemes and special pamphlets of great usefulness to individuals and for club courses are being issued at intervals, and a dozen or more can now be obtained. They are prepared by specialists, and the demand for them, coming from all parts of the country, runs into many thousands. Of peculiar value is the list of all books concerning the drama and the theatre; together with a list of all plays printed in English, whether native or foreign, compiled by Mr. Frank Choteau Brown, it meets a want not before supplied by any publication with such intelligent thoroughness.

The League, again, has a vigorous juvenile department, in which much specialized work has been done with the school children, one striking result of which was the Shakespeare Festival several years ago in Chicago, where thousands of the little ones enacted the master's plays on his birthday in April in the parks and open places of the city. Similar festivals have been given in New York and other cities. Splendid work has been done in the interests of the child in the playhouses in New York and Washington, sympathetically related in purpose, though not under League auspices. Let it be added that, as the movement has so rapidly grown, much fine work has been accomplished by societies affiliated or independent. The important thing is that all should work together and realize the advantage in the way of impressiveness and associated action of a large central organization.

These are a few of the main phases of the activity of the Drama League. Other ways of work will be undertaken in the future, many have been proposed, some

chosen as practical and wise. All who would care to have a comprehensive statement of what the League is doing, has done, and hopes to do, can be recommended to the admirable pamphlet by Mrs. A. Starr Best, the former president of the League, in which she reviews the first three years of its life. Of great value, too, is the report of the Fourth Annual Convention in Philadelphia last April. Both these publications can be obtained from the League's headquarters, 736 Marquette Building, Chicago.

If our Little Theatres and New Theatres, and especially endowed repertory companies, represent the aristocratic tendency in the drama (a very good tendency, too, rightly understood), the Drama League represents the democratic ideal, to give people at large opportunity to witness drama that, while it amuses, also enlarges the mental horizon, and which is sound art, but at the same time does not neglect its mission as good recreation. To quote Matthew Arnold: "The theatre is irresistible. Organize the theatre."

Richard Burton,
President of the Drama League of America.

"TWELFTH NIGHT."

"The evil that men do lives after them, the good is oft interred with their bones." These words of Shakespeare might be a fitting epitaph for many of the actor-managers who, since the days of Charles Kean, have sought to veil histrionic incapacity in a glare of spectacular glory. In the last century there has been an enormous development of the mechanical and decorative resources of the theatre, which has been accompanied, in the poetic drama at any rate, by an increasing irreverence for the text and, naturally enough, by a steady decadence in the art of acting. It is not necessary now to revive the old dispute whether or not the Elizabethan play is best presented in Elizabethan fashion, but it is obvious that where the play, and not its adornment, is the thing, the histrionic possibilities of the text become the vital object. To scenery, in the abstract, in the Elizabethan drama, there can be no valid objection. The Elizabethans themselves made such use of it as lay within their power. And it is clear that the scenery, when employed, should be of the best kind, appropriate, fit, and illusive, but, from the literary and artistic point of view, it becomes an unmitigated evil whenever it is permitted to dominate the play, or is made an excuse for mangling the text, and unduly modifying the action. The form of a classic drama is one of its essential characteristics. Any attempt to express it in modern terms is utterly unjustifiable. Not only is it inartistic, it is offering goods under false pretences.

Shakespeare has triumphed in the theatre in spite of all misrepresentation by poor players and pretentious charlatans. Among modern managers few have used him more disrespectfully than Sir Herbert Tree. An actor of moderate abilities except in eccentric comedy or melodrama, he has, in the great Shakespearean parts which he has assumed by virtue of his managerial prerogative, consistently offered gorgeous panorama as a recompense for histrionic deficiencies. And he has never hesitated—on purely artistic grounds, of course—to sacrifice the text to the exigencies of his spectacle. One of the latest specimens of his handiwork is the version of "Twelfth Night"—arranged in three acts instead of five as in the original—now to be seen in the Liberty Theatre. It is true that considerable ingenuity has been displayed in this remodelling. All the characters and essential incidents and a fair proportion of the lines are preserved, but localities are changed and scenes transposed to the great confusion and detriment of the action and the destruction of sequence. Personages come and go, as required, without reference to trifles like time or space, or such attention as Shakespeare paid to these details.

The task of designing the scenery to fit this arbitrary rearrangement has been entrusted to Joseph Urban, a prominent representative of the modern school of scene-painting, and it may be admitted readily that his sets are imaginative, rich in color, and pictorially effective. That they are peculiarly appropriate, or helpful, to the dramatic theme may be seriously questioned. Certain anomalies in them such as the flight of stone steps on the wild Illyrian beach, the impressionistic treatment of foliage and flowers, and some puzzling stone archways—neither promote illusion nor supplement the action. But allowance must be made, in common fairness, for the difficulties imposed upon the artist by the prescribed conditions. He has furnished handsome, spacious, and complete pictures, in which the ordinary absurdities of stage perspective are skilfully avoided. It is not altogether his fault if they are not always suitable to the occasion. The true responsibility rests with the London manager who hoped that an uninspired Malvolio might seem illuminated in the reflected brilliancy of his surroundings.

As a matter of fact the representation at the Liberty suffered more than it profited by the luxuriance of its environment. Yet it was, on the whole, taking all existing circumstances into consideration, meritorious. It was smooth, lively, and generally intelligent, though lacking in poetic and romantic atmosphere and the true flavor of the alternately quaint and robust Shakespearean humor. The Viola of Phyllis Neilson-Terry was an attractive but most uneven performance. This young actress, daughter of Edward Terry and Julia Neilson, scion of an old and illustrious theatrical family, comes with the prestige of London popularity and has been the subject of much perfervid journalistic praise. She is of a rare feminine type, tall, fair, slim, graceful, and charged with an electric vitality. Her face is bright with intelligence and girlish charm. Potent in personality, and evidently gifted with quick dramatic instinct, she is as yet in no sense a great or finished actress. Of Shakespeare's Viola she offers only rare glimpses. She comes nearest to that exquisite conception in her early scenes with Orsino, wherein, with fine natural intuition, she indicates her secret love and self-sacrificing devotion, with considerable subtlety and pretty maidenly shyness. But her passion is not very deep or moving at any time, while curiously intermittent. For the most part she is far too impulsive, restless, and volatile, betraying an animation and an exuberance of animal spirits which are gravely inconsistent with a state of tender melancholy. But she plays her scenes with Olivia with delightful archness and pleads her lord's cause with eloquent sincerity. Her assumption of the masculine air and swagger is excellent—in many ways she seems to be more suited to Rosalind than Viola—but in the duel with Aguecheek she abandons all pretence of virility and with it all the proper restraint of comedy. Here she follows the worst of bad precedents. The stupidity with which this scene is habitually mishandled is so crass as to be almost pathetic. As yet Miss Terry, who is very young, is a clever novice who obeys the promptings of impulse, not the laws of art. The best actor in the cast is Eben Plympton, whose Toby Belch is rightly conceived and firmly executed, only needing a little more liquorish unction to be wholly admirable. The Malvolio of Henry Dixey is capable and, but for occasional extravagance, sound. Other players do not require individual mention. But there is good stuff in them, and, if the forethought expended upon the scenery had been devoted to their instruction, the representation might have been thrice as satisfactory. J. R. T.

"THE GARDEN OF PARADISE."

Days approaching the Christmas season are an appropriate time in which to launch Mr. Edward Sheldon's dramatization of Hans Christian Andersen's story of "The Little Mermaid," which opened on Saturday at the Park Theatre. The sweetness and tenderness of this tale of the sea maiden who aspired to the love of a human king receive a particular sanction just now and can be looked at with a child's directness. Though, by the nature of the case, the spectacle gets perhaps more prominence than the drama proper—there being nine glowing scenes divided into three parts—Mr. Sheldon has succeeded in holding the dialogue strictly in accord with the original spirit of the story. In parts, indeed, the dramatic interest is asserted so well that one could wish that the author had had more room to himself. He shows the proper sort of imagination, which while pretty never becomes sophisticated and continues throughout to exhale the fairy presence upon which it essentially rests. In portions of the play, notably in the witch scenes and those in which the maiden, as page, ministers to the love of her lord, one sees the author striving for some of the exuberance of which Shakespeare in similar situations was master. But the imitation though conscious is never disagreeable. All things considered, Mr. Sheldon might well be content to exercise his talent in other fanciful pieces, instead of returning to the problem plays which have hitherto attracted him.

The cast was chosen with an eye to daintiness of effect. There were sweet girlish figures in abundance, and in the principal part Miss Emily Stevens was truly effective. The range of the part is of course not great, but she at least put the audience in sympathy with her pathetic ambitions, and those not familiar with the story were evidently much concerned, when her sojourn on land was drawing to an end, for fear that she would be forced to become a drudge of the witch who had helped her to human form.

Mr. Joseph Urban was responsible for the scene-painting, which, when the difficulties are considered, showed no little magnificence. The device of supporting wires unfortunately prevented an accurate simulation of swimming in the scenes under the sea, but this was an insurmountable difficulty. In other respects, truth to life, or rather to faëry, was well cared for. F.

THE PRINCESS THEATRE.

Three very short plays and a miniature drama in four scenes with an ambitious setting make up the new programme at the theatre devoted to "thrills and laughter." The laughter was supplied in generous measure by George Ade's "Nettie," a mordant little skit of life not more than two minutes from Broadway, developing an idea that is far from new, but doing it with the characteristic satirical flip of Mr. Ade's humor. One is especially grateful for a certain quality of imagination or atmosphere in this little play. Mr. Ade resisted the temptation of effects that are called suggestive because they are really very obvious. But to have avoided coarseness would be only a negative merit. Mr. Ade has succeeded in imparting a universal quality to his easy lines and familiar types, so that it is precisely this inconsequential little play, out of the entire programme, which comes closest home to the spectator.

Imagination is the quality lacking in the other three plays. They strive for horror and the thrill in the most obvious way. In J. B. Larrie's "The Denial" the scene is the death house at Sing Sing just before an execution. The idea is not a bad one. The ruffian who is about to meet his just fate denies his identity to his own mother and sends her away consoled in the belief that her son was only the victim of the murder for which the penalty is about to be paid. But the characterization, the emotional situations, and the language are utterly commonplace and fatal to illusion of any kind. Whatever effects are obtained are merely the mechanical response to the exhibition of the machinery of death by order of the State.

A far better bit of work is Frederick Truesdell's "The Fog." It has plot, situation, suspense, even thrill and horror. A murder is performed before the eyes of the spectators. But once more there are effects by obvious means. The nerves are rasped rather than thrilled. Of the subtlety that creates the higher horror, there is little suggestion either in the development of the story or the dialogue.

"Across the Border," by Beulah Marie Dix, is a dramatization of the horrors of war with very obvious reference to things of the moment. The author's sincerity is unmistakable. The method employed is the now familiar dream effect. Between the opening scene in a beleaguered field outpost and the last scene in a field hospital we have two scenes "across the border," in a vaguely defined half-station between the present life and the Ultimate. The horrors and folly of war are elaborated with detail, but with no suggestion of original thought and in language that is particularly commonplace in the mouths of the mystic figures that inhabit the superterrestrial scenes. There is also a great deal of repetition. More effective than the spoken sermon are the scenes of pain in the field hospital; it is again a rasping of the nerves rather than a stimulation of the higher emotions, but it is effective nevertheless.

Of the players, Mr. Powell did exceptionally well in the principal rôle in "Across the Border," handicapped though he was by his commonplace lines. Mr. Holbrook Blinn, who appeared in three rôles, was best as the old rounder in George Ade's play. Mr. Edgard showed versatility in two such different rôles as the gilded youth of Broadway and the blasphemous Tommy of the hospital. S. S.

Music

A LOST ART.

One of the rare pleasures in Rome, not enjoyed by many tourists, is to attend mass or vespers at Sant' Anselmo, the chapel of the international congregation of Benedictines on the Aventine. Services are held at hours discouraging to the tourist, too soon after a hotel luncheon, and much too soon after a hotel breakfast, but if he will conform his moments to the event, take a long ride in the street-car, and climb the steeps of the Aventine, he will be amply repaid. He will hear the nearest approach on earth to celestial music, the pure Gregorian song, after which even the service in a French cathedral seems but an echo, while the tunes in most of our churches become tawdry and profane. The next step is to buy the *Liber Usualis Missæ* and the *Liber Antiphonarius pro Vesperis*, edited authoritatively by the monks of Solesmes, to accustom one's self to square and rhomboid notes, to *virga* and *punctum*, *flexa* and *quilisma*, and thus to follow the ritual with an ever-deepening relish. Then the liturgical manuscripts displayed in many a library abroad exert a new fascination. One notices at first the general similarity between the notation employed in the authoritative editions, and that in the splendid service-books of the fifteenth century. Then interesting differences appear. If older manuscripts are consulted, these differences become more and more pronounced; the clear, square forms of the later Middle Ages dwindle into dots and dashes and curves, stenographic and mysterious. What is the history of these signs, and did anybody ever understand them?

The science of musical palæography is not half a century old. Excluding a few isolated attempts to penetrate that *selva oscura*, we must give chief credit to the patient monks of Solesmes, who, since 1880, have written learned treatises, published facsimiles of manuscripts in their monumental "Paléographie Musicale," and edited a number of service-books containing both the Roman rite and the rites of different monastic orders. There now appears, in the series of reproductions of manuscripts issued by the Vatican Library, a remarkable work entitled "Monumenti Vaticani di Paleografia Musicale." The author is the Rev. Henry Marriott Bannister, a priest of the English Church and an eminent authority on liturgics. Mr. Bannister has registered and described every manuscript in the Vatican that bears the faintest trace of a musical note. There are most careful descriptions of more than a thousand manuscripts, and excellent reproductions of more than two hundred of these. A scholarly introduction treats of the history of musical notation in the Middle Ages, and the forms and uses of the notes or neums. The forms of neums are set forth in special plates; two thousand varieties are presented, not in drawings, but by a difficult process skilfully executed, in photographs. There are also elaborate indices. The author informs us that his concern is with palæography rather than music, and he discreetly avoids matters of controversy in the latter subject.* For all that, his work is indispensable for the historian of music. It is the most important systematic and comprehensive treatment of musical notation in the Middle Ages that has yet appeared.

Neums probably developed, the musician may be indignant to know, from the accents of Greek grammar. The acute accent, called *virga*, represented a note higher than the preceding, the grave a note lower. This latter sign, which originally, like the Greek accent, was a line slanting downwards from left to right, was gradually reduced in length, eventually became a point, and hence is known as *punctum*. Its history is suggested in the diamond-shaped note which appears in the later square notation and which is simply the extremity of an oblique line. The circumflex denoted a high pitch succeeded by one lower. Both from the early forms of the note, ˊ and ˆ which represent an acute accent followed by a grave, and from its name *flexa*, we can trace its origin, not apparent in the modern symbol ♫, more nearly suggested in the square notation by ⁋ and obvious enough in the succession of forms presented in Mr. Bannister's plates.

From the two simple original elements and their modifications are developed by combination a variety of other forms. The *flexa* is one. Its opposite, the *pes*, represents a low succeeded by a higher note. The original form ✓ which is simply the union of the two accents, is often replaced by ✓. Sometimes also the top of the *virga* was adorned with a little cap, as in ✓ or ✓ from which form there easily grew the familiar sign of the square notation ⁖. There also developed a notation by points alone, whereby ⁘ would represent the *pes*. More complicated is the ascending run of three notes, *scandicus*, the descending run *climacus*, and what looks like a more elaborate variety of the former, *quilisma*. Then there are "liquescent" forms, which indicate the half vowel noticeable when a closed syllable ending in a liquid is carefully pronounced, as in *summus*, *il-lumina*. Since these liquescent forms occur in English manuscripts down into the fifteenth century, we may infer that the sloppy manner of pronouncing syllables to which we and our English cousins are addicted was not always in vogue in the British Isles.

An inspection of Mr. Bannister's plates is as interesting as a visit to a zoölogical museum. One can readily distinguish the different specimens, in which national characteristics are revealed as clearly as in architecture and script and personal appearance. French neums are fine and graceful, Italian are firm and clear; German neums, says Mr. Bannister, have a tendency to hori-

*He is not responsible, I am bound to say, for several categorical statements in the present paper.

zontal rather than vertical enlargement, and ultimately develop a coarse variety known technically as "hob-nail." The classes once distinguished, we become interested in the growth of musical notation, seeing everywhere writ large, or small, the doctrine of evolution and the survival of the fittest. Consider the stroke, which originally denoted the very essence of the *virga*. After the pitch of the note was indicated by the position of the point on the staff, the stroke either served merely to connect or became an ignominious tail. In the modern method it regains something of its importance, for it bears the bars or flags which denote length. But its rank is reduced, none the less. The whole note, the most dignified of all, never permits its company. The point was the form destined, as the fittest, to survive, into which the original strokes of both accents were ultimately metamorphosed.

We query next how exactly pitch could be represented, seeing that the staff with four or more lines does not appear until the end of the twelfth century. The invention of a single line is sometimes attributed to Guido d'Arezzo about 1033, but there is evidence of its use a century before his time. Guido's innovation, and it was an important one, consisted in the addition of a second line. He used red for the *F* and yellow for the *C* line, made musical instruction far easier than before, and paved the way for the more elaborate staff of the later period. But we must observe, further, that though there is no actual evidence of lines before the tenth century, there are clear instances of diastematic notation, that is, the arrangement of notes at different heights, in the earliest known manuscripts. So obvious is this method in Italian books that Mr. Bannister thinks the scribes must have had in mind an imaginary line to guide them in transcribing, or actually drew a temporary one by snapping on the parchment a cord covered with dust. Although manuscripts with full musical notation are not found in great numbers before the tenth century, there is reason for suspecting that a careful system of arranging the notes at distinct intervals of pitch was an early Italian invention, and indeed may have been a feature of Pope Gregory's musical reforms.

At first, however, the teacher was more important than his chart. He would render the exact melody with the proper emphases. The singer learned from him and used the written notes merely as an aid to memory. The Gregorian chant, like the Homeric poems, was thus transmitted orally at first. The two centuries following its invention have left us no written records of its melodies, and only a few texts with neums have been found in manuscripts of the ninth century. The original notation may well have been rigorously diastematic, but the carelessness of scribes and the exigencies of writing the neums between narrow lines of text led to a frequent neglect of the proper intervals. Indeed, so frequent was this neglect that it became a method and flourished in certain places to the exclusion of the exact and original system. The latter is hailed as a welcome innovation by the monks of Corbie towards the end of the tenth century and gradually prevailed everywhere. By the twelfth century, Germany alone was clinging conscientiously to what perhaps seemed to its scribes the earlier way. Just so Bismarck patriotically defended as the *Nationalschrift* that species of debased Gothic cursive long since abandoned by the other countries of Europe. For Germany, whatever its improvements in the ethics of war, is palæographically cautious.

It is also a matter of debate whether duration of time can be expressed by neums. The monks of Solesmes declare emphatically that it cannot, but recent researches open large fields for conjecture on this subject. Particularly important evidence is found in an anonymous treatise on musical art in a Vatican manuscript of the eleventh century; the treatise itself, of course, may have been composed before that date. The author, after defining in a little catechism what *cantus* is, says explicitly:

> The elements composing the system derive their origin from pitch-accents and syllabic feet. The derivation from pitch-accents is shown in the use of acute and grave and circumflex. The derivation from syllabic feet is shown in the use of short and long.*

Here is a writer who has traced the neums to their accentual source, and who also declares that they deal with longs and shorts. He proceeds to expound his theory with careful detail and seeming coherence, and adds illustrative neums in the margin. The only trouble is to make out what he means. Is he, in the manner associated by the modern world with scholasticism, merely talking elaborate nonsense, or is it we who fail to understand good sense? Let us adopt the more courteous view. A closer examination of the neums suggests that their differing forms are not due to the idiosyncrasies of a scribe or a school, but denote differences in time. Thus the signs for long and short, — and ⏑, may appear in the composite neums. In the *pes*, for instance, the form ✓ may denote a long, low note succeeded by a short, high note, ✓ a short, low succeeded by a short, high, ✓ a short, low succeeded by a long, high. If this is so, many pleasing subtleties are possible in the elaborately composite forms.

This is why I have ventured in the title of this paper to refer to Gregorian music as a lost art, the splendor of which, like that of the mediæval stained glass, has vanished in our modern world. The invention of the square notation secured clearness and precision at the expense of many a delicate nuance. Mr. Bannister can show by examples in the manuscripts how various fine emphases indicated by the earlier neums disappear when the melody is done over into the square notation. With the enthusiasm which only an expert and a conservative can feel, he declares, "Vetus melius est." Let us hope that further investigation by him and others will throw more light upon this fascinating obscurity.

Meantime, one must wonder that the cordial encouragement given to Gregorian music by his Holiness the late Pope Pius X has produced so little effect. Fragments of Gregorian are admitted in Roman Catholic and other services, but flashy anthems and female quartets are also not unknown. One charm of the Gregorian chant is its antiquity. Like the words of the liturgy, with which it was intended to be indissolubly wedded, it carries the worshipper back along the centuries of an unbroken tradition. One of Mr. Bannister's plates gives the music of a Gradual found in a German manuscript of the tenth century, agreeing with that used in the Roman rite, but not known in Italian manuscripts earlier than the twelfth century. Did Italy borrow a German invention at that time? Hardly. Both records, as in numerous other cases presented by Mr. Bannister, derive from the same ultimate source, which, as research tends more and more clearly to show, may well have been the elaborate musical liturgy devised by Pope Gregory the Great.

But another charm of the Gregorian chant is its amazing variety. At first one may find that it all sounds alike, as great music generally does to the uninitiate, but soon the fine shadings appear. Certain melodies are constant, though variously rendered, and are greeted each time as old friends. But every Sunday and Feast Day has its appropriate offices with appropriate music for each. Uniformity in variety; that is the essence of great art everywhere, and that is the essence of Gregorian music. Its melodies sounded in their magnificent simplicity and pleasing complexity through the Middle Ages, and may not be wholly lost even today for him who has ears to hear.

E. K. Rand.

*Ortus quoque suus atque compositio ex accentibus toni et ex pedibus syllabarum ostenditur. Ex accentibus uero toni demonstratur in acuto et graui et circumflexo, ex pedibus denique syllabarum ostenditur in breui et longa.

Queen Alexandra and a large party occupied the royal box at Covent Garden when a performance was given in aid of the artistic profession. It resulted in a profit of nearly $7,500. The chief musical feature of the performance was the first stage performance in English of "Phœbus and Pan," by the German, Bach. An appropriate and inspiriting addition to the concert was the "Fanfare" written for the Delhi Durbar of 1903 by Sir Charles Stanford. It was played by the trumpeters of the First Life Guards, under Lieut. George Miller.

"That the public welcomes the distraction offered by music from the one momentous issue was proved by the enormous audience at Queen's Hall on the day on which the news of the fall of Antwerp came through," says the London *Musical Record*. "It is true that it was a Saturday, and that the programme contained that ever-potent attraction, the 'Peer Gynt' Suite; but the fact, for all that, was not without significance in showing the trend of opinion as regards the necessity of 'carrying on' as usual."

Finance

REOPENING THE STOCK EXCHANGE.

The opening of the New York Stock Exchange on Saturday ended the longest period of suspended trading in the history of the institution. In the panic of 1873 the Exchange closed its doors for ten consecutive days, an incident unparalleled until last summer; they have been closed on this present occasion during four consecutive months, lacking three days. On the day of Germany's ultimatum, July 31, following the example of the London Stock Exchange, practically every institution of the kind in the world which had not already suspended business simultaneously took such action. Business was tentatively resumed on the Stock Exchanges of Chicago, New Orleans, Cleveland, and Toledo on Monday of last week; it was resumed at Philadelphia and Washington on Monday, and at Pittsburgh on Wednesday. Neither at London nor at Paris has the Stock Exchange yet reopened; but Paris has fixed December 7 for resumption of cash transactions, and London is discussing similar action around the beginning of January.

This reopening of the exchanges, as every one is aware, does not mean resumption of trading on the basis of normal times. The transactions authorized by the New York Stock Exchange, which began on Saturday, were in bonds only; trading in stocks was forbidden. Furthermore, a "minimum price" had been fixed for every bond by the committee, below which no sales were to be permitted; that price ranging from the actual final price of July 30 (or a trifle higher in two or three bonds) to a level 7 points below the quotation of that day. The variations in these permitted minimum prices were governed chiefly by the course of prices in private transactions among banking houses and investors during the four past months. It is clearly understood that the question of altering or removing the arbitrary minimum (which has already been dispensed with, in the case of State and city bonds), and the question of re-admitting stocks to trading on the floor of the Exchange, will be determined by the outcome of the present tentative resumption. With a view to fixing its policy in these directions, the Stock Exchange committee has required that all sales of bonds for foreign account must be so designated.

The purpose of these cautious restrictions is plain enough. They amount to recognition that the causes which led to the closing of the Stock Exchange on July 31 may possibly be still in operation, and that the present more or less experimental trading will test the question. Primarily, the Stock Exchange was closed, at the end of July, because the anticipated outbreak of war was believed to insure such an outpour upon our market of European holdings of American securities, at any price obtainable, as would utterly demoralize values and precipitate panic in the money market, where such securities were pledged, in enormous quantities, as security for loans on the basis of previous prices. Such a sequel was prevented through the withdrawal by the Exchange of all facilities for selling stocks or bonds at any price. The obvious problem now is whether the impending foreign liquidation, interrupted by the closing of the exchanges on July 31, will be resumed at their reopening—wholly, or partially, or not at all—and if it were to continue, how far its influence would be offset or modified by other influences.

The argument that European liquidation would not be resumed, on anything like the scale of last July, is chiefly based on the facts that the markets of the world were then in outright panic; that nobody knew what would happen on the credit markets, with the intricate relations of the great international money centres suddenly broken off; that, on the face of things, insolvency threatened powerful European houses with extensive international engagements, and that therefore the realizing on their investment holdings, wherever possible, was a peremptory necessity—whereas none of these conditions now exists. Protective and remedial measures of the most extensive scope have been adopted, with the support of Government, on every market of the world.

At London particularly, through the exceptional facilities offered by the Bank of England, the credit crisis has been definitely averted, and, through that institution's enormous accumulations of gold, the position has been safeguarded for the duration of the war. While the motives for the prodigious European selling of our securities in July have to this extent been removed, our own country's capital available for investment has been accumulating in the four months' suspension of the market for securities. To-day, moreover, even the facilities of credit have been greatly enlarged, through the introduction of the new banking system.

On the other hand, there has been in progress, since the beginning of the war, an absorption of capital into war loans on an unprecedented scale. The accepted estimates of the cost of the present war, to all belligerents, run close to $50,000,000 daily, and sooner or later the enormous total amount thus expended must be drawn from European investment funds. Such a demand would naturally raise the price of investment capital the world over, and that movement would ordinarily be reflected in lower prices for investment securities already outstanding. This is the real problem which overhangs the market, in the present tentative resumption of Stock Exchange operations. It will not be solved immediately. The trading in bonds on Saturday was conducted, as a rule, at prices not only slightly above the "official minimum," but not very far from the closing quotations of July 30. But naturally the process of determining how far a restricted market of the present sort tests the real character of the investment situation will be slow. The three important offsetting facts to keep in mind are that prices of securities had already been heavily reduced before the Stock Exchange shut down, in anticipation of these very conditions; that the whole world had in a sense been hoarding its accruing capital during the year before the war began, and that the rate of interest at which the strongest belligerent states have been placing their war loans has not yet reached any very abnormal level.

Lord Bryce *has written to the editor of* **The Unpopular Review**

'Tis a long time since I have read anything so good in any review or magazine. . . . Almost too good for a serial.

. . . To my great satisfaction people here were beginning to appreciate and enjoy it when the storm burst upon us.

It is fresh, not hackneyed or conventional, and it is full of thinking, written not because something has to be said, but because the writers have something to say.

History and Biography

My Path Through Life By Lilli Lehmann.

Personal memoirs of one who is rightly called the greatest dramatic singer of her time, and is, as well, a brilliant woman and a shrewd musical critic.
500 *pages*, 50 *illustrations*, $3.50

France Herself Again By Abbe Ernest Dimnet.

A comparison between the France of 1870 and France of today. A brilliant study of regeneration. 400 *pages*. $2.50

Fremont and '49 By Frederick S. Dellenbaugh.

The story of a remarkable career and its relation to the exploration and development of our Western territory. 547 *pages*, 50 *illustrations*. $4.50

The Winning of the Far West; 1829-1867 By R. McN. McElroy.

The history of the regaining of Texas, the Mexican War, the Oregon Question, and of successive additions to the territory of the United States. *Illustrations and Maps*. $2.50

Travel and Description

Cathedrals and Cloisters of France

1. Northern France. 2. Isle de France.
3. Midland France. 4. Southern France.

By E. W. Rose and V. H. Francis.

By far the most comprehensive, accurate, and authoritative work on the subject. It would be impossible to find a more thorough, artistic, and readable series of books.
4 *Parts. Each in two volumes; over* 200 *illustrations. Each* $5.00

The Lower Amazon By Algot Lange.

A book for the scientist, the lover of adventure, the naturalist, and the business man. By the author of "In the Amazon Jungle." 109 *illustrations*, 6 *maps*. $2.50

Mountaineering and Exploration in the Selkirks

By Howard Palmer, F. R. G. S.

The author is the first one to have surveyed and photographed a large territory of the Selkirks. The superb pictures are a great addition to this important work.
219 *illustrations*. $5.00

Old Court Life in Spain By Frances M. Elliot.

A picturesque record of the romantic days of courtly Spain.
Two volumes, 56 *illustrations*. $5.00

Miscellaneous

Between the Old World and the New By Guglielmo Ferrero.

This book combines the qualities of a romance, a dialogue, a record of travel, and an analysis of certain philosophical and sociological problems. $2.50

Where No Fear Was By Arthur Christopher Benson.

"With his wonted insight and sure grasp on many of the vital truths . . . gives us a score of helpful, suggestive, and eminently readable chapters on the nature and uses of fear."—*The Dial*. $1.50

A Woman's Career By Myrtle Reed.

With her accustomed incisive humor, the author writes of certain hampering burdens which have been placed upon woman's activities and served as a barrier to her natural development. .75

Character Reading Through Analysis of the Features

By Gerald E. Fosbroke.

Only by a careful application of the rules laid down by the author can any trustworthy analysis of character be arrived at. The rules are fully and clearly stated, and are supplemented by a series of illustrations of exceptional value.
8*vo*. 56 *full-page illustrations*. $2.50

Etching: A Practical Treatise By Earl Reed.

To the student and amateur this book will serve as a complete practical guide and manual. To the lover of etchings it will afford a welcome and fascinating view of the inside of the workshop. *Royal* 8*vo. Illus. by the author*. $2.50

Treitschke: German Destiny and Policies.

Essays by Bismarck's friend and Bernhardi's teacher, with a life, by Hausrath.
12*mo*. $1.50

At All Booksellers

YOUR BOOK PLATE beautifully designed and engraved; $300.00 will give you the drawing, the steel plate, and 100 impressions. *Send 20 cents for a signed artist proof of my Craftsmanship.*

BRETT, 30 BROMFIELD STREET, BOSTON.

ORATIONS, ADDRESSES, DEBATES, ESSAYS, SERMONS, THESES, etc., prepared to order on given subjects. MSS. criticised, revised and typed. Markets suggested. Outlines furnished. 12 years' experience. Expert service. Miller's Literary Agency, 211 Reisinger Ave., Dayton, O.

Some New Books for Christmas

RECOLLECTIONS OF FULL YEARS By Mrs. William Howard Taft

Clever, good-humored reminiscences of official life and the inner side of official life, in the Philippines, at Washington, and in the White House, by the wife of one of our most distinguished Americans. The best book on the unofficial side of American public life that has appeared in years. *Illustrated. $3.50 net.*

THE UNKNOWN GUEST By Maurice Maeterlinck

The Unknown Guest within ourselves—that mysterious, vaguely realized stranger that is part of us, and which is sometimes termed the psychic self—has called forth this strangely beautiful and exquisitely worded book. *$1.50 net.*

THE MASON BEES By J. H. Fabre

If you fail to read this book by the wonderful old Frenchman who reveals scientific discoveries in the language of a prose poem, you will miss something new, something incomparable in modern literature. *$1.50 net.*

IMPERIAL GERMANY By Prince Bernhard von Bülow

There are all sorts of books about German statesmanship by people who are neither Germans nor statesmen. But here is a new, tremendously significant book on the subject by the man who was Chancellor of the German Empire from 1900 to 1909. *$1.50 net.*

GERMANY'S MADNESS By Dr. Emil Reich

A revelation by Prof. Reich, late of the University of Vienna, of the processes by which many Germans have come to the belief that it is Germany's destiny to rule the world. *$1.00 net.*

THE REAL KAISER An Impartial Sketch

A fair, not unfriendly description of the Kaiser by an Englishman who freely admits the virtues as well as the defects of the War Lord's many-sided character. *$1.00 net.*

THE CHARM OF IRELAND By Burton E. Stevenson

A chatty, intimate, and veracious account of a recent devious journey through Ireland which gives a clear picture of modern Ireland and the Irish. *With many illustrations. $2.50 net.*

THE TOURIST'S CALIFORNIA By Ruth Kedzie Wood

Somebody is going to California this year. Why not a comprehensive, well-arranged, accurate guide-book giving just the information that Somebody will want? *Illustrated. $1.25 net.*

BEAUTY FOR ASHES By Albion Fellows Bacon

Every one who wants to do a little good for the outside world but doesn't know how to begin ought to read these inspiring experiences of a sympathetic woman who began by calling on a poor neighbor and ended by cleaning up a State. *Illustrated. $1.50 net.*

THE PRINCE OF GRAUSTARK By George Barr McCutcheon

A delightful Prince; an American financier; a romance hindered by statecraft, finance, the perversity of lovers, etc., and a final triumphant solution. As good as "Graustark." *Illustrated by A. I. Keller. $1.35 net.*

THE WONDERFUL ROMANCE By Pierre de Coulevain

We want a book at this time to remind us that there is still much good in the world; that happiness may be hidden but cannot be lost. Here is such a book by the author of "On the Branch." *$1.35 net.*

SMALL SOULS By Louis Couperus

"Deserves at least the same amount of acclaim and recognition and anticipation of the remaining volumes that greeted the first translation of Romain Rolland's great masterpiece, 'Jean-Christophe.'"—*Chicago Evening Post. $1.35 net.*

THE GREATEST OF THESE By Archibald Marshall

A leisurely, mellow novel of English country society, with no thrills nor spasms, but as real as life. It's by the author of "Exton Manor" and other novels of unusual merit. *$1.35 net.*

THE JESSIE WILLCOX SMITH MOTHER GOOSE

You need not fear that this book will lack some of the jingles you used to love, and which you want some little one to know. This is the most complete "Mother Goose" published, containing 400 more rhymes than any other edition. And the big pictures in color by Jessie Willcox Smith are simply fascinating. *$2.50 net.*

Let us send you an illustrated Catalog, *just issued*, of all our New Books

VOL. XCIX.—NO. 2580 THURSDAY, DECEMBER 10, 1914 PRICE TEN CENTS

T. Coo Library Dec 31 1914

MR. H. G. WELLS'S NEW NOVEL

THE WIFE OF SIR ISAAC HARMAN By H. G. Wells

Author of "The Passionate Friends," "Marriage," etc.

"Mr. Wells is supremely the modern novelist. . . . He is not merely abreast of the times. . . . He has repeatedly shown himself uncannily able to keep in advance of the crest of the wave." A writer of brilliant parts, his latest novel is filled with wisdom and scintillates with wit. Sir Isaac, as a man, has in him the red blood of a vital character in fiction." $1.50

THE BEST NEW NOVELS BY PROMINENT AUTHORS

Jack London's New Novel
THE MUTINY OF THE ELSINORE
"Contains the real wildness and savor of the sea, the thrill of adventure, danger, conquest and immortal truth." Colored frontispiece. $1.35

BOOKS OF THE WEEK 699

The Harvard Health Talks

give in brief and easily intelligible form the best information on the subjects which the modern medical world has to give. Each topic is one of every-day importance, and is treated by an authority chosen by the Harvard Medical School. The volumes are bound in cloth, with lettering in gold, and are sold at fifty cents net.

Vol. I. THE CARE OF CHILDREN. *Dr. J. L. Morse.*
Vol. II. PRESERVATIVES AND OTHER CHEMICALS IN FOODS; THEIR USE AND ABUSE. *Prof. Otto Folin.*
Vol. III. THE CARE OF THE SKIN. *Dr. C. J. White.*
Vol. IV. THE CARE OF THE SICK ROOM. *Dr. E. G. Cutler.*

LONGMANS' NEW PUBLICATIONS

THE TRAINING OF A SOVEREIGN

An Abridged Selection from "The Girlhood of Queen Victoria." Being Her Majesty's Diaries Between the Years 1832-1840. Published by Authority of His Majesty the King. Edited, with an Introduction, by VISCOUNT ESHER, G.C.B., G.C.V.O. *New and cheaper edition in one volume.* With 7 Illustrations. Square 8vo. $1.50 net.

ALIENS

By WILLIAM McFEE, Author of "An Ocean Tramp." Crown 8vo. $1.35 net.

"It is a well-written and entertaining story, that will surprise the seasoned novel reader again and again."—*N. Y. Sun.*

THE BOOK OF THE BLUE SEA

By HENRY NEWBOLT. With 8 Colored Plates and numerous Illustrations in Black and White by NORMAN WILKINSON. Crown 8vo. Gilt top. $1.50 net.

These stories are not fiction, but pictures of real naval life in the days of Farragut and Nelson as seen through the eyes of boys, each one of them a record of a boy's career from the moment of his first going to sea.

THE WOOD PEOPLE: AND OTHERS

By MAUD D. HAVILAND. With 12 Illustrations by HARRY ROUNTREE. Crown 8vo. $1.40 net.

The author describes in story form episodes in the life-history of various birds and beasts, and reveals not only an exact knowledge of natural history, but also a sympathetic understanding of the feelings and motives of animals. Miss Haviland seems to see the drama of animal life, its pathos and tragedy, and does not try to endow them with "super" animal or semi-human qualities.

THE PAN-ANGLES:

A Consideration of the Federation of the Seven English-Speaking Nations. By SINCLAIR KENNEDY. With a Map. 8vo. $1.75 net.

"The book was printed before the European war was upon us. Its arguments are the more cogent in being unbiassed by the object lesson with which they are now strengthened.

"No preconceived objections should stand in the way of a careful reading of the book. It is worthy of the respectful attention of every American citizen, and of every man of the English speech with our common heritage of civilization."—*Boston Herald.*

THE CITY OF UNDER

By EVELYNE RYND, Author of "Mrs. Green," "Otherland," etc. Crown 8vo. $1.35 net.

"A delightfully quaint story, full of interesting impressionism."—*Liverpool Courier.*

MENTALLY DEFECTIVE CHILDREN

By ALFRED BINET and TH. SIMON, M. D. Authorized Translation by W. B. DRUMMOND, Author of "An Introduction to Child Study," etc. With an Appendix containing the Binet-Simon Tests of Intelligence by MARGARET DRUMMOND, M.A., and an Introduction by Professor ALEXANDER DARROCH. With 10 Diagrams. Crown 8vo. $1.00 net.

STORIES OF GREECE AND ROME

By HILDA JOHNSTONE, M.A., Reader in History in the University of London. With Illustrations by Dorothy Payne. Crown 8vo. $0.75 net.

Twelve stories from the Iliad, the Odyssey, the Æneid, and other sources of Greek and Roman legend told in a simple way.

Published by **Longmans, Green, & Co.** Fourth Ave. and 30th St. New York

INTERNATIONAL PERSPECTIVE IN CRITICISM:

Goethe, Grillparzer, Sainte-Beuve, Lowell

By GUSTAV POLLAK

"It is restorative of one's mental equilibrium to turn aside and linger in this temple of literary concord erected by Austrian, French, German, and American builders who in the higher brotherhood of men worshipped together."—*The Nation.*

JUST PUBLISHED

SWIFT'S GULLIVER'S TRAVELS

Edited by EDWARD K. ROBINSON

With illustrations by CHARLES COPELAND

12mo, cloth, 256 pages, 40 cents

THIS volume, which contains the voyages to Lilliput and Brobdingnag, is an unusually attractive edition of the classic. The text is based on a careful comparison of all the early editions of "Gulliver's Travels" in an effort to eliminate the inaccuracies and alterations which have crept into almost every modern edition.

By reason of the large number of full-page and text illustrations especially made by Charles Copeland for this edition, together with its clean and pleasing type page, this book should prove most acceptable for school, home, and library use.

SOME SCRIBNER BOOKS

Henry van Dyke in "THE GRAND CANYON AND OTHER POEMS" includes "The Peace Hymn of the Republic," "Texas," "Sierra Madre," "Heroes of the Titanic." The collection is characterized by those rare qualities that, as The Outlook has said, have enabled the author "to win the suffrage of the few as well as the applause of the many."

$1.25 net; postage extra.

Viscount Bryce has written an introduction and NICHOLAS MURRAY BUTLER a preface to "THE BRITISH EMPIRE AND THE UNITED STATES," by WILLIAM ARCHIBALD DUNNING. The book is a history of the relations of the countries during the last hundred years and explains the underlying causes of a century of peace.

$2.00 net; postage extra.

Theodore Roosevelt in "THROUGH THE BRAZILIAN WILDERNESS" gives the complete account of his adventures in South America, including his exploration of the famous River of Doubt, his hunting experiences, his scientific investigations, etc. Illustrated with photographs by Kermit Roosevelt and others.

$3.50 net; postage extra.

Richard Harding Davis writes of the Great War in "WITH THE ALLIES," a first-hand account of fighting at the front, of the bombardment of Rheims Cathedral, of the burning of Louvain and the author's thrilling experiences when captured as a spy. Profusely illustrated from photographs. $1.00 net; postage extra.

J. M. Barrie in "HALF HOURS" has included four of his most characteristic short plays, "Pantaloon," "The Twelve Pound Look," "Rosalind," "The Will." These are all very different, and all Barrie at his best.

$1.25 net; postage extra.

E. Alexander Powell was the only correspondent officially attached to the Belgian army. In "FIGHTING IN FLANDERS" he describes his experiences in the firing line throughout the campaign in Flanders and in every phase of the great drama culminating in the fall of Antwerp. Profusely illustrated from photographs. $1.00 net; postage extra.

Henry James in "NOTES ON NOVELISTS, WITH SOME OTHER NOTES," gives a penetrating analysis of the work not only of the fiction writers of the last century, but also of such present day novelists as Galsworthy, Edith Wharton, Hewlett, Wells, Bennett, etc.

$2.50 net; postage extra.

Winifred L. Taylor in "THE MAN BEHIND THE BARS" tells of the inner lives of convicts and of prison conditions in this country in a wonderfully readable way. The book is the result of long experience and sympathetic study, based on the assumption that the prisoner is primarily a human being.

$1.50 net; postage extra.

Mrs. R. L. Stevenson in her DIARY describes THE CRUISE OF THE JANET NICHOL among the South Sea Islands in 1890. The diary gives most fascinating glimpses of her husband and should be an inspiration to all lovers of Stevenson. Profusely illustrated.

$1.75 net; postage extra.

James Gallatin in his diary, "A GREAT PEACE MAKER," writes of the great men and women and events in France and England at the end of the Napoleonic era. James Gallatin was the son and secretary of Albert Gallatin and accompanied his father during the negotiation of the Treaty of Ghent. Illustrated.

$2.50 net; postage extra.

The Nation

NEW YORK, THURSDAY, DECEMBER 10, 1914.

Summary of the News

The past week has been an active one in the Parliaments of the world. Congress reassembled after its six weeks' recess on Monday, and the President read his address in person on the following day. The Reichstag met on December 2, and the Italian Parliament on December 3. On Monday the Japanese Diet also opened, and during the week it was announced that the French Chambers would reassemble at Paris on December 22. The Portuguese and the Servian Cabinets both resigned on December 5.

A considerable portion of his address to Congress President Wilson devoted to the subject of national defence, particularly in connection with the agitation recently started for an inquiry into the preparedness of the United States for war. With this question we deal elsewhere. For the rest, the legislative programme before the present Congress includes passage of the conservation bills, the bills for ultimate independence of the Philippines, ratification of the London convention for safety at sea, a Government-owned merchant marine, charting the perilous waters of the Alaskan coast, and measures for economy in all branches of the Government.

The most interesting political event of the week was the opening of the Italian Parliament, when the Premier, Signor Salandra, made a statement explaining the situation of Italy, defending the correctness of the course so far pursued, and recommending the maintenance of an attitude of loyal, but "watchful, and armed neutrality." A significant demonstration was made by the Extreme Left when Signor Salandra referred to "the just aspirations of Italy," the phrase being taken to apply to Italian ambitions for the recovery of Trent and Trieste, and another demonstration occurred when a member, before adjournment, proposed that the Chamber send greetings to "heroic and unfortunate Belgium." A vote of confidence in the Government was passed on December 5 by 413 to 49, the dissentients having chiefly expressed dissatisfaction with the military preparedness of the country. Replying to criticisms on this score, Signor Salandra declared that the Italian army and navy were "ready for any event."

A sensational episode in the debate was the reading by ex-Premier Giolitti of telegrams that had passed between himself and the late Marchese di San Giuliano in August last year, showing that Austria at that time had intended to make a declaration of war on Servia, and had consulted Italy as to what her position would be. This correspondence, to which we allude elsewhere, showed that the stand taken by Italy on that occasion was the same as the one adopted by her under present circumstances, a resolution to maintain neutrality, on the ground that no *casus fœderis* existed where one of her allies was the aggressive party. The correspondence also indicated that Italy, in that instance, made representations to Germany to induce her to prevent the contemplated action of Austria.

The general impression left by the debates in the Italian Chamber is that the Italian Government intends to hold loyally by its neutral attitude unless events should occur to force it into belligerency, and that, in adopting this position, it enjoys the overwhelming support of Parliament. At the same time, the tenor of the debate made it clearer than ever on which side Italian sympathies are ranged, and Signor Salandra's grave words concerning the military preparedness of the country and the sacrifices which might have to be borne are not without signficance. That Berlin appreciates the delicacy of the situation is sufficiently indicated by the official confirmation of the report that Prince von Bülow, ex-Chancellor of the German Empire, has been appointed to replace Herr von Flotow as Ambassador to the Quirinal during the latter's absence for three months, on account of ill health. The appointment is assumed to represent a strong effort on the part of Germany to prevent Italy from joining the Allies.

The German Reichstag, at its opening on December 2, voted a new war credit of 5,000,000,000 marks, there being only one dissentient, the Socialist, Dr. Karl Liebknecht. The Imperial Chancellor, Dr. von Bethmann-Hollweg, in addressing the Chamber, attributed the blame for the war to England, asserting that "the Cabinet at London could have made the war impossible if it had declared at St. Petersburg that England would not allow a Continental war to develop from the Austro-Servian conflict."

In the Balkans the situation remains unchanged. The position of Servia is obviously serious. Belgrade was taken by Austrian troops on December 2, and the Servian army, depleted by its recent losses and by those in its two previous wars, is presumably opposed by forces greatly superior in number. Nevertheless, since the evacuation of the capital, it appears to have made a stand. The danger spot for the cause of the Allies is still Bulgaria. According to reports, and to the probabilities of the situation, Turkey has a considerable body of troops concentrated at Adrianople, and awaits only the acquiescence of Bulgaria to dispatch these through her territory and into Servia. Thence they could be thrown into the fighting in western Europe. In favor of the realization of this plan is Bulgarian rancor towards Servia; against it is the general sympathy of Bulgaria for the Allied cause, and the attitude of Rumania, which appears to grow increasingly favorable to the Allies. It was reported from Athens on Monday, though not on unimpeachable authority, that progress had been made in the direction of an understanding among the Balkan states, and that a basis had been reached for a rapprochement between Bulgaria and Servia. In the meanwhile, Turkey formally proclaimed a "Holy War" against Servia on December 4.

The rebellion in South Africa, abortive from its inception, may presumably be said to have been definitely crushed by the capture of Gen. Christian de Wet on Tuesday of last week. De Wet, whose forces had been dispersed or had deserted him, and the score or so of followers who remained with him, after a long chase, surrendered without resistance at Waterburg, British Bechuanaland. His fate has not yet been decided. By the rules of warfare his life is forfeit, and some of the London press has clamored for his execution as a traitor. Judgment will be left to his South African compatriots, and one may perhaps be permitted to hope that they will find it in their hearts to temper justice with mercy in dealing with the old irreconcilable. Whatever the verdict, it will be a melancholy end for one who once caught the imagination of the world, of friend and foe alike.

A communication was issued on December 6 by the British Foreign Office relative to the attitude of Great Britain towards Belgian neutrality before the war. The communication consisted of the record of a conversation between the British Minister at Brussels and Sir Edward Grey, on April 7, 1913, wherein the former had stated that there was apprehension in Belgium that in case of war Great Britain might be the first to violate Belgian neutrality. Sir Edward Grey's reply was to deny that Great Britain contemplated taking such a course. "For us," he said in part, "to be the first to violate it [neutrality], and to send troops into Belgium would be to give Germany, for instance, justification for sending troops into Belgium . . . what we desired in the case of Belgium, as in that of other neutral countries, was that their neutrality should be respected, and, as long as it is not violated by any other Power, we should certainly not send troops ourselves into their territory."

Not much additional light has been thrown upon the situation in Mexico during the past week. Provisional President Gutierrez made his formal entry into Mexico City on December 3, escorted by the troops of Emiliano Zapata. Gen. Villa was already in the city, and according to dispatches from Mexico City published on Monday, he and Zapata are on the best of terms. At any rate, after a conference, they made public announcement that they would work together, and that each would retire into private life when their work was accomplished. It was also stated that an active campaign against the Carranzista forces would shortly be undertaken by Villa and Zapata acting in conjunction. The civil and military convention will meet next week in Mexico City to approve the proposed plan.

The deaths of the week include: Temple Bowdoin, Earl of Stair, the Rev. Addison Ballard, Henry William Banks Davis, December 2; Earl of Erne, Dr. Alexander Campbell Fraser, Charles P. Sainton, December 3; Congressman Edward A. Merritt, jr., John Chatterton (Signor Peruginl), Simon Towne Russell, December 4; Cardinal Angelo di Pietro, Capt. James Hillhouse Perry, U. S. N., Miss Agnes Irwin, December 5; Dr. Albert Charles Peale, December 6; Madison Julius Cawein, December 7.

The Week

When a history of the Great War as it affected the United States is written fifty years hence, the hysteria of the organizers of safety leagues to prevent our being invaded by the victors in the European struggle will doubtless afford one of the most entertaining chapters. Last week eloquent appeals were made to do something or other to forestall the unloading of 150,000 soldiers on our shores within a week or so after the declaration of war. There were visions of the conquest of Canada by the Germans, from which they would, of course, having disposed of the British and American fleets, calmly walk down the Hudson to Albany and New York. No nation could possibly land 100,000 men here, save after weeks and months of preparation. Probably only England, with her great sea-power, could accomplish this at all. It was shown by a prominent British writer in the war scare of 1909 that to move a force of 200,000 German soldiers to England, with all their guns, ammunition, horses, forage, transport wagons, and food supplies for three weeks, would take every ship in the German merchant marine, including all those in service in Asian and Australian waters, and that the speed of this impossible fleet could not be much over twelve miles an hour. What such an undertaking would be across 3,000 miles of water, any one can figure out from the weeks it took the Japanese to transport their army to Manchuria and for us to send a few thousand men to the Philippines.

In his speech at the opening of the Reichstag, the German Chancellor not only gets miles away from his famous confession of wrong in the violation of Belgium's neutrality, but gets out a brand-new view of the responsibility for the war. He puts the blame upon England, not in the usual way, but because she failed to declare to Russia that she would not allow her to bring on a Continental war in consequence of Austria's ultimatum to Servia. But if this is a valid argument against England—and in our judgment it is not—is it not precisely as just to ask the old question: Why did not the Kaiser notify his subservient ally that he would not permit a Continental war to arise out of her ultimatum to Servia? If there was any responsibility on England whatever to hold Russia in check, there was ten thousand times more responsibility upon Germany to prevent the original firing of the fatal train. The only point, it seems to us, where von Bethmann-Hollweg scores ever so slightly is in his parallel between England's concern for Belgian neutrality and her connivance at Japan's violation of Chinese neutrality.

Highly significant in the proceedings in the Reichstag was the solitary vote cast against the new war loan by Dr. Karl Liebknecht. For some time it has been plain that there was no such unity in Socialist ranks with regard to the war as would be indicated by the unanimous vote of that party in favor of the first war budget last August. Through the press the revolutionary wing of the German Social-Democracy, as represented by Karl Liebknecht, Franz Mehring, Rosa Luxemburg, and Clara Zetkin, have let it be known that they strongly disapprove of the active propaganda carried on in favor of the war and Germany's cause by Socialists like Scheidemann and Südekum. It has been brought out that, while the 110 Socialist votes were cast as a unit last August, this was the result of caucus action. Within the Socialist caucus there was a large faction opposed to voting for the budget. Last year similar caucus action dictated the Socialist vote in favor of the quarter-billion war contribution. Mr. W. E. Walling states in the *Outlook* that in the 1913 caucus there were 51 votes in favor of supporting the war loan and 37 against, so that an actual minority of the Socialist party representation of 110 dictated the party policy. It is now apparent that Dr. Liebknecht has broken with the party leadership and has made himself the spokesman of a discontent with the war which has always existed in Germany, and is now becoming articulate, even as it is becoming articulate among Socialists in England and in Russia.

"The Belgian Government," says M. Havenith, its Minister at Washington, 'has requested that these alleged documents should be published in full. Three months have passed since this alleged discovery, but nothing has appeared." What he refers to is, of course, the documents found in Brussels which the Germans assert are proof that Belgium had surrendered her neutrality to England. That they *do* show anything of the kind, there is not the faintest reason to believe; even according to the German account of their contents, all that the documents prove is that the Belgians had prepared, in consultation with English officers, a scheme of defence against German violation of their territory. Whether this was so or not, M. Havenith does not know; but, he says, "events have shown too clearly, alas! how much such a precaution against Germany's projects would have been timely." It ought to be remembered, in all this, that the plea made by Germany—last reiterated by the Imperial Chancellor in his speech a few days ago—is not only a plea in defence of Germany's conduct, but a charge against Belgium of disgraceful bad faith. To make such a charge without at least a respectable pretence of proving it is monstrous, and really but intensifies the feeling of Germany's guilt in the whole matter.

In the revelation by ex-Premier Giolitti that Austria in 1913 was proposing to make war on Servia, and asked Italy if she would stand by the Triple Alliance, there is great suggestiveness in several different ways. We see clearly, for example, that the assassination of the Archduke Ferdinand merely gave the Austrian Government a good excuse for proceeding with a war-like policy against Servia which it had long cherished. It is plain, too, that Italy was already studying carefully the nature of her obligations under the Triple Alliance. She was bound to join Austria and Germany only in case they—or either of them—were attacked. There could be no *casus fœderis* in a deliberate move of Austria against Servia. Italy's straightforward refusal to lend herself to the Austrian plans of 1913 should have been a sufficient notice to her allies that she could not be drawn into their schemes of 1914. The attitude of the Italian Government this year is, by the way, as good a proof as one could ask that Austria and Germany were not, as they alleged, beginning a "defensive" war. Italy located the aggression in Vienna and Berlin. Finally, in the light on the troubled year 1913 which is cast back by Giolitti's statement, we see how fully justified was the continued apprehension of financial Europe. It did not believe that the apparent settlement of the Balkan War meant assured peace; and we can now perceive that it was right.

The French Parliament is to meet in extraordinary session at Paris on the twenty-second. This is not tantamount to a return of the Government from Bordeaux. It is a sign, however, of growing hopefulness and undiminished determination on the part of the French nation. Though France may be justly regarded as the focus of the great conflict, we know less of what is going on in France than in any other of the combatant nations, not even excepting Russia. We have no way of judging the losses she has suffer-

ed, in the absence of casualty lists. Only hints come out as to the way the very important problem of dealing with the enormous number of refugees is being confronted. It is certain, of course, that France's losses have been very great and that her resources are being taxed to the utmost. But enough has come out to show also that the French are facing the situation with a pluck, a tight-lipped resolution, which is not usually associated with their national character.

Uninterrupted preparations for marking the centenary of the signing of the Treaty of Ghent show that the event will be observed with dignity. The war now sweeping Europe, far from diminishing the notice it will attract, gives it clearer relief. Could anything better emphasize the difference between the Canadian-American frontier, along whose 3,800 miles a celebration will be held in every city from Vancouver to the Atlantic, than the smoke and carnage on the Belgian and Polish frontiers? On the 24th of this month the feeling that peace is the greatest of public blessings cannot but be uppermost in every heart. It will not be possible for the appointed delegates to meet that day in Ghent, or for Belgium to take any part in the celebration; but the cataclysm abroad will not interrupt the ceremonies in London, Quebec, Montreal, and Ottawa, nor, we hope, any of those planned in this country. New York has voted $10,000, and the Governor has appointed a commission; Virginia has passed a law that the event shall be celebrated by the cessation at noon for five minutes of all traffic, labor, and business; Pennsylvania, the Carolinas, and other States have appointed official commissions; Louisiana is to hold a great celebration at New Orleans on the 8th, 9th, and 10th of next month. When we remember that the War of 1812 was connected with the Napoleonic conflicts, to which the present war offers a parallel, there is special point in calling to mind what Premier Borden of Canada calls "the excellent way these two great Powers have found and followed."

Treasury estimates of the expenses of Government during the next fiscal year, sent to Congress on Monday, carry with them a warning to the country that Washington must still be made to feel the necessity for economy. They have been drawn up under departmental injunctions to save on every possible head, and are hailed as expressing the general desire for retrenchment; yet their total of $1,090,775,134 is but $3,392,962 less than the appropriations for the current fiscal year, and about $17,500,000 less than the Treasury estimates for 1915. So recently as 1913 we were spending but $963,738,000, and in 1912 but $965,273,677. Attention will doubtless be centred on the rivers and harbors appropriations, for which an outlay of over $53,000,000 is recommended. Senator Ransdell and his associates have announced their purpose of fighting for at least $45,000,000, to be spent in the same wasteful way as formerly. Public sentiment in this matter is to-day unequivocal, and it is probable that attempts at "log-rolling" will only intensify the demand for minimum appropriations until some such body as the proposed Newlands Commission can be formed. There is promise that everywhere President Wilson will use his influence for economy—for genuine economy, that is, and not for the false economy that cuts into needed expenditures.

The Colonel must be delighted with his latest recruit. Senator Penrose gives his warmest approval to Mr. Roosevelt's violent assault upon the Mexican policy of President Wilson. The Pennsylvania Senator states that he has not been able to agree with Roosevelt in many positions, but that in this business the Colonel is a man after his own heart. The reason is plain. Political reforms and chatter about social justice only fill Penrose with disgust; but since many Pennsylvanians have "large interests" in Mexico, which might be enhanced in value if we were to seize Mexican territory, he is naturally for as vigorous and aggressive steps as any that the Colonel advocates. The significant event, however, is this getting together of Penrose and Roosevelt on the issue of intervention in Mexico. May we not soon see them locking arms under the banner of a thundering army and an invincible navy, and singing in lovely unison "Onward, Christian Soldiers"?

Gifford Pinchot's voice is still for war. Others may debate the desirability of going into the campaign of 1916, but he does not propose to "abandon the 270,000 voters who gave me their suffrages in the last election." In this respect he is different from most of his fellow-Progressive candidates, who found themselves abandoned by their quondam supporters. Nor can many candidates afford to go on spending fifty thousand dollars per campaign, as Mr. Pinchot confesses to having done. Penrose, as he says, doubtless spent more than that. These expenditures were in spite of the law limiting Senatorial candidates to ten thousand dollars for expenses, but as the law excepts "necessary personal expenses," which include travelling and printing, money is still able to talk loudly in a fight ostensibly at least between principles. There have been murmurings that the Progressive General Staff was too much of a millionaires' club; certainly, the party has failed to capture the labor vote, despite its social-justice slogan and the presence in its ranks of prominent social workers. But what could it hope to do without its Pinchots and its Perkinses? If only for the sake of the picturesque element they bring to our politics, one hopes that they will decide to keep the mimic war going a while longer.

A bulletin issued by the Census Bureau on the Chinese and Japanese in the United States supplies for the analysis of the yellow menace some wholly new figures regarding the agricultural situation. It appears that in 1910 the total number of farms operated by the Chinese was 760, and by the Japanese 2,502—the land in the Chinese farms totalling 52,041 acres, and that in the Japanese 157,259 acres. It is further stated that "only 57 of the Chinese farms and only 257 of the Japanese farms were operated by owners, the majority of the Chinese and Japanese engaged in agriculture being cash tenants." Figures of this same purport were made public by various authorities in 1912 and 1913, but the Federal Government has heretofore published only the total number of Chinese and Japanese farmers. As the Census Bureau states that these farms are scattered through eleven States, it is plain that the dangers of alien land-ownership are not great. The Bureau's figures on the marital condition of the two races also suggest that most of the land is held by single men, and that the amount of land whose tenure will be kept in Chinese or Japanese hands by inheritance might be limited by that fact. There are fourteen times as many Chinese men as women in the United States, seven times as many Japanese; and of the 72,000 Japanese in this country, considerably less than one-third the adults are married.

The New York *World's* statement of the case against Minister Sullivan in Santo Domingo is bound to raise anew the question of his fitness. It seems incredible that these details of the Minister's relationships could have been known and considered in the State Department, prior to the Minister's recent whitewashing. By this we do not mean to pass judgment upon the *World's* particular charges. We merely point out

again that the appointment of Mr. Sullivan, when competent, trained men of many years of service were being turned out of the diplomatic corps, was a wrong to the service and the grossest injustice to the Santo Domingans. Surely, we owed them something better than a press-agent for a prize-fighter and counsel for the notorious "Jack" Rose, a man all of whose associations and relationships in New York city stamp him as the last one who should be put into a position to represent the United States. There are plenty of men here a hundred-fold more competent and worthy, and it is much to be regretted that Mr. Bryan did not send a fit representative to deal with the extremely delicate situation in Santo Domingo.

Besides its opinion on the Jim Crow question, the Supreme Court last week gave another that seriously concerns the civil rights of negroes in some of the Southern States. The particular case arose out of that peculiar system under which, in lieu of the ordinary form of punishment for a criminal offence, by fine or imprisonment, the offender is virtually placed in a state of peonage. The practice consists in permitting a planter to become surety for a negro condemned to pay a fine for some petty offence, the negro contracting to reimburse the planter by a long term of service, the breaking of this contract being itself treated as a crime and subjecting him to fresh arrest and punishment. Justice Day, in handing down the opinion of the Court, drew a clear distinction between the "involuntary servitude" imposed by the State as "a punishment for crime" which is contemplated in the Thirteenth Amendment, and this kind of involuntary servitude of which the duration and character are practically beyond the State's control. "This system," says the Court, "is in violation of rights intended to be secured by the Thirteenth Amendment," and of laws enacted by Congress in pursuance of that amendment. There is, moreover, in this matter, no reason why any intelligent Southerner should desire to countenance an evasion of the Constitution. Quite apart from any question of right, the thing is sordid, barbarous, and demoralizing.

The first meeting of the City Managers' Association, held last week in Ohio, might be supposed to emphasize the parent-and-child relation between the commission and the city-manager forms. If it has done so, it is in no filial way. There was more than a hint in its three days' session that the city manager was often a product of inherent defects in the older plan. It was shown that in six months, April to November, the number of city managers in the United States has increased from 13 to 22; and that in many cases the office was created by cities previously under a commission. The trouble was the failure of the commissioners to coöperate, and the inability of the city to get centralized administration and responsibility out of a five-member or seven-member board. Thus Houston, Texas, has recently made the Mayor a virtual city manager, vastly increasing his powers at the expense of the city commissioners. The dissatisfaction of Cadillac, Mich., with a jangling board recently led, as the city manager explained, to the board's recall. In the November *Political Science Review* we find this objection put in extreme terms by the director of the Texas Bureau of Municipal Reference and Research, who concludes that "the superiority of the city-manager plan" over the commission form must be as quickly recognized as was the latter's superiority "over the old mayor and council form." Evidently, cities contemplating the first innovation should look before they leap to see whether the second is not involved in it.

Summing up the most salient results of an extensive tabulation of suicide statistics for 100 American cities, in the New York insurance journal, the *Spectator*, Frederick L. Hoffman says that the maximum rate per 100,000 inhabitants was reached in 1908, since which time there has been a steady decline each year. The rate for 1913, which was 18.7, is the lowest since 1903, with the exception of the year 1906. As one is accustomed to think of the suicide rate as increasing, the world over, this is a welcome showing. When Mr. Hoffman proceeds to draw a conclusion from it in regard to general conditions, we feel that he is going beyond what his basis warrants:

> A diminishing suicide rate may be safely assumed to reflect in a general way an improvement in the social and economic condition of the country, and in this respect the evidence available is quite conclusive that the year 1913 was one of widely diffused prosperity.

Not *quite* conclusive certainly; for we note that in the three years of extreme business depression, 1894-96, the rate was 15.2, 15.2, 15.7, while in the six years of business prosperity, 1899-1904, it ranged from 16.0 to 20.1. However, Mr. Hoffman's conclusion is incomparably better warranted than the sweeping one drawn by the late Alfred Russel Wallace from the statistics of the suicide rate. Its increase in recent times was one of the three things upon which alone, so far as specific data are concerned, he relied for confirmation of his sweeping conclusion that mankind has made no moral progress since the days of the pyramid-builders.

President Hadley's "less obvious, but more fundamental" objection to the suggestion of an additional college at Yale is, we fear, reactionary. "We want," he asserts, "a more intellectual atmosphere among the students as an immediate essential for making Yale what it should be." And again: "We are not offered anything" in the new plan "that will give intellectual stimulus." It will strike persons of progressive leanings that President Hadley is a bit fond of the word "intellectual." Even a university, of course, will not be injured beyond repair by a modicum of intellectuality. Some of our colleges, perhaps, might be able to stand more of this element. But upon the attitude of others, we fear, President Hadley's "intellectual stimulus" would have very much the effect of the introduction of a foreign substance in the eye. There is one standpoint from which his policy is defensible. We have too little respect for relics in this country. Progress means with us, not only proceeding, but also obliterating the past as we proceed. For the sake of the museums of the future, any university with an "intellectual atmosphere" ought to be preserved. Of course, if it can be preserved alive, as President Hadley is so hopeful as to think, by all means let this be done.

South America was no doubt badly hit by the war. Scattered items have been published, such as the fact that 14,000,000 of Brazil's 17,000,000 bags of coffee must be stored at home. A comprehensive statement that came last week from Argentina in President de la Plaza's special message shows that in his country, at least, the financial storm can easily be weathered. The estimated deficit is nearly 27,000,000 pesos. This can be taken care of by careful economy. New offices created last year will not be filled; all public works not urgent will be postponed. A special commission has for some time been studying administration in Argentina, and its work can be utilized. The fact that the republic has a large income from state industries, railways, and leased lands decreases the importance of customs duties in the budget. As the total yearly expenditure of Argentina has been about 420,000,000 pesos, a saving of 30,000,000 would be equal to one of nearly $50,000,000 in the United States.

A TRUE AMERICAN VOICE.

The one part of the President's message to Congress upon which every reader of it will eagerly fix is that dealing with the questions of national defence, and of the duties of this country growing out of the European war. Mr. Wilson discusses other matters. He makes certain recommendations which will be the subject of controversy. But they will be overlooked to-day. Everything will be for the moment forgotten except the passages of his address in which he sets forth his conception of the correct military policy of the United States. The President had already briefly informed Representative Gardner that he was opposed to the special inquiry into our preparedness for war. Before Congress on Tuesday he went into the whole subject.

Mr. Gardner had expressed the fear that the President would lay "the cold hand of death" upon his pet project. But all that Mr. Wilson lays upon it is the cold hand of reason. Of that, Gardner has much more cause to be afraid than of death. So have the people vaguely excited about the asserted helplessness of the country to defend itself. To them all the President says, "Come and let us reason together." His discussion of national defence is eminently reasonable, looking before and after. The possibility of disarmament he does not even refer to. He merely affirms that we have had a consistent American military policy, purely defensive in motive; that the navy and the army have not been, as rashly alleged, neglected; that a normal and moderate increase in the strength of both is to be expected and, indeed, is planned for; and that nothing in the situation growing out of the European war should cause us nervous apprehension or lead to a panicky change of our historic policy.

President Wilson's calm assertion is that "no one who speaks counsel based on fact or drawn from a just and candid interpretation of realities can say that there is a reason to fear that from any quarter our independence or the integrity of our territory is threatened." This is his answer to the horrid imaginings which have affrighted the soul of Congressman Gardner. Significantly, this answer is accepted as accurate by a man who, on general principles, favors a comprehensive inquiry into our military expenditures. In them Professor Emery of Yale believes that there has been much lack of coördination and waste; and would like to have a "quiet consideration" of all these matters. But he is as much averse as the President is to losing our self-possession, or to countenancing a "panicky movement" of any kind. And he adds, in strong confirmation of the President:

> I am not one of those who believe that the present European war has increased our own dangers of attack from outside. On the contrary, I believe just the opposite. Whichever side wins in this great conflict, the result will mean such an exhaustion of resources, such a weariness of war, that no member of either side is likely to attack us for years to come.

We have placed these considerations first, because they come first strategically. The President is not content with merely setting his face negatively against impulsive efforts to commit this nation to a vast though indefinite war-like policy. He shows what has been done, and what we may reasonably expect will be done, in attending to due measures of national defence. It is a part of the work of Government which, he says, must not be neglected, and has not been. He is careful to guard against misconception. Because he declines to throw himself into the arms of the flustered extremists, they must not say that he is indifferent to this or any other demonstrated need of the nation. All this is unquestionably sound tactics and good politics. It will make it much easier for the Democrats in Congress to stand with the President. Already, in fact, they are beginning to carry the war into the Republican camp. "You say that we have no navy fit to put to sea, and that our army is a broken reed. Then what have you done with the billions of money of which your party has had the spending for the military forces?"

It is, however, when President Wilson speaks of the ancient hopes and the true destiny of the American people that he is most effective. It is hard to read his moving re-statement of old truths without a gladdening of the heart. Praise falls away from the fine eloquence of this part of the President's address, with the feeling that there is nothing to do but to urge everybody to read it and lay it to heart. It is the true American voice. Mr. Wilson declares that he has tried to find out what the mass of the plain people are really thinking and feeling and hoping. There can be no doubt that he has come nearer doing it than have the clamorers for war and for mighty preparations for war. Defence? Yes, if necessary. But we are not to conjure up vague fears. Thoughts of aggression we are to put far from us. Conquest of other lands is as much ruled out as conquest of our own. We are to give the old ideal America a free course to run and be glorified. All this is magnificently put by the President. And he rises to great power when he points out the criminal folly of doing anything at this time to destroy the splendid opportunity which may soon be ours to help the world to peace and healing. As for our national defences, we may all feel that we have one mighty bulwark—a President who has met the crisis with poise and energy, and who defends us against those of our own citizens who forget the true grandeur of this nation. As the President says:

> To develop our life and our resources; to supply our own people, and the people of the world as their need arises, from the abundant plenty of our fields and our marts of trade; to enrich the commerce of our own States and of the world with the products of our mines, our farms, and our factories, with the creations of our thought and the fruits of our character—this is what will hold our attention and our enthusiasm steadily, now and in the years to come, as we strive to show in our life as a nation what liberty and the inspirations of an emancipated spirit may do for men and for societies, for individuals, for States, and for mankind.

THE CROWN PRINCE ON THE WAR.

The defence made by Germans against the charge that on their country lies the responsibility for having brought on this war has taken two forms. Some insist that the Kaiser and his Government made every effort to prevent the collision, and that they were thwarted by the bellicose acts of Russia, or by the deceitful diplomacy of England. By others, all the emphasis has been laid upon the situation in which Germany found herself: shut in by an iron ring of foes, through which she had to break by force of arms, war was her only recourse if she was to remain a great nation.

Both pleas have been used by one and the same person in one and the same utterance, though it is hard to make them go together. No such attempt is visible in the words of the Crown Prince. When at the outset he declares that "this whole business" is "senseless, unnecessary, and uncalled for, but Germany had no choice in the matter," it might be possible to understand these words, taken by themselves, as meaning that, in the critical days of the last week of July, Germany had done all in her power to prevent the war—a contention which, as we have more than once set forth, is completely disposed of by patent facts. But this is not in the least what the Crown Prince means. Germany's justification in the war, Germany's right to say that the war was forced upon her, does not rest, in the Crown Prince's mind, upon any details of the events of four months ago. What he talks of is the iron ring; "we foresaw, and as far as possible forestalled, the attempt to crush us within this ring."

And he goes farther. Speaking not only for himself, but for the whole German people, he lays down a view of the "iron ring" which goes beyond the wildest assertions as to its nature that we have seen emanating from any responsible source. "No power on earth," he declares, "will ever be able to convince our people that this war was not engineered solely and wholly with a view to crushing the German people, their Government, their institutions, and all that they hold dear."

Concerning the attitude of the Triple Entente towards Germany, there is ample room for diversity of judgment. That it was natural for her to feel aggrieved at being balked in the oversea ambitions which she cherished, nearly every one will admit; though to what extent even this degree of hostility to her on the part of her neighbors was due to resentment and suspicion caused by her own militarism is a question that cannot be ignored. Between this grievance, however, and that terrible "iron ring" of which we hear so much there is a great gap. That the two things look like one to the German imperialist mind is itself an illustration of the way in which a nation, no less than an individual, may gradually become the victim of an overmastering obsession; and when it comes to a belief that what the Triple Entente all along was after was to "crush the German people, their Government, their institutions, and all that they hold dear," we pass beyond the region of obsession and arrive at that of pure hallucination.

How a mind filled with the imperialist ideal and imbued with the militarist spirit passes from the realm of sober reality to that of vague and grandiose visions can hardly be better illustrated than by comparing this statement of the Crown Prince with what he was in the habit of saying before the war. It happens that, in the July number of the leading Austrian magazine, the *Oesterreichische Rundschau*, the principal article was upon the Crown Prince as the exponent of German imperialism. Here we find his well-known glorification of war, his proud consciousness of the martial tradition of his race, his conviction that only by the maintenance of that tradition can Germany remain a great and noble nation. But not a word about any danger that the German people may be crushed, or their institutions destroyed. Not defence against a foe threatening her life, but quite a different *motif* runs through all his exaltation of preparedness for war and of joy in battle. "The German Empire," he said in a famous outgiving a few years ago, "has, more than any other of the peoples of our old earth, the sacred duty to maintain her army and her navy always at the highest point of readiness to strike. Only so, relying on our good sword, can we obtain the place in the sun which is our due, but is not voluntarily conceded to us." Expansion, not self-preservation, was then the sufficient ground for Germany's readiness to fight; and nothing could be plainer from the whole tenor of the Crown Prince's thought, as shown in the *Rundschau's* approving article, than that he and his fellow-imperialists looked upon war as not only the natural, but the desirable, means of giving expression to the nation's aspirations.

It is not necessary to suppose that the Crown Prince is a man who delights in slaughter or is unmoved by the sight of suffering. The world's quarrel with him and his kind is not a personal one; to the millions laid low by this war it matters little whether he is a Prince Charming or a Bluebeard. What affects the world is not his personal merits or defects, but that attitude towards the world's deepest and most vital concerns which he and those who stand with him represent. "There is no war party in Germany now, and there never has been," he says; and the more sincere he is in saying it, the more hopeless is the gulf that separates him from what, here in America at least, we still fondly think of as the spirit of our age. There *is* a war party here—a small one, to be sure; there *is* a war party in France, in England; if the Crown Prince can think that there is no war party in Germany, it can only be because he imagines that his own love of war is shared by the whole German people. If a whole nation regards war as its chief interest there can, of course, be no war party. But the Crown Prince is mistaken. The splendid devotion the German people have shown at the call to arms is no proof that the gospel of militarism had been accepted by the whole nation; it is proof only that there is no sacrifice which they are not glad to make in the service of their country. When the war is over, and not until then, will the German people have an opportunity to think, and to speak their thoughts, on the militarist obsession which is costing them, and all the world, so dear.

ADMIRAL MAHAN.

Admiral Mahan was not at all a prophet without honor in his own country, yet it is undoubted that his first great fame was won abroad, and that it always remained higher in Europe than at home. The feeling tributes to him by the English press are an indication of the esteem in which he was held in England. The reason lies on the surface. Admiral Mahan had the singular good fortune of being able to interpret English history to Englishmen. They had done great deeds; he first made them understand the full significance of what they had done. As a piece of philosophical historical writing, his book on Sea Power will long hold its high repute. It meant far more to England than, for example, Motley's histories did to the Dutch. For Mahan was not merely a delver in the archives and a collector of facts—his style was much less brilliant than Motley's—but had the insight and the grasp to wrest the core of truth out of the period of which he wrote. This came almost with the force of a revelation to the nation with whose history he was dealing. As Englishmen read his lucid and masterly account of the way in which Nelson was the chief throttler of Napoleon, and saw that their safety had really been secured by the lonely vigils as well as the fighting of British sailors, storm-tossed for years from the Nile to the Baltic, their hearts burned within them. And they continued to sit at the feet of Admiral Mahan as their wisest teacher about these critical events in their past.

No such vivid national interest for his own countrymen attached to Admiral Mahan's writings. This would account for their comparative lack of appreciation, or at least of popularity, here. Nor can it be said that his gifts for narrative or for literary expression were such as to draw the general reader to his works. His style was, indeed, well fitted to the task he set himself. It was clear, though not picturesque, and was of cumulative weight. To get the real impact of his argument you had to have a patience and a comprehensiveness something like his own in marshalling facts and compelling them to yield their true meaning. His conception was original and powerful, but it took time and iteration to work it out. So there is little movement or glow in his pages, though one comes occasionally upon a passage of appealing eloquence. And it is to be observed also that Admiral Mahan became increasingly abstract, almost metaphysical, in his later writings. This is no reproach to a writer who was dealing with such theses as his. An argument may be a very good one even if subtle and deeply pondered. But it is not the kind of argument that takes hold of the popular imagination. Voltaire has something about the "big" books never being the ones to set a nation on fire; it being always the little books, packed with emotion, aflame with passion, that do the business. Admiral Mahan's writings, distin-

guished as they are, influential as they have been, could never be ranked, in this kind of effect, with those of Rousseau or even of Tom Paine.

In Admiral Mahan's later years, after his retirement from active service, he held a unique position and exhibited a strange blending of qualities. He got to be a sort of transcendental apostle of war. In this, we do not doubt, he was perfectly sincere. He was a man of deep religious faith, often prominent in church gatherings. But somehow his piety got mixed up with his naval formulas in a way often to jar upon a sensitive mind. In point of fact, Admiral Mahan was about the nearest type we had to the German glorifiers of war on high and mystic grounds. We do not mean that he was a belligerent or aggressive man; at heart he loved peace, unquestionably. But somehow his long brooding over the clash of national wills and the enginery of war inclined his mind to see in ships and guns the peculiarly chosen instruments of the Divine purposes. This lent a fervor and an appearance of moral elevation to his arguments for mighty armaments, but could not cover up the "double nature" which he came to exhibit—the devout Christian and the eager naval strategist.

Some have spoken of Admiral Mahan's death as untimely. If we could but have had his critique of the present war, of all the operations of which at sea he was a close student, till his health broke! He lived long enough, however, to see his theories of sea power impressively vindicated. He might not have been content with the work of the British navy up to the present, but he could have pointed to the fact that it was successfully discharging its old and chief function—holding the command of the sea, keeping commerce flowing freely to English ports while shutting it off from the enemy's country, and standing ready to repel any attack on the sea-walls of England.

THE BRIGHTER SIDE OF DIPLOMACY.

It cannot be said that this has been a banner year for diplomacy. As an insurance against war, it has been as ghastly a failure as has invincible armament. If a diplomatic negotiation was ever more shockingly mishandled than that leading up to the European combat, we do not know where to look for its record. With the general outside opinion that the most glaring faults were committed by the German diplomats, many Germans agree—at least in private. If the report, a few days ago, from Berlin had been true—as, of course, it was not—that the Kaiser had notified some of his diplomatic agents that they were at liberty to seek another career, it would have only expressed, in a heightened way, the feeling which has frequently been intimated in German publications, that Bismarck would never have permitted Germany to go to war against such a combination of great Powers. Nor are those who were in charge of the foreign policy of the other nations to be held blameless. All told, the high function of diplomacy in keeping the peace was miserably discharged. If Coleridge had lived to see the exhibition, he would have put added emphasis into his exclamation, "Your art diplomatic is stuff!"

But there is a brighter side to the story. It is one of which Americans are agreeably reminded by the return home of Ambassador Herrick. What we mean is, of course, the great opportunity which has come to our Ministers and Ambassadors abroad to do humane work, and at once to heighten the prestige of the American diplomatic service and create a feeling of marked respect and friendliness for our country. Mr. Herrick brings back with him a reputation for quiet efficiency in Paris, at a time of great emergency and confusion, full worthy to be compared with that of Minister Washburn in 1870. And the private and public testimony which has come across the water in praise of the work of Ambassador Gerard in Berlin, of Penfield in Vienna, of the two Pages, one in London and one in Rome, of Brand Whitlock in Belgium, of Dr. van Dyke in Holland, and in these last few days of Ambassador Morgenthau in Constantinople, is something in which Americans may legitimately take pride. Diplomacy, after all, must have some life and some grace in it if it is able thus to relieve some of the suffering caused by war and to strengthen international friendships even while the belligerents are tearing at each other's throats.

It is a particular piece of good fortune that American good offices have been put at the disposal of Japan in the course of this war, and that the Japanese Government is duly grateful for what an American Ambassador has been able to do for its subjects in an enemy's country. The *Japan Times* of November 4 devotes an entire article to this subject. It recounts the fact that the Japanese Ambassador in Italy, Baron Hayashi, had telegraphed home an appreciative account of the labors of Mr. Gerard in behalf of Japanese caught by the war in Germany. Those who were detained received friendly oversight, and some were aided to reach Switzerland. At last accounts, it was believed that all the civilian Japanese in German territory had been, through Ambassador Gerard's friendly and persistent representations to the German Government, permitted to leave the country. Speaking for the Japanese people, the *Japan Times* declares: "This is a great debt we owe to the United States."

To have been able to render this service to Japan ought to be a peculiar gratification to Americans. Our public relations with Japan have not been marked by the finest delicacy on our part. A polite and sensitive people themselves, the Japanese have often thought they were treated with scant consideration by Americans. This is notoriously true of a portion of our press and people; it is also true in a degree of our official attitude. The Japanese have given many proofs of their desire to be on friendly terms with us—always, to be sure, consistent with their ideas of national dignity. They have often gone out of their way to show special favors to Americans, as when the Mikado recently gave a sum of money—$25,000, if we remember—to an American hospital in Japan. But such gracious advances have either been on our part rudely received or coolly ignored. We have acted as if the Japanese were only giving us our due, while we were under no obligation to them whatever. And travellers in Japan tell us that this conduct, of which as a nation we have too frequently been guilty, has left its hurt in the Japanese consciousness. All the more significant and welcome, then, is this public service which American diplomacy has been able to do the Japanese. Their grateful thanks should prompt us, on our side, to look to the courtesies of international dealing more carefully than we have been wont to do in the case of Japan.

The whole record of the work of American diplomats during the past four months should help us to a better notion of their duties and of their usefulness. The business is not all ceremony and convention. A human heart beats under the official coat. Nor are we to think of diplomacy as taken up with causes of friction—with protests and ultimatums. In the light of what has happened, we can see its possibilities in the service of humanity and in strengthening the ties that bind nations together. It was a great opportunity which the war placed before our Ministers and Ambassadors in Europe, and the manly and spirited way in which they have risen to its full height is something in which we can all take honest satisfaction.

Chronicle of the War

The indications to which we referred last week that the time has come for the assumption of a vigorous offensive by the French and British troops in France and Belgium appear to have been confirmed by the events of the past few days. At both ends of the long line, in Flanders and in Alsace-Lorraine, an offensive movement has been undertaken. The motives that have decided Gen. Joffre to abandon his Scipionic strategy are to be looked for in the recent development of the campaign in Poland. The time has come for the French and British to return the courtesy extended to them by Russia in the early stages of the war when the hazardous invasion of East Prussia was undertaken. That adventure was disastrous to the army that engaged in it, resulting in the catastrophe in the Mazuran Lake region, but it succeeded in its immediate purpose, which was to ease the strain upon the Allies in the west. Full credit has perhaps not been given to the loyalty of Russia to her allies in thus embarking on an isolated adventure, based on no general strategic plan, and foredoomed almost from the first to disaster, in order to assist the common cause.

It now becomes the task of the Allies to repay the service, of incalculable value at a most critical moment, which Russia rendered them at the beginning of the war. Whatever the issue of the fighting in Poland, an offensive movement in the west would seem to be recommended by the general situation. If Russia wins the battles now in progress, and succeeds in rolling back the tide of Germany's invasion to the frontier, her task of pursuit and her invasion of Posen and Silesia will be rendered the easier if a vigorous offensive on the western line of battle prohibits the sending of first-line German reinforcements to the east, and at the same time the offensive of the Allies will be facilitated by Russian success. If, on the other hand, the result of the fighting in Poland is unfavorable to Russia, if her armies must again be withdrawn from East Prussia and from before Cracow, in order to straighten out a defensive front from the East Prussian border to Warsaw and along the Vistula, then the necessity for the Allies to press a vigorous offensive becomes even more imperative. As the Russian offensive at the beginning of the war relieved the pressure on the Allies, so should the Allied offensive now, if the Russians should be beaten, weaken the full force of the German attack in the east, and allow the defeated troops time to recuperate.

We explained last week the indications that have appeared to mark the beginning of the Allied offensive, but we omitted to mention one consideration which has been much emphasized during the past few days in the French official dispatches: that is the superiority that is asserted for the artillery of the Allies over that of the Germans. Hitherto the advantage in this branch of equipment has been all on the German side. It was notorious, as we have pointed out previously, that France entered the war unprepared. The deficiency in her equipment, particularly in guns of heavy calibre, if we may judge from recent dispatches, appears now to have been made good, and we may accept the statement that in artillery an equality with, if not a superiority over, that of the enemy has been established. In this connection we may draw attention to the interesting *Bulletin des Armées*, reviewing the military operations since the outbreak of the war up to December 1, portions of which were cabled to American papers last Saturday. Of the artillery, the *Bulletin* says: "Our supplies of artillery and ammunition have been largely increased. The heavy artillery, which we lacked, has been organized and is working well." The numbers of the French army are stated to be the same as they were on August 2, and the quality of the troops, it is pointed out, has improved vastly. The *Bulletin* is especially frank in speaking of the early mistakes of the war. "The higher command," it says, "renewed on account of necessary dismissals, has not committed during the past three months any of those faults noted and punished in August."

That the Allied offensive should be initiated not along the whole line, but on the two wings, is a strategy dictated by sound and obvious reasons. On the centre, not only are German intrenchments strongest, but there is the nearest point to Paris. An unsuccessful offensive followed by a retreat would bring the Germans back to the Marne and again in uncomfortable proximity to the capital. The natural lines of attack are plainly on the two wings. On the left are the British, with an especial interest in the coast line and the port of Ostend, and there, too, they will have the advantage of the cooperation of the navy, which has already proved so effective in defence. On the right wing along the line of forts, Verdun, Toul, Nancy, the French have kept constantly concentrated a strong force, which has not only been able successfully to repel repeated German attacks, but has crept slowly forward in the direction of Metz. Here, too, the French are on the borders of the enemy's country, and will have the advantage of invading a district where the population is friendly to them.

In Alsace some progress was reported during the past week, for names come into the dispatches that were familiar in the first two weeks of the war in connection with the disastrous adventure into the lost provinces. We hear of the capture of positions southwest of Thann and of the presence of French troops in the neighborhood of Altkirch. At the other end of the line slight progress is reported on the line of the Yser, on the left bank of which, however, the Germans still hold a few intrenchments, and in the triangle formed by Dixmude, Ypres, and Roulers. The Germans are apparently making preparations to meet an expected bombardment by warships at Zeebrugge, nine miles along the coast above Ostend, and three miles north of Bruges. It would be interesting to speculate on the possibility of a flank attack being launched from the sea at this point. Elsewhere on the line the most definite progress has been made west of Bethune, where the village of Vermelles, the centre of a network of roads and commanding a railway, has been taken. This represents an advance of some five miles.

Following the premature and unofficial news of sweeping Russian victories in northern Poland comes the bare statement from Berlin that German forces occupied Lodz on Sunday. This news is undoubtedly accurate, and is confirmed by a statement from Petrograd on Tuesday declaring that the question of the defence of Lodz has "lost its urgency." This lengthy statement covers the operations of the campaign from the beginning of November to December 5. Neither from Berlin nor from Petrograd have we, as we write, any light on the immediate sequence of events that led up to the capture of Lodz or upon the results of the occupation. We may assume, however, that the renewed German offensive is directed first of all against Pietrkow, the occupation of which would secure the domination of the railway from Warsaw to Czenstochowa, and would imperil the integrity of the Russian line. The plan of the Germans is doubtless to cut the line at Pietrkow, in which case either the Russian forces in Galicia would be compelled to fall back from before Cracow or they would be exposed to a flank attack and possible envelopment. To what extent the Russian position at Pietrkow is threatened by the defeat at Lodz it is impossible without further information to say, but Berlin comments temper their rejoicing with the warning that only by an extremely vigorous pursuit can the victory be consummated. It is probably safe to assume, therefore, that the Russians have retired on a strong defensive line, especially in view of the fact that we have no hint of any withdrawal of their forces from the region of Cracow. So long as they can hold the centre and keep the wings thrown forward in Galicia and in East Prussia the Russian position may be considered as favorable, and the main purpose of the German aggression in Poland to have failed.

The Russian official statement to which we have alluded, though somewhat confusing in parts, enables us to gain a fairly clear idea of recent operations in Poland, from the German retreat from in front of Warsaw to the days immediately preceding the battle at Lodz. The Germans apparently retreated in a southwesterly direction on a line stretching from the River Warthe to the Nidzitsa. Arrived at their own frontier, they made use of the strategic railways to rush the retreating troops northward, and concentrate them on a line between Thorn and Slupca. The Russian line we may imagine as pursuing in a southwesterly direction, with its right thrown out to and resting on the Vistula. Against this right the Germans launched their counter-offensive, driving it back and winning victories at Wloclawek and Kutno. This involved the retreat of the whole Russian line, and the German centre, ignoring the Russian right wing, which had by this time made a stand, pressed on, cut the Russian centre by desperate efforts, and advanced in the direction of Strykow and Tuszyn. Here for a time was the most dangerous situation for the Russians, which by tremendous exertions they converted to one equally dangerous for the German centre. Strykow and Brzeziny were retaken, reinforcements apparently came from the neighborhood of Pietrkow, and the German centre was all but encircled on the Lodz-Zdunskawola front, but succeeded in cutting its way out and re-forming the line for a renewed offensive.

Foreign Correspondence

THE NEW PONTIFICATE—INDICATIONS OF A CHANGE IN POLICY.

ROME, November 14.

(Delayed in transmission.)

Italian newspapers have so far contented themselves with registering the facts in regard to the new Pontificate, with only a few ventures into the realm of prophecy. And yet, always speaking with due reserve, some of these facts are, according to persons of unquestionable authority whom I have the good fortune to be able to consult, of extraordinary significance.

One of the first symptoms to be noted, as indicating an important departure from the policy of the late Pope, was a marked change in the tone of the official Vatican newspaper, the *Osservatore Romano*. Of its tone during the reign of Pius X it is enough to say that it was precisely what was to be expected. In the issue of October 7 there was an article, which was unsigned, but which had certainly received the *imprimatur* of the Vatican authorities, in which it was strongly insisted that the Holy See, and by necessary consequence the Church, must observe the strictest *impartiality* (not *neutrality*, as it was strangely interpreted by some journalists) towards the belligerent nations in the present war. And this impartiality, which is the duty of all Catholics, was asserted to be especially incumbent upon the priesthood, whose sacred office can admit no distinctions of race or nationality. It was not pretended that Catholics, lay or clerical, should not feel and act according to their natural and proper patriotic duties and sentiments; only that Christian charity should rise superior to the rancors and hatreds engendered by the strife. "The attitude which the Holy See assumed," it was further observed, "in the recent conflict for the possession of Lybia, in which also important interests of our country were at stake, shows clearly and incontrovertibly the sincerity and firmness of its intention, which places above every other interest its mission of peace and charity among all the peoples of the earth without distinction of race or creed."

The incidental phrase, *la patria italiana*, which I have translated "our country," caused more remark than all the rest of the article. Never before, since its foundation, had the *Osservatore Romano* used such an expression as *la patria italiana*, or any language implying that an Italian Catholic need have any political aspiration except that of restoring the temporal power to the Pope.

The exhortation to impartiality, however obvious though such a duty may seem on the part of both laity and priesthood, had a special significance at the time. The Catholic newspapers in Italy, which are not, like the *Osservatore Romano*, directly dependent upon the Vatican, were anything but impartial in their attitude towards the warring nations, their editorial articles, and even their accounts of military operations, exhibiting a decided prejudice in favor of Austria and Germany. Five of these papers, the *Corriere d'Italia* of Rome, the *Momento* of Turin, the *Italia* of Milan, the *Avvenire d'Italia* of Bologna, and the *Messagero Toscano* of Pisa, are controlled by a stock company, known as the Società Editrice Italiana, and being the best known and most widely diffused, had attracted a corresponding share of public attention. The Società Editrice Italiana was accused of being subsidized by Austrian capital, with how much warrant I am unable to say, although the priest-ridden character of the Dual Monarchy and the treatment the Church has received in France at the hands of the Radicals are quite enough to account for the prejudice of Italian clericals. At any rate I know that a number of English and French cardinals made a formal protest at the Vatican shortly before the appearance of the article in the *Osservatore*, and the effect was immediately to be observed in all the "independent" Catholic journals, some of which are by this time even making a brave show of patriotism.

It has been reported, and, as I have been able to assure myself, with some probability, that a reform, or rather a reordering, of some of the Roman congregations is imminent. One of the most important, and in general one of the most useful, acts of Pius X was a complete reform, by a decree dated June 29, 1908, of the administrative and judicial procedure of the Church. All judicial competence was taken from the congregations and bestowed upon the Courts of the Rota and the Segnatura, which were by the same act restored; and the functions and attributions of the congregations themselves, which in the course of time had in many cases become vague and even contradictory, were clearly defined. One of the most notable of these changes, and the one perhaps that has commended itself the least, was the enormously increased importance of the Congregation of the Consistory, which became invested with the nomination of bishops. Before that time the suggestion of candidates for vacant sees, and the collection of information concerning them, was the duty of an officer called Uditore di Sua Santita, who was a titular archbishop residing at the papal court. This office, naturally left vacant under Pius X, will probably be restored by Pope Benedict. The Secretary of the Congregation of the Consistory, of which the Pope himself is Prefect, is Cardinal De Lai, next to Merry del Val the most energetic and influential member of the intransigent faction, and to this office was due his great power during the late Pontificate and his personal ascendency over the Pope. In the appointment to vacant dioceses, which must soon take place, of which the most important are Genoa and Cremona, the new order will doubtless be made manifest. I am, however, able to assert in this connection that there is no foundation for the report that Cardinal De Lai will resign his post as Secretary of this Congregation because he now finds himself in opposition.

The letter of encouragement lately written to the Pope by Cardinal Cassetta, Protector of the Society of St. Jerome for the Spread of the Gospel, acquires a special meaning in view of the recent history of this organization. The reproach directed against the Roman Church by Protestants ever since the Reformation for its failure to supply the laity with the Scriptures translated into the vernacular tongues, has had a tardy effect, especially in countries that are prevailingly Protestant. But in Italy and other countries, where the spur of Protestant opposition is wanting, vernacular editions, even of the four Gospels alone, were almost unheard of, and the Society above named was formed, with the approval of Leo XIII, to supply the lack The preparation of the first volume, consisting of the Gospels and the Acts, was entrusted to three priests celebrated for their piety and learning, the Rev. Giovanni Semeria, who wrote the introduction; the Rev. Luigi Clementi, who did the translation, and the Rev. Giovanni Genocchi, who supplied the explanatory notes. Of the quality of the work it is enough to say that a learned Protestant clergyman assured me that there was nothing in introduction, translation, or notes to which he could take exception. It was sold for a few cents a copy, and in a short time many thousands had been distributed.

Unhappily, however, Pius X's famous condemnation of Modernism involved in a wide-ranging suspicion even this modest but useful little book. It goes without saying that everything savoring of modern and scientific Biblical criticism was anathema to the predominant faction in Rome, and the three priests responsible for this translation were too learned in the scientific sense not to fall into disfavor. Fr. Semeria, indeed, who, in his preface, instead of damning Protestants as miscreant heretics, had referred to them as "our Protestant brethren," was finally sent away from Italy, where his preaching had become entirely too popular, and his two colleagues were discredited and suspected. No excuse could be found for condemning the book, but in a short time it was nowhere to be found on sale, and all papal protection and favor was withdrawn from the Society. But now, in addition to the Pope's letter to Cardinal Cassetta already mentioned, the members of the Society have been received in special audience, and personally assured of his patronage and interest in their work.

The appointment of Cardinal Gasparri to succeed Cardinal Ferrata as Secretary of State, and the close relations the Pope is maintaining with such liberal-minded cardinals as Maffi and Agliardi, are so much more evidence to the same purpose. In fact, I am charged by a highly placed ecclesiastic to say that the cardinals are satisfied now that they are being consulted, after a long exclusion from their duty as counsellors, and that the bishops are satisfied because they are being respected, both in their persons and in their just prerogatives.

The *Corriere della Sera* of Milan has published an interview granted to its Rome correspondent by a person said to be deeply versed in Vatican politics, anonymous, of course, who pretended to know that the Pope is already laying his plans to obtain a representation in the European Congress that will determine the conditions of peace at the end of the present war. His chief object would be to obtain a guarantee of his own independence in the sense of changing the Italian Law of Guarantees, with some modifications, into an international compact signed by the Powers of Europe. This would not mean the revival of the question of the temporal power; on the contrary, the Pope might even, under certain conditions, renounce this claim. But the success of the project depends, always according to this anonymous authority, on Italy's not taking part in the war. For, while Italy would in any case be opposed to the participation of the Pope in a European Congress, she could not make her protest felt unless she were a belligerent Power. H. E.

In Notting Dale

A SIDE ISSUE OF THE WAR.

In London, the city of contrasts, one of the poorest neighborhoods is called Notting Dale. It is very close to Bayswater, which is one of the richest, though not at all one of the most aristocratic, because as soon as, being rich, you also become aristocratic, you move from Bayswater to the other side of the Park—very much as in New York, if you live in the West Seventies, you know that you ought to live in the East Seventies if you were really "geboren." Notting Dale, although it is so close to Bayswater, is a much-exploited centre of philanthropy. It used to be famous for its criminals, but they have been crowded out by the ever-increasing tide of social workers, and such of the aborigines as still exist are chiefly notable for the blankness of their poverty.

Notting Dale has a special interest in view of the present war because it was made the scene of one of those well-meaning, if untruthful, rumors which are among the social usufruct of every war. It has been widely stated that one result of present conditions has been a great increase in drunkenness among the wives of reservists and volunteer soldiers. So widely was the rumor spread that the usual rather foolish and hasty legislation has been resorted to, and it is now illegal for any woman to obtain alcoholic refreshment in London before a fixed hour in the morning. That might be well enough, were the restriction also applied to men, who, one may admit, without being an extreme Feminist, need it more; but it is based upon an altogether erroneous premise—upon Notting Dale in fact.

At the beginning of the war there was in England the usual undisciplined outburst of philanthropic endeavor that we have grown to expect in democratic countries. Coupled with grants from the War Office, advanced pay, and the like, this orgy of well-doing resulted in a dangerous situation, in that very shortly after the departure of her husband for the front, the wife of each reservist received, in one lump, sums varying from £5 to £15. As was pointed out, and as was undoubtedly true, many of the recipients had never seen so much money in one sum in their lives. Well-meaning philanthropists, who had not contributed to the original funds, argued with perfect sincerity that orgies of drunkenness ought to ensue. Women of the class from whom reservists are drawn, argued these middle-class philosophers, very often enter public-houses, even when they have very little money. Ergo, when they have more money than they have ever seen before, they will certainly spend their whole luxurious days in public-houses, the brewers will benefit enormously, and the liveliest horrors must result. It is notoriously true—especially of those of us who have the social-work bee in our bonnets—that what well-meaning people believe must be true. And accordingly it became very widely accepted in London, which is to say England, which is to say Europe, which is to say the world, that the women of Notting Dale, which is to say London, which is to say England, immediately after the departure of their husbands for the front, indulged in orgies of drunkenness. As we have seen, the well-meaning brought pressure to bear upon the civic legislature—which, as England is a democratic country, is of course a purely amateur body—and the police regulation has now been enforced which—though the well-meaning, who are mostly women, do not for a moment realize it—is an insult to every woman who ever lived.

As a matter of actual fact, the women of Notting Dale did not indulge in any orgies of drunkenness after the departure of their husbands for the front. I can state this on evidence which no reasonable person can doubt. I could give, that is to say, the evidence of my own eyes (which may not count), of the managers of the local public-houses (which may be suspect), of the women themselves (which may be prejudiced), of policemen (who know more about the real incidents of real life than all the well-meaning educated people who ever lived, taken together), and of officials of the London County Council (whose word, since their official duty is to prove exactly the contrary, may at least be accepted, even by the well-meaning). I have no space in an article of this kind to give chapter and verse, but, should any one feel sufficiently interested, I should be very happy to give facts and figures, which would, I think, leave no reasonable doubt even in the minds of the best meaning of philanthropists. As a matter of actual fact, the takings of the most prosperous public-houses in Notting Dale, which is to say London, which is to say England, decreased very considerably after the departure of the reservists for the front, and the books of the biggest of the West London breweries are there to reprove me if I lie.

But—as is usual with those of us who are well-meaning—while observing the mote, we have overlooked the camel, which happens to be one of the most interesting of the side-issues of the present war. While the women of Notting Dale have been accused of drunkenness, which is not just, they have been acquitted of ignorance, from which charge they could never hope to escape. For the real, the horribly pathetic truth, is that, while the receipts of the public-houses of Notting Dale actually decreased after the declaration of war, those of the candy shops and little general stores where they sell canned goods went up—enormously. Here again I can give chapter and verse for those who care to pursue the inquiry. With them went up the figures of infant mortality. Children died—very young children—not because their mother drank, but because, having, for the first time in her life, the opportunity to "spoil" her baby, she did so with whole-hearted enthusiasm. To be killed with kindness does not often happen to the children of Notting Dale, and when the opportunity came the mothers took advantage of it—horribly.

Those of us who have never been really poor cannot realize what is the supreme ideal of the children of Notting Dale—which is to say of First Avenue. It may be tinned salmon; it may be the most horrible kind of arsenical sweetmeat; it may even be dill pickles of a noxious blackness. At least, whatever it is, our mothers of Notting Dale (or of First Avenue) will give it to us because they are our mothers—and very probably we shall die of it. Do not let us thereafter accuse them of having been drunk on their battling husband's money. For, after all, like most human beings, they meant well.

O. M. H.

The Belgian Hare

THE TRUE HISTORY OF REYNARD THE FOX.

Listen to the true history of Reynard the Fox. It befell long ago, when beasts and birds could still speak, that Noble the lion was lord among the animals. The sun never set on his dominions. But to Reynard the fox it was a sore vexation to see the lion seated securely upon his throne, with a soft radiance of self-approval illuminating his royal countenance. "Especially," muttered Reynard, "when one considers how much cleverer I am than he, or than any one else, for the matter of that." The more he thought about it the more clearly it seemed to be his duty, just because he was so clever, to appropriate the lion's share ("Only to think how he came by it!" snapped Reynard) to his own better uses. So Reynard bided his time.

Now it happened that Reynard's cousin, Grimbert the badger, continually found grievous the many trespasses of the bear cubs; till at last he waxed so wroth at one of them that he followed him even to the door of his cave, making complaint against him with stout words and ill. But his threats and complainings served only to bring a loud growl from Bruin, the big bear.

"Aeh," said Reynard, who was careful to hear everything, "this bear's growling makes me very uneasy." But he told Grimbert and Bruin, who sought his counsel in the matter, that he thought it a great shame if Grimbert could not do as he pleased; for in truth he was not so much afraid of the bear as he pretended to be. Bruin, however, was not content with this, and together they repaired to lay the case before Noble the lion.

He received them with his most ingratiating manner. "Come," said he, "by all means settle this at once; things are very well as they are, and nothing should be allowed to disturb them. Above all, let us have no fighting."

"Nothing could be further from my wish than fighting," explained Reynard, "but this bear's growling makes me so uneasy that I cannot rest. It is not my fault, is it, if Grimbert is a little hasty? Allowances should, I think, be made for him." Hearing some murmurs of disapproval from the other animals, Reynard turned upon them with vehemence. "Little thanks I get from you all, and from you, O lion, who ought to be especially grateful to me. Know you not

that Bruin has long time planned to seize the lordship of the beasts for himself, and that it is only I, with my cleverness, that stand in his way? What would become of you if I were not here to shield you from this rude tyrant? Instead of blaming me you should give me your help, for I am the protector of you all." So saying he threw his glove at the feet of the bear, who nothing loath took up the gage.

While he was speaking, in came Chantecleer, the cock, and amid great lamentation recited how Reynard had by force made off with two of his fairest daughters. "I cannot deny this," said Reynard, "but it is necessary for me to live, and I only took what I felt belonged to me. They walked right into my mouth, and indeed I could not help it. Besides, all this happened a very long time ago." But Chantecleer, whose grief was unassuageable, said that he would throw in his fortunes with the bear against the fox.

Now it was plain that Noble the lion was in no mind for battle, having many troublesome concerns at the moment. And, though he bore Reynard no love, and had many times at the feast grudgingly given him only the bones and the hide for his share, still, when pressed for his judgment, he gave it as his hope that the thing might be patched up somehow. With that they all dispersed to prepare for the battle, Reynard muttering as he went, "It is strange these beasts are not fond of me, in spite of my cleverness. I will fight them all if needs must. I think I am a match for them and more, and it is better to perish than not to lay claim to my rightful lordship." So it was not long before they were all back once more, clamoring more loudly than ever. A new charge was laid against Reynard. On his way he had met Kyward the hare, and promised to teach him his letters, but no sooner had he got the hare between his knees than he flew at his throat and all but devoured him. At this, Noble the lion roared with indignation, for he, with the other great beasts, had promised not to hurt the hare, and he considered him under his special protection. But Reynard, as usual, was provided with excellent reasons.

"I remember my promise," he said, "but when I made it I did not think I should ever want to break it. I could not resist devouring Kyward, he was so tempting. Besides, he was stupid, and would not learn his lesson, and who shall blame the teacher if he chastises his pupil? I dare say, too, that sooner or later, O lion, you would have eaten him yourself if I had not been beforehand. Just recall for a moment the fate of the lamb that drank out of the same stream with you, and you will see that you are no better than I. For all that," continued Reynard, "I would that you held your hand till I had settled my score with Bruin and Chantecleer."

"In faith," roared the lion, hurling his gage at Reynard, "let it be trial by combat to the uttermost. I will avenge the helpless hare, and make an end of all your tricks."

"Since you are all against me," snarled Reynard, "I will fight you all, and my vengeance will be severe. Everything that has been said about me is a lie. I do not want to fight—but I do want an empire as broad as ever the lion's was. Why not? I will have my answer at the hands of you all."

So the battle was forthwith set in order at —— (*the rest deleted by the censor*).

Correspondence

DR. CONYBEARE'S ANALYSIS OF THE WAR.

To the Editor of The Nation:

Sir: Your readiness to publish my criticisms of "Vernon Lee" encourages me once more to address you, but this time in order to deprecate the tone of mocking exultation in which, in your issue of October 15, Sir H. Lucy refers to the impending removal from St. George's Chapel at Windsor of the banners and insignia of the Emperor William and of other German princes in their quality of Knights of the Garter. To my mind their removal, even if it be inevitable, is a matter to weep over and not to jest at. The Germans are fighting for their very existence as bravely as ourselves, and, though it is our duty to denounce the ruthless ferocity with which they have treated a small free nation that had given them no offence and only desired to be let alone, it is equally our duty to abstain from embittering the quarrel by vilipending their rulers and statesmen. I fear it is our national assumption of superiority, and our innate propensity to depreciate other races, that more than anything has focussed on us the dislike of our German cousins. I remember the Homeric laughter of the English press over the little fleet which they sent to China in 1896. I regarded it as of evil omen, for I knew well the *Fleissigkeit* of the Germans in trade, in natural science, and in all branches of learning. I felt that, if they chose, they could build and train as good a navy as our own. Perhaps it was our ill-timed ridicule of them on that occasion that stimulated them to become our rivals on the sea even more than a legitimate anxiety to protect their growing commerce.

If the English and German races were going to disappear in the course of this generation from off the earth, such hatred and contempt as, alas, just now colors much that is written and published in both countries, would do less harm; but both races will, I imagine, continue to exist for thousands of years, and we must in time learn to respect and, I hope, like each other; the sooner, therefore, the embers of mutual hatred and distrust are quenched the better for mankind in general. I still cherish the hope that the United States may do something ere long to reconcile us with each other; for, after all is said and done, the Germans are our natural allies in Europe; they are after the Dutch the only European race at all akin to us. Had I had a boy to educate, and could not have educated him in England, I would have sent him to a German gymnasium and nowhere else; for my experience of German boys is that they are sane, healthy minded, frank, and truthful. Nor have I ever met in other countries with such hospitality as the Dutch and Germans treat you to. What other people welcome you in their homes and half kill you with good cheer? What other people have got the word *home* and all the tender associations of the same? It grieves me to think that such loyal, kind people as were many of them whom I have known privately should have made the name of Belgium an eternal blot upon their escutcheon; that having reduced the little country to widespread misery and famine, they should still be wringing gigantic fines out of its cities. In 1870 they set an example of humanity in war; now they violate every convention by which international jurists have sought to mitigate its horror. Their ideal is summed up in their word *Schrecklichkeit*. It is appalling.

However, one cannot indict a whole people, and I believe that an hour of resipiscence will come, when the German savants and professors who have persuaded themselves—in the teeth of the avowals of their Emperor's own Chancellor—that it was England and France that began the violation of Belgian territory, will regain their right mind, and recognize that the English had no choice but to honor their solemn guarantee, and went to war from a generous, honorable, and indeed quixotic motive, to wit, in order to defend a weak state, that appealed to them, against the aggression of the strong. They credit us with a deep-laid plot to "down" them; but, cherishing such an aim, should we have been content with a paltry army of 150,000 men? Should we not have prepared an army of a million or two of trained men? Our very unpreparedness should surely acquit us of having nurtured any intention of destroying Germany. Let any one read the solemn debate in the House of Commons which preceded our declaration of war, and one must feel that our democracy entered on it from a stern sense of duty and out of pity for the weak. Germany has been arraigned as the aggressor by her own ally, Italy, and, had our motives been as base as these German savants pretend, we could never have earned the sympathy and approval of the Irish Nationalists—who frankly and justly condemned our Boer war—much less of the American nation.

Yet the fact remains that most Germans at this moment regard their Emperor as a martyr, as a victim of Russian aggression. Is it possible that there is something to be said in favor of their view? Such is the atmosphere of suspicion and hatred engendered in England by this unhappy war that I would hardly dare suggest in our press that the devil need not be so black as he is painted. In philosophical and theological debate I have always tried to see an opponent's point of view. Is it wrong, because I am an Englishman and at war with Germans, for me to try to see their point of view? I can not believe it is, and therefore I do not scruple to acknowledge that the Kaiser did at the eleventh hour attempt on the three days July 29-31 to avert war.

My understanding of the correspondence which in that interval passed between Kaiser and Czar may be wrong, but it is this: The senile, testy, and somewhat vain ruler of Austria had on July 23—I believe behind the back of the Kaiser—issued his provocative note to Servia, with the fixed intention of forcing war upon her. The Kaiser, when he came to know of it, took no overt exception to its terms, and was by no means opposed to what he deemed the condign punishment of a regicidal little state. Russian sentiment was favorable to the Servians, as it had been even on a former occasion when they murdered with every circumstance of barbarity their own King and Queen. Austria now mobilized against Servia, whereupon the Russians mobilized against Austria, whose ruler refused to discuss the issue with them. Thereupon the Czar appealed, on July 28, to the Kaiser to mediate with his ally and induce him to resume *pourparlers* with Petrograd,

to agree to restrict his operations against Servia to the limits of a merely punitive expedition, and to pledge himself to retain no Servian territory at the end of it. The Kaiser had virtually obtained these terms from Franz Joseph on July 31, when he learned that Russia had mobilized her entire army, not only against Austria, but against himself as well. Forthwith he wired and reproached the Czar with this, that having sought and obtained his mediation, he yet was at the same time frustrating his efforts for peace. The Czar answers that he "appraises very highly" his "dear cousin's position as mediator," but that he had decided five days before on the military measures objected to by way of defence against the preparations of Austria. The excuse seems to me a little lame, and I think the Czar should have pledged himself at once to stay his mobilization against Germany and give the Kaiser's attempt at mediation time to bear fruit; for it was a method of securing peace less likely to offend Franz Joseph than Sir Edward Grey's proposal of a round-table conference at which Germany, Italy, France, and England should discuss his action and sit in judgment on him. The Czar anyhow went on with his mobilization, whereupon the Kaiser resorted to threats, followed up the next day by a declaration of war.

By his precipitancy in thus declaring war the Kaiser spoiled his case and forfeited the sympathy of all the world. Had he only waited, and allowed Russia to attack him and his ally—and I believe that, once war had begun against Servia, she was fully prepared to assail Austria—he would not only have retained the sympathy of his Italian ally, but have rendered it difficult for England to declare war on him.

I need not add that our English Parliament was, at the moment it declared war, unaware of this exchange of telegrams between the Kaiser and the Czar, and there was nothing before them to modify the opinion that Germany had been throughout as nakedly aggressive as her ally. They only knew that Sir Edward Grey had used his best efforts for peace; they believed that the Kaiser had made none at all; they had no reason to suppose that at the eleventh hour he shrank from a war for which his General Staff had made all necessary preparations for five and twenty years. It is possible, too, that the Crown Prince and the militarist faction, that believes in war and conquest as the essential engine of German civilization, then gained the upper hand and asserted a malign influence over the Kaiser.

For, alas, injustice breeds injustice. The forcible annexation of Alsace-Lorraine could never be forgotten and forgiven, as Prince Bismarck foresaw it would not be. The French cemented a most unnatural alliance with despotic Russia only because it secured them from further German aggression and gave them a hope of *revanche;* and thus for a whole generation Germany has seen two bitter enemies and rivals reaching out their hands across her to clutch her by the throat if an occasion arose. Her very existence thus menaced, she has been forced to live armed to the teeth. Her corps of officers symbolize and stand for national security, and that is why civilians have brooked their occasional excesses of insolence, even their last year's outrage at Zabern. For the same reason the entire corps of French officers and all "good" society in France went solid in the Dreyfus case with a corrupt, cruel, and fraudulent *état majeur.*

French ambition has of late restricted its aims to a reconquest of Alsace and Lorraine; and for several years after 1870 the Germans on their side merely kept an army to defend themselves; but as their industry and commerce grew, their strategists and statesmen widened their outlook and began to regard their army and navy as means to "a place in the sun." Thirty years ago I can remember Professor Max Müller saying that "he would like to see the German who would wish to go to one of Bismarck's colonies." What German to-day would speak of colonies with such contempt? Our best of foreign statesmen, the late Lord Salisbury, discerned that it was as much in England's interest as in Germany's that the latter should have important dependencies, and for that reason he favored her expansion in Anatolia and Africa; but since his death our statesmen, Lord Lansdowne and Sir Edward Grey, have been too inclined to block her path; and in Morocco the French, relying on our aid, treated her claims—originally created by Lord Salisbury at the Congress of Madrid, in 1893—to a sphere of interest there with scant respect. That was neither diplomatic nor right, and we never ought to have let Germany feel that she was a mere strap-hanger in Europe; for by way of reaction not a few Germans have been overtaken by a positive lust for universal dominion, for conquest *vi et armis* of the domains of others, undeterred by any scruples of right and wrong and justifying force and fraud, after the manner of Bernhardi, with silly sophistries about German culture, as if no race was civilized except their own.

And herein lies the true scandal of modern Germany. By general agreement among the Indo-European races that people Europe and America, one of themselves has no right, after the manner of Sennacherib, to enslave another. There are cases, of course, where old-time conquest has imposed on certain races a political union they detest. Such is the case of Poland. But whereas other states are striving to mitigate such tyranny and recoil in horror from undertaking such conquest, whereas Sweden has allowed Norway to depart in peace, whereas England has conferred on Ireland and on the Boers the measures of autonomy they demanded, whereas even Russia has pledged herself to create a new Poland, Germany alone, through her diplomats, her soldiers and journalists, cynically asserts her right and intention to enslave seven millions of free Belgians, just as in 1864 she enslaved a Danish population and in 1871 the people of Alsace-Lorraine. She alone of modern states affects to treat races that are her equals in culture and her superiors in political development as if they were cattle, merely because Herr Krupp has manufactured big guns with which she can slay them. How in England can we not feel that Germany would, if she could, treat our colonists in New Zealand and Australia as she has treated Danes, Alsatians, Lorrainers, and Belgians, all within a space of fifty years?

Americans are so sensitive on this point that President Wilson only the other day refused to acknowledge as President of the Mexican state a soldier who had climbed into the saddle by use of the sword rather than of the ballot-box. In case—which God forbid—Germany should win in this war, will America tamely acquiesce in her annexation, by means of fire, sword, and rapine, of seven million free, intelligent, and industrious Belgians? If so, then indeed the eyes of civilization are once for all put out, good faith between states is extinguished, and German culture, embodied in the formula *homo homini lupus,* will have triumphed.

Oxford, November 5.

UNTO CÆSAR.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of October 29 an English correspondent, Mr. William Heywood, quoted the following "memorable words" which the German Emperor is supposed to have used in addressing his troops:

"Remember that the German people are the chosen of God. On me, on me as the German Emperor, the Spirit of God has descended. I am His weapon, His sword, and His vicegerent. Woe to the disobedient. Death to cowards and unbelievers."

Mr. Heywood does not indicate the source from which he took these words; he merely refers in a general way to a number of recent books and pamphlets. I more than suspect that the phrases are apocryphal. A German friend has called my attention to a recent issue of the *Frankfurter Zeitung* in which reference is made to these same expressions as having appeared in the Geneva *Tribune,* which in turn attributes them to a Warsaw paper. They are alleged to be part of a proclamation of the Emperor's to the German people. The *Frankfurter Zeitung,* after quoting the passage, remarks that for German readers it has the full charm of novelty. It seems to be simply one of the fables of the time. There is no ground for saying that anything of the kind ever came from the Emperor.

Even the devil has his due; why not the Kaiser? F. W. TAUSSIG.

"PUBLIC AGITATION" BY GERMAN PROFESSORS.

TO THE EDITOR OF THE NATION:

SIR: In the issue of the *Nation* for November 12, Prof. Morris Jastrow, jr., protests against the charge that has been laid against certain eminent professors of contemporary Germany who have been "accused of devoting their splendid talents towards the spread of teachings which brought on the war."

Professor Jastrow assumes that these men are so absorbed in their own lines of work that they have neither time nor inclination to take part in the discussion of current political questions. Of Prof. Eduard Meyer he says: "Those who know the wide scope of Professor Meyer's work in ancient history will agree that a man who has accomplished what he has can have very little time or energy to devote to public agitation." In February, 1913, the International Students' Union of Berlin held a public meeting at which Mr. Norman Angell was the chief guest and speaker. Professor Meyer was not too busy to appear at this meeting to denounce "Angellism" and, according to his own statement, to prevent the students from being led astray by false arguments. After informing the audience, presumably for the purpose of showing his fairness of mind, that he held honorary de-

grees from various British and American universities, he made a bitter attack on England, and then launched into an exposition and defence of Germany's position which from the standpoint of a sympathizer with German "Machtpolitik" left nothing to be desired. The efforts of Britain to bring about a reduction of armaments he attributed to the fact that she was finding the burden too heavy for her, and he closed his address with the proud boast that, for Germany, verily that time had not yet arrived.

That the meeting developed into what an American clergyman who was present declared to be the most disgraceful scene he had witnessed in the course of many years' residence in Berlin was largely due to Professor Meyer, who, according to Professor Jastrow, has "very little time or energy left to devote to public agitation." A. E. Lang.

GERMAN SCIENCE AND GERMAN CULTURE.

To the Editor of The Nation:

Sir: In the recent discussion of German culture, in which the case against Germany appears to be embarrassed by "our debt to German science," I have been waiting for some one who could speak with more authority than myself to raise the question whether, in the first place, our debt to German science is not overestimated. My own prejudices—not racial, for I am remotely of German descent—lead me to look upon German science as a gift of moderate value, certainly of small attractiveness, and of rather *bourgeoise (bürgerlich)* intellectual quality; and the *deutsche wissenschaftliche Methode* seems to me to be largely a method for dispensing with ideas.

To my lay view it seems that, though German science may boast of many great names, it can show surprisingly few of the greatest. The two great epochs of modern science, marked by the conceptions of gravitation and of evolution, were inaugurated respectively by Newton and by Darwin, with Wallace and Spencer—all Englishmen. The law of conservation of energy recalls the names of Helmholtz and Mayer, but equally the name of Joule; and it was Clerk Maxwell who laid the theoretical foundation for the important science of thermo-dynamics. Looking over Whetham's article on "Science" in the new Britannica, I note that the milestones of scientific progress are marked by such names as (to repeat them somewhat at random) Galileo, Newton, Laplace, Lyell, Stokes, Bunsen, Kirchhoff, Darwin, Lamarck, Mendel, De Vries, Huygens, Joule, Faraday, Clerk Maxwell, Helmholtz, Lord Kelvin, Willard Gibbs, and Madame Curie. Allowing for a certain latitude in judgment, it is still hard to believe that the Germans could write the history of science much differently. Altogether, it seems not unfair to say that, while the Germans have contributed heavily to the development of science and to the application of science to practical life, rather few of them are to be found among the initiators of investigation and the creators of scientific ideas; and on the other hand much that passes for science in Germany consists in the application of "method" to regions in which its validity is doubtful.

The present war is supposed to be a test of the *wissensehaftliche Methode*. I have no doubt that it is. Nor do I deny that so far the method has made a good showing. Yet the ideas underlying the more important appliances are few of them German. The Germans have learned to build battleships in England. The automobile has been developed mostly in France. The aeroplane they owe to Langley and the Wright brothers. The first steps in the development of the dirigible are all French, while Santos Dumont may be said to have scored the first distinct success. Their celebrated system of sanitation is built upon ideas supplied by Lister and Pasteur.

It is a delicate task to speak of German culture. I have known and loved too many Germans who were men and women of high character and fine feeling to doubt the fact of German culture in the personal sense; and it is always better not to raise the question as to which of us is better bred. Yet when the question is raised, and the world is bidden to bow before German culture, as before a new Islam, at the point of the sword, it seems proper to place it upon the scale. Leaving aside the relatively small circle of "finely cultivated" *(fein gebildete)*, which is not peculiar to Germany, and taking the nation as a whole as it is to-day, the chiefly striking feature of German civilization (as of German science) is its newness. Among the nations of Europe the Germans are the newly lettered, the newly sophisticated, and, alas! the newly rich; and like others before them they are celebrating their recent acquisition of knowledge and wealth by a display of insolence. Berlin, their capital, though an ancient city, is for the most part as new as Chicago; its growth, which began in 1871, has been precisely parallel and contemporaneous with that of Chicago; and twenty years ago, at least, when I spent a year there, it was for the most part as crude as Chicago, the chief exception being that Chicago was not quite so proud of its "night life" *(das Berliner Nachtleben)*.

Using the word "civilization" in the narrowly material sense, as referring to modes of dress and conveniences of living, the Germans of twenty years ago were at least a generation behind England and America. And the manners of the people, though in some respects better than our own, were naïve. Among German students whom I met, the first question of a new acquaintance was apt to be, "How much did you pay for that coat?" the second, "What is your monthly allowance?" As one German said to me, "Wir Deutsche sind spiessbürgerlich." Yet, unhappily, they were beginning to be ashamed of being *spiessbürgerlich*, and, curiously enough, to seek emancipation through the adoption of things English; the German swell of those days was a caricature of an Englishman. I say "unhappily" because, for my own part, I prefer to let the German stay *spiessbürgerlich*, and personally I found in the older and more Teutonic German a type of character at once attractive and dignified. Yet matters of this kind are not irrelevant in judging the claims of a people to be the leader of society among nations.

Politically speaking, the Germans occupy today the position of England in the time of Charles I; it has still to be decided whether the Kaiser rules by the consent of Parliament. That is to say, in the development of political liberties (surely an important part of civilization) they are at least two and a half centuries behind any of the English-speaking peoples, not to speak of some others. Germany has produced a noble literature, but a literature of rather small compass and hardly to be compared as a whole with the literature of England and France. In the fine art of presenting life in the form of prose fiction, the Germans are distinctly inferior to their three antagonists—the English, the French, and the Russians. One may search German literature in vain for anything to match Tolstoy or Turgenieff, Balzac or Daudet, Thackeray or Dickens.

The Germans are supposed to be preëminently gifted as philosophers—just why, I have never been able to understand; for if the German mind is anywhere lacking it is in that fineness and exactness of perception which is the first essential of good philosophical thinking. I greatly fear that in the minds of those who accept this tradition "philosophy" is typified by the sort of aroma exhaled by Rudolf Eucken, the militarist discoverer of the "spiritual life." It is true that the greatest name in modern philosophy, Immanuel Kant, is German, though some say that it is Scotch—and possibly Hegel may be put beside him. But German philosophy has been feeding upon the past for a generation; it was very lifeless when I studied philosophy in Germany twenty years ago. And Kant tells us that it was David Hume, the Scotchman, who roused him from his dogmatic slumber. The truth is that in philosphy, as in science, those who have disturbed the dogmatic slumbers have been for the most part not German; and Descartes's "Meditations," Spinoza's "Ethics," Locke's "Essay," Berkeley's "Principles," and Hume's "Treatise" hold to-day a more conspicuous place in the history of philosophy than any German document except the "Critique of Pure Reason."

There is but one department of culture in which the Germans reign supreme—in music. Here again the Russian barbarians could be cited to prove that they are not quite alone. Yet we need not deny the creative supremacy of the Germans in the art of music; and—even while the harmonies of Beethoven are being spoiled by the noise of German cannon—I should be the last to underestimate the greatness of the gift which they have bestowed upon mankind or its significance as a mark of culture.

Returning, however, to German science and German scholarship, I think that our debt to German science may be for the most part covered by the idea of organization and method; what the Germans have done for investigation is to organize it. For one, I think that the value of organization may be easily overestimated. In the academic world, where the German idea is represented by the graduate school, the Ph.D., and the laboratory of research, the influence of German "culture" has been somewhat devastating. Where the emphasis is laid upon organization and method, personality and genius are apt to count for little. To the German scientific ideal we owe the fact that so many members of our college faculties are journeyman specialists, not a few of them illiterate, and so few marked by that breadth of accomplishment and of insight which constitutes culture; to the Germans we owe the exploitation of a multitude of new "sciences," all nicely laid out with street names and cement walks, but as barren of content as a real estate speculation in town-lots; and to the German idea we owe the rise of a class of professional organizers, executives, and efficiency men whose only business in life is to mind the business of other people. Wherever two or three are gathered together

to-day, in politics, commerce, industry, education, religion—and even where they are not gathered together—some one is on the way to organize them. In the madness for organization we have long since lost sight of the end in the means; we have forgotten that neither the fruition nor the advancement of human life can take place in the absence of individual freedom and creativeness; and we have come to believe that the sole meaning of life and of culture is—to be organized.

This, I should say, is our chief debt to German science. This machine view of culture is now being tested for us by what is conceived to be the finest organization in existence, based upon the most completely ruthless disregard of the human individualities embraced by it. It seems to me that more than the fate of Germany is involved in the issues of the war; and among the remoter questions, whether the naïve worship of organization is not now to give way to a more intelligent and humane view of life.

WARNER FITE.

Pasadena, Cal., November 11.

MARCEL REYMOND.

TO THE EDITOR OF THE NATION:

SIR: Marcel Reymond, the eminent art critic, died suddenly on October 13 at Lyon. Born at La Mure in 1849, he lived most of his life in Grenoble, spending the summers in his villa at St. Ismier. He studied law, but devoted himself particularly to the history of art, in which his special interests were the art of Florence during the Renaissance, and that of his native Dauphine. He became active in the local movement to attract travellers to this beautiful part of France, and he was the leader in organizing at the University of Grenoble, both in winter and summer, courses for foreign students. In this valuable and successful work, which has now been taken up in all parts of France, the faculty of Grenoble was the pioneer. In recognition of M. Reymond's services, a new auditorium of the University bears his name. He was untiring in his devotion to this cause, and acquired many warm friends among the American and other foreign students. He had formed the interesting idea of establishing a residence-hall for American teachers who might come to Grenoble to perfect themselves in French. One purpose that he had in mind was to promote friendship between France and Germany through the increase of mutual understanding and of fellowship afforded by the University; at the opening of the present war, he must have been saddened to see the nullification of his efforts of many years.

M. Reymond's published works include monographs on the Della Robbias, Donatello, Verrocchio, Brunelleschi, and Bernini; a volume on Grenoble and Vicnne in the series Villes d'art, and one on the Palais de Justice at Grenoble; a volume of art-essays, "De Michel-Ange à Tiepolo." His most important publication is a monumental work in four volumes, "La Sculpture florentine" (1897-1900). The issuc of the *Revue des Deux Mondes* for November 1 contains from his pen an eloquent article, written just before his death, on the Cathedral of Rheims, the bombardment of which seemed to him a crime of unspeakable barbarity. His only son is a captain in the French army.

KENNETH MCKENZIE.

Literature

THE ARCH-PRIESTESS OF MILITANCY.

My Own Story. By Emmeline Pankhurst. New York: Hearst's International Library Co. $2 net.

Mrs. Pankhurst begins her story with the apparently unconscious admission that "those men and women are fortunate who are born at a time when a great struggle for human freedom is in progress"; no one will doubt that when a "struggle" is on she will be eager to be there. The reader who sets out to take her good-naturedly will find the story amusing and entertaining. Mrs. Pankhurst is clever and writes with a facile pen, and she flings forth charges of "duplicity," "mendacity," and "perjury," calls the judges "biassed," Asquith "treacherous," Lloyd George "slippery," and both of them "scoundrels" with a grace and ease that betray practice. The numerous illustrations, mostly of Mrs. Pankhurst at the critical points of her career, serve to demonstrate the thoughtfulness of the militant organization in matters of detail. One must suppose that she never risked an appearance in public without a photographer at her side.

The reader who proposes to take her argument seriously is likely to be exasperated by the constant evidence of a feline sophistry: to begin with, of course, the common feministic sophism, implied in the "emancipation" of women, in which she likens the present situation of women to that of the negroes before the war, and herself to Wendell Phillips. But her whole argument is characterized by a quiet ignoring of obvious considerations and by a cat-like agility in shifting ground. The main object of the book is to show that militant methods have simply followed the accepted traditions of British politics, with the implication that they are now resented because they are employed by women. Thus it is a time-honored custom to break up political meetings and embarrass the speakers by putting questions. Here she fails to note that it is also a time-honored custom, when the questioners cease to be amusing, to throw them out; and that it is no part of the accepted tradition to claim the privilege of "chivalry." In defence of the policy of "obstruction" she points to Mr. Parnell and his followers, who doubtless never expected to escape punishment for breaking the rules of the game. Of course, the "woman's revolution" and the assertion of the right to be treated as "political prisoners" are simply begging the question.

At times she becomes sweetly reasonable. If, now, Mr. Asquith had only named some other time when it would be convenient for him to receive the petition—and so forth. But Mr. Asquith had received peremptory notice that the petition would be served upon him at eight o'clock on a certain evening. Virtually, he had been ordered to be ready and had been threatened if he should be absent. As a matter of course, full use is made of the dramatic possibilities of "forcible feeding." Thus Mrs. Leigh at the door of the doctor's room: "What she saw was enough to terrify the bravest. In the centre of the room was a stout chair resting upon a cotton sheet. Against the wall, as if ready for action, stood four wardresses." Apparently, this is all that she saw. But think of it, four wardresses and a chair, where the only hope of escape lies in ordering dinner!

Says Ellen Key: "The English women have set out from the wrong notion that, because men, driven to political despair, have committed deeds of violence, women also should in cold blood conceive and organize similar outrages." Here we have a clear distinction which Mrs. Pankhurst has apparently never cared to consider. All that she thinks necessary for the justification of violence is (when she conveniently can) to find a precedent. Her justification of arson is very simple: had not arson proved a potent argument in 1832? She passes easily over the statement of Mr. C. E. H. Hobhouse that "in the case of the suffrage demand there has not been the kind of popular sentimental uprising which accounted for Nottingham Castle in 1832 or the Hyde Park railing in 1867. There has not been a great ebullition of popular feeling."

This is the point, the decisive point, which Mrs. Pankhurst keeps dexterously dark throughout her "story," and especially in her attempts to convict Mr. Herbert Gladstone of shuffling inconsistency and Mr. Asquith of treachery. No extraordinary powers of intuition are needed to see that when Mr. Gladstone advised the suffragists to create a *force majeure*, what he meant was a force, not of disorder, but of imperative popular sentiment; and it was as impudent to hold him responsible for the summons to suffragists to "rush the House of Commons" as to pretend (as seemed at first convenient) that the summons contemplated no disorder. As for Mr. Asquith, it is clear from Mrs. Pankhurst's "own story" that he never committed himself to advocacy of the cause of suffrage; but he was prepared to yield if the cause could show sufficient popular backing. There is nothing in Mrs. Pankhurst's book to show that he broke any promises in connection with the Conciliation bill. It seems clear that his promise was, not to support the bill, but only to allow it time for consideration. Nor is it evident to the reader why he was forbidden by his promise to introduce at the same session of Parliament the Government's franchise bill, which was to be open to a woman-suffrage amendment. All that looks suspicious is his failure to foresee that this amendment would be ruled out by the Speaker as irrelevant. Throughout her negotiations—or, rather, her attempts to negotiate—with the Government, Mrs. Pankhurst quietly assumed that she and her crowd were the official spokeswomen of the women of England. The fact is clear, however, from her story that, although she could furnish "demonstrations" at will, she had no warrant either from the majority of

English women or from the majority of suffragists.

The truth is, however, that for moral justification of militant methods, by appeal to tradition or otherwise, Mrs. Pankhurst cares little or nothing. For her the only argument of importance is expediency. Here is her explanation of the policy of burning houses and destroying letters:

> Now our task was to show the Government that it was expedient to yield to the women's just demands. In order to do that we had to make England and every department of English life insecure and unsafe. We had to make English law a failure, and the courts farce-comedy theatres; we had to discredit the Government and Parliament in the eyes of the world; we had to spoil English sports, hurt business, destroy valuable property, demoralize the world of society, shame the churches, upset the whole orderly conduct of life——

In other words, the justification is "militant necessity." In this bland statement Mrs. Pankhurst completes a contemporary trio of distinguished moral obtusities, taking her place beside the German Foreign Secretary who politely pointed to "military necessity" as a sufficient explanation of the violation of Belgian neutrality, and the ex-President of the United States who said, "I took it."

In her foreword Mrs. Pankhurst tells us of the "noble," "generous," and "patriotic" conduct of the militants in laying down arms when war broke out with Germany, and she wonders that the Government, "mindful of their unselfish devotion," has failed to come forward with the proper reward. To take Mrs. Pankhurst seriously at this point would be an insult to her understanding. A tithe of her shrewdness was sufficient to foresee that, when Englishmen were being killed and maimed by the thousand on the field of battle, the fate of a few women who chose wilfully to starve themselves to death would pass unnoticed, and they could quietly be allowed to starve. When war broke out the militant game was over.

Nor was this all. The traditional Philistine argument against suffrage has always been that the responsibility of voting belongs to those who can back it by bearing arms. During the long period of peace the argument had grown rather thin. But the present cataclysm is sufficient to revive it in full vigor. Let the argument be good or bad, it serves to remind us that woman suffrage belongs to an advanced civilization, and presupposes a state of things in which the argument of force is ready to yield to the argument of right and reason. This is something for suffragists to remember. Mrs. Pankhurst to the contrary, women can accomplish nothing by force; all that the militant "warriors" have done has been to take advantage of masculine notions of chivalry. If suffrage is finally to win, it can only be through the appeal to reason, justice, and fair play. And this means that suffragists must not merely play the political game that men are playing, they must play a better game. If the tactics of Mrs. Pankhurst and her militants have been copied from any part of the man-made world, it has been the lowest part. That they might have succeeded, we are not now in position to deny; there can be little doubt that they have served to discredit the cause of suffrage in the eyes of many thoughtful men and women.

CURRENT FICTION.

Time and Thomas Waring. By Morley Roberts. New York: G. P. Putnam's Sons.

The substance of this narrative, as a narrative, may be given in a few words. A middle-aged man undergoes a major surgical operation. It is successful, but the "shock" has an extreme mental or psychic effect of revelation: the convalescent sees life as it is, and himself as a part of life. He has been absorbed in his work as a writer and a recognized authority upon European politics. He now perceives that even work is not the thing for which a man should chiefly live. He has been of testy spirit and manner, and now becomes gentle and understanding. But instead of being converted in the ordinary sense, he has turned from conventional religion to a hopeful agnosticism. "If religions failed when their dogmas perished, the essence of religion remained"—the religion of kindness and of service. Set morality also goes by the board. That Thomas Waring has a mistress as well as a wife no longer irritates his conscience. He takes back the son whom he has cast off for an affair with a maid-servant. He encourages his daughter to become the mistress of a married man. He even begins to understand and to bear with his stupidly virtuous wife. Therefore when he goes back to the operating-table, a few months later, and receives his final quietus, he has at least tasted of life on the right plane.

Now this all looks pretty shaky in the outline, but as the author fills it in, the effect is not intolerable. For one thing, he does not try to make his man out an absolute hero. Waring is not a figure of great strength in either phase of his experience; but he is human, and likable in proportion as he declines from mere respectability and becomes an honest and kindly fellow-being. And these circumstances have their palliations. In his own domestic relations he is a polygamist, not a libertine. His daughter's lover is held to marriage by the technicality of the English law, not by any decree of reason or decency. This whole study of a series of difficult relations is conducted with skill and discretion. Nevertheless, the result is a book of that general type which has been absorbing too much of the energies of recent story-telling Englishmen. Why not take it for granted that convention and respectability are ridiculous things, that questions of sex are many and intricate—and then try talking about something else for a change? Perhaps the present war will do something towards restoring the field of current fiction to the young person. We can afford to sacrifice a good deal of "psychology" and ingenuity for the sake of recovering a little robust commonsense.

Achievement. By E. Temple Thurston. New York: D. Appleton & Co.

The inception of a trilogy would seem to presuppose the inherent largeness of a theme including national as well as personal drama, but there are some English trilogists nowadays who dispense with any such requisite. Give them a story that falls into three convenient sections, they will not grudge the pains necessary to elaborate each into a volume. "Achievement" is the final instalment of such an effort—a small biography on a large scale. The last leg of Richard Furlong's earthly journey is covered with a profound absence of levity, the chronicle being largely taken up with propounding the obvious and faithfully explaining it. The only unexpectedness, pleasurable or otherwise, is introduced by the murder which the hero is finally forced to commit in order to bring his history to a close.

Of the quality of Richard's artistic output there can be no doubt. The felicitous naming of Richard's pictures is strongly relied upon in establishing his preëminence. Take the case of Fanny Cornish's portrait. Where a Whistler would probably have had to content himself with a mere "Arrangement in Black and Green," Richard could manage offhand a double-barrelled tip like "Jade," which directed the attention of art critics exclusively to the laying on of green paint, at the same time that it held in reserve for the more subtly discerning, alert for spiritual significances, all the profound implications of an epithet. In his relationships with women Richard is equally brilliant. He never at any time goes more than three-fourths of the way towards being a knave, and so always deserves the credit of being a decent fellow. Between a wish to be realistically truthful and an ingrained deference for the moral conventions, the author has steered an anxious course. He must not make Richard a saint—he cannot have him a sinner. The result is a puppet rather cautiously operated. The several women who illustrate Richard's experiences with the sex are, all but one, familiar literary types. The exception is the young countrywoman who keeps house for Richard's father. There are passages between her and the soft-hearted old man that convey a clear impression of feminine personality.

Sylvia's Marriage. By Upton Sinclair. Philadelphia: John C. Winston Co.

In "Sylvia" Mr. Sinclair represented a plebeian woman from the West as telling the youthful story of a beautiful Southern aristocrat who in the last chapter was married to a New York multi-millionaire, Van Tuiver. In that chapter a former mistress of Van Tuiver made her appearance as spectator, and let fall an unsavory hint not without its suggestion of tragic effect as it stands, but made merely nauseous as developed in the present sequel. This is a tract about venereal disease and its consequence,

illustrated by the case of the Van Tuivers and their child. It is a subject which needs to be talked about, and is, Heaven knows, being talked about. It might even conceivably be a theme for tragic art, though a theme more difficult than the Borgias or the Cencis have set. Unfortunately, Mr. Sinclair, though a writer of active imagination and of serious purpose, is not a tragic poet. His human figures are no more works of art than those grisly masks and torsos of sexual disease sometimes exhibited in popular "museums" for the education of careless youth—objects of horror, and in some dreadful sense of entertainment. This moral showman has not even such rudimentary taste as might have made his exhibition tolerable. A series of discourses on gonorrhœa and its effects, varied with passages of sentimentalism and even of social comedy!—what more horrid monster remains to be bred of the luckless pair, Fiction and Purpose? There is a penalty: the book is inherently too insignificant to produce more than a momentary qualm. Still, we have an uneasy feeling that we may not have heard the last of Sylvia, her grotesque husband, and their blind child, that some kind of public may wish to hear more of them.

The Captain of His Soul. By Henry James Forman. New York: McBride, Nast & Co.

It is clever and well thought out, an excellent example of the New York story as now written. There are a suitable number of metropolitan types involved, from the stenographer to the captain of finance, and from the ward boss to the millionaire whose name begins with Van. Here, also, are the society adultress and the Bohemian virgin, the journalist, the young reformer; scenes of humor and pathos, laid amid a variety of flats and boarding-houses—above all, in a variety of eating-places, ranging from the obscure French café to Sherry's and the Waldorf; scenes of high-financial stress, with the ticker and the telephone in the foreground; scenes of what the stage calls P-*hash-ion*, and of what brutal youth calls slush. The chief protagonist is a young man who has a triple advantage as a hero in being a Southerner, a Harvard man, and a budding author. He comes to New York full of ideals, and singularly ignorant of the mass of literature extant which deals with youth so situated. He has to learn painfully for himself, as one blazing a trail, that the college writer of "promise" does not easily fulfil himself in the New York market-place; that one cannot serve God and Mammon; that wine is a mocker; that smart life is a hollow sham, and finance another; that service is best, and a good woman worth many rubies. All these truths are here laboriously rediscovered. So, indeed, they must needs be rediscovered by each fresh generation of young comers. But, if we are to maintain our interest in that perennial experience, it must be presented to us with fresh force and reality. What we have against the young gentleman of this narrative is that he has so little basis of character for circumstance to work upon. The author fails to make us believe in him—or, at least, to make us care about him. Nor is that wonderful maiden named Mary—however "Maryish"—so important to the reader as she apparently is to Mr. Forman. She, like the story, is a thing made, not a thing created. Despite the deepest conscientious inhalations and exhalations of the author, the breath of life, the inspiration, is not here.

The Pastor's Wife. By the author of "Elizabeth and Her German Garden." New York: Doubleday, Page & Co.

In this photographic description of life in a small village of East Prussia it is almost startling to recognize names of places which now appear daily on the first pages of newspapers. Countess von Arnim's gift is for characterization and minute and sympathetic observation of the life around her, rather than for plot and incident—although it is true that in "Princess Priscilla's Fortnight" she crammed more of incident into fourteen days than usually occurs in the lifetime of a well-brought-up young lady of royal birth. There are both plot and incident in "The Pastor's Wife," but both are too extravagant to create, we will not say credulity (which is not necessary), but even temporary illusion. The value of the book is in the scenes that portray the life of an English girl married to a German pastor in a small East Prussian village.

The attitude of the author in her latest work is different from that which gave so much charm to "Elizabeth and Her German Garden" and "The Benefactress." The description here, we feel, is faithful, almost pitilessly realistic, but in place of the sympathy with her surroundings which marked the author's earlier work, we seem to notice a tinge of bitterness in the ruthlessly exact picture she draws of the daily routine of the Prussian *Hausfrau*, the incessant breeder of children, who represents the Prussian ideal of married womanhood, of woman's place in the economy of the state. The keynote of what Countess von Arnim has to say is found in the final protest of the pastor's wife, which precipitates the crisis of the book: "Oh, don't you see all that will be in ruins about us—but in *ruins*, Robert—all our happy life—if I go on in this—in this wild career of—of unbridled motherhood?"

They Who Question. Anonymous. New York: The Macmillan Co.

This comprehensive representation of the life of a better-class English family interested in social endeavor is quietly religious and impressively sincere. The author attempts a philosophical problem, some phases of which he evades, and some of which are treated superficially—the problem of the place of suffering in every-day existence; but lack of depth is atoned for by many positive merits of style and characterization. Galsworthian sentimentality plays no part in the story, even in depiction of the most sordid elements of London life. "To many minds," states the author in one passage, "the prevailing element in East London is its sadness, and people hardly seem to realize how many happy lives are spent there. Whitechapel Road on a warm summer evening, with its gas lamps, its venders of fruit and fried fish, its groups of people chatting on the pavement, may not seem a particularly favorable or delightful place to a man who has spent the afternoon sitting in a green chair in the park, but then a chair in the park may not strike the East Ender as altogether an amusing or delightful spot. A crowd, looked on as a whole, will probably always convey a suggestion of sadness with it. . . ." This same sanity is brought to the relation of a long chapter of family ills—sickness, crime, and even madness; and it is responsible for some admirably humorous scenes—one of rustics reminiscent of George Eliot's Loamshire folk, several of Dickensian crowds in the streets. In the treatment of two or three individuals, whose reactions and adjustments to the ills spoken of are the theme of the book, the author has succeeded in sympathetic characterization. The confession of the philosophic doubter at the end that his road is a blind and dark one beside that of faith is a natural and not a strained climax.

LETTERS OF A DOCTRINAIRE.

The Letters of Richard Henry Lee. Collected and edited by James Curtis Ballagh. Volume II: 1779-1794. New York: The Macmillan Co. $2.50 net.

The present volume contains Lee's correspondence for a period of fifteen years; but the bulk of the letters were written in the years 1779-1781, 1784, 1785, and 1787-1790. The Lee-Deane controversy swells the correspondence of the first three years to 266 pages. Many of the letters of 1784 and 1785 were official letters which Lee wrote as President of Congress; while during the period from 1787 to 1790 the work of the Federal Convention was the occasion of many long communications. The second volume reveals the same excellence, in respect to the work of the editor, that was noted in the review of the first volume (*Nation*, September 11, 1911).

Von Sybel says of the Girondins that they attracted those for whom the Feuillants were too lukewarm and the Cordeliers too dirty. Certainly the Girondins were nothing if not fastidious and cleanly. They lived, not so much in the real world of Paris, as in an ideal state reconstructed from classical tradition and suffused with humanitarian sentiment. Their devotion to liberty was a literary enthusiasm; and if they invited martyrdom it was partly to prove that the spirit of Regulus still lived. But in the presence of Marat or Santerre, or even of Danton, they were extremely uncomfortable.

The American Revolution was not without its Girondins; and Richard Henry Lee, although he had a much firmer grasp of realities than Madame Roland, or men like Vergniaud or Gensonné, possessed many of their

characteristics. He spoke their language, and he spoke it well. His oratory was finished and studied—a contemporary called it "elegant." He has the Girondin air of loving liberty because he had studied the classics. Faithful to Roman tradition, he christens his son "Cassius," and takes it as a good omen that at five months the youngster "seems to look as if he would be no lover of tyrants." What a powerful influence, indeed, had that word tyrant upon the minds of those literary radicals who loved their Plutarch! Forgetting its original meaning, they transformed all kings into tyrants and all tyrants into oppressors of the people. Over against all monarchical and aristocratic systems, conceived as the essence of political evil, they set an idealized Republic, whose vital principle, as Montesquieu had assured them, was *virtue;* a system which, by necessarily uniting all good men in opposition to all bad men, would therefore secure the happiness of mankind.

A clear-cut political philosophy like this was not ill suited to Lee. He had not a subtle mind, and was little given to introspection or the analysis of another men's motives. But he was proud and ambitious, yet withal of generous impulses—such a man as must needs serve a cause, not himself, that makes for righteousness. The conventional phrases of that age, which sound so hollow to our jaded ears, Lee employs with all the irritating complacence of the true *Philosophe*. And with entire sincerity. When he says, "The principle of republics being virtuous, and their conduct therefore squaring with justice," he is laying down a proposition which represents an ascertained and proved reality. He is not insincere, but only doctrinaire—one of those for whom politics is no mere practical art of composing conflicting interests, but a struggle for the unconditioned good against the powers of darkness.

It was this sense of being enlisted in a holy war that gave to the Revolution in its early stages a semi-religious character, and inspired the patriot party with that amazing assurance with which it entered into a conflict which must otherwise have seemed hopeless. Whatever the difficulties might be, so righteous a cause, it was thought, could not fail. "It is impossible," Lee writes to Washington in 1775, "that vice can so triumph over virtue, as that the slaves of Tyranny should succeed against the Assertors of Liberty and the just rights of humanity." The sentence reveals a splendid optimism, which is the prevailing tone of the letters during the early years, and which is one of the secrets of Lee's great influence. But Lee was one of those leaders whose influence declined during the war. The real struggle was so different from his conception of what it should be, from what it was to have been, that he could not readily adjust himself to it. Better acquainted with mankind than with men, he was not prepared for the waning enthusiasm, the sordid motives, the low intrigue, which were so apparent on every hand. He was amazed to find that true *Virtue*, the very foundation of his ideal republic, was rare indeed even among those who professed to serve the cause of liberty. The optimism of the first years, therefore, gives way to a certain disillusionment, a sense of betrayal, so that in 1779 he is in "despair of seeing virtue encouraged and protected, or vice frowned upon and punished." Lee never quite gave up the battle, but if he still stands at Armageddon it is with a less resolute courage, a less confident faith.

BUSINESS AS A SCIENCE.

Scientific Management: A Collection of the More Significant Articles Describing the Taylor System of Management. Edited by Clarence Bertrand Thompson. . Cambridge: Harvard University Press. $4 net.

One of the difficulties confronting the man who would acquaint himself with the subject of scientific management has been the lack of a concise survey wherein he could find some definition of the term, some record of the successful application of this form of management to different industries, and a review of its origin and development both as theory and practice. A considerable literature has grown up about the subject; but most attempts at popularizing it have been condemned as shallow and misleading by prominent followers of F. W. Taylor. On the other hand, those books and articles which are authoritative deal for the most part with some particular phase of scientific management, or with some specific application. In a word, a suitable introduction to the bibliography of the subject has been lacking. This lack Mr. Thompson supplies to a considerable extent in his book.

In justice to him, it should be said that he does not state this as his purpose, saying, rather, that the volume is to serve as a supplement to the classical authorities: Taylor's "Shop Management," "Principles of Scientific Management," and "The Art of Cutting Metals," and Gantt's "Work, Wages, and Profits"—bringing them up to date, defining some of their terms more closely, and giving further insight into the development of scientific management as a theory, following its prior development as a practice under varying conditions. Furthermore this book is not a popular treatise, but consists of articles gathered from many sources and excerpts from the best books. Consequently it preserves the style, point of view, and interpretation of the original authors, whose purpose was not to write a popular treatise, but to converse with the reader as one scientist with another, largely in technical terms; either to instruct or to convince. Mr. Thompson calls them into court, as it were, to answer in their own words "a widespread demand for more detailed information regarding certain phases of scientific management than is given in these books" (Taylor's and Gantt's). He says, in another place, "The text and notes together cover nearly 90 per cent. of all that has been published on the subject in English." This statement, together with the twelve-page bibliography at the end of the book, indicates both the magnitude of Mr. Thompson's task and the debt owed to his patient and thorough sifting of the material. He has presented a library of the subject in 878 pages.

If read at all, the book should be read carefully page by page, from cover to cover. It is not for hasty skimming and sudden conclusions. The editor remains strictly an editor, he does not raise an issue or point a conclusion. But by selection and arrangement he achieves his purpose. That is, he brings out the lack of general knowledge of the subject, the confusion of terms responsible for some perhaps unjust criticism, the mistaking of the tools or of the formulæ for the thing itself, which has led to many failures, and the non-existence of agreement as to the relative value of different methods, practices, and principles involved in or related to the complex known as scientific management. Thus, as we read attempts at general definition by the author himself, by Forrest E. Cardullo, Henry P. Kendall, F. W. Taylor, Lieut. Frank Sterling, and others, we are struck by their dissimilarity, because, for the time being, one is thinking of the historical aspect, another of the logical; one of the practice, another of the theory; one of the general, another of the specific. But by including them all within our vision and getting them in perspective, we note a most impressive agreement on such essential questions as the following:

(1.) That the mental attitude of the managing executive is the most important single consideration—unless the responsibility is wholly delegated to an individual who has the correct attitude. The latter alternative, however, is not in accordance with Mr. Taylor's conception, which was a literal understanding of the words "scientific management" by those who ought so to manage, namely, the executive heads of the business. The significant point is that while these men regard scientific management in the business sense as a method of stimulating output, lowering cost of production, increasing wages, and improving the product simultaneously, they insist that it can only be done successfully by those who add the right motive to the method—*e. g.*, they must really *desire* to improve the product and accord fair treatment to the worker. This mental attitude further involves a willingness to learn, and to put operation on the basis of scientific determination of facts, accumulation and analysis of data, and the subsequent creation of standards, systems, methods, and so on—in a word, the substitution of exact knowledge for fallible judgment, as Forrest E. Cardullo says. Later in the book James M. Dodge gives very interesting testimony to the value of this change of attitude through the introduction of the Taylor system into the shops of the Link-Belt Company.

(2.) That there are two important aspects of scientific management, one involving the human equation and applying to the mental attitude of employers and workmen, se-

lection of the right men for various duties, teaching, incentives, and so on; and the other involving a system of functional organization, time study, reports, printed forms, teaching methods, arrangement of plant, machines, and work, and many other elements. This latter aspect is the one most familiarly known as scientific management, but it is the skeleton of which the former is the spirit. Furthermore, this second phase is not a ready-made framework for any business, but must be adjusted to fit the body by time and hard work. Its elements are characteristic, but are secondary to certain principles which it would be out of place for us to define, and which the writers quoted assert must be learned by study and practice.

These various elements are, however, made the subject of separate chapters and treated in detail. Kendall is quoted on the functions of management in relation to unsystematized, systematized, and scientifically managed shops; the planning department is discussed by Hathaway; foremanship by an article from *Industrial Engineering;* slide rules by Barth; the graphical daily balance by Gantt; the tool-room by Kent; time study by Hathaway, and so on. A valuable chapter on Classification and Symbolization is contributed by the editor. Other articles deal with actual installations, wage systems, and relations to various labor problems, applications of scientific management to machine shops, railways, general business, retailing, women's work, etc. We could wish that more space had been given to standardization, relation of shop management to sales work, selection of employees, effects of scientific management upon plant equipment, arrangement of work, and other factors of efficiency. However, the book as a whole gives one an exposition of scientific management by those who are entitled to speak for it.

THE MAN WHO SAVED CALIFORNIA TO SPAIN.

Junípero Serra: The Man and His Work. By A. H. Fitch. Chicago: A. C. McClurg & Co. $1.50 net.

If the Russians had owned the Pacific Coast down to Mexico it is not likely that they would have parted with the rest of it for a song as they did with Alaska, and one can easily imagine the complications that might have resulted to the United States. Fortunately, Spain owned our California for half a century; yet the conditions were such that she would have surely abandoned it, leaving the coast open to the Russians, had it not been for one man, a Franciscan friar, Junípero Serra, through whose herculean and indefatigable efforts the scale was turned repeatedly when the Spanish authorities in Mexico were about to give up this inaccessible region, at a time when it took almost as long to sail from Mexico to Upper California as it did from Spain to Mexico. This national importance of Junípero Serra as the preserver to Spain, and thereby indirectly to the United States, of the Pacific Coast, from San Diego to San Francisco, surely entitles him to the honor of a special biography, such as Mr. Fitch has now made of him. It is true that a "Vida" of the great missionary by his companion, Francisco Palou, was printed as long ago as 1787 and is now accessible in an English version; but the main object of this biography was to procure for its object recognition in the church as one of her saints. On the facts and interesting details presented in it, and on the same author's "Noticias de la Antigua y Nueva California," Mr. Fitch had to build his book, but from many other sources he has gathered an abundance of illustrative material which enabled him to make a true story read like a romance, and bears out the contention that biography leaves on the mind a more definite impression than any other form of historical writing.

Religion was the one absorbing passion of Serra's life. He had all the traits of a mediæval saint, including the passion for self-torturing, with which he awed his congregations. His bed consisted of a few planks, his food of the simplest viands that would sustain life. Though always frail in body, he made journeys of hundreds of miles on foot through deserted or perilous countries. He envied those of the missionaries who died the death of martyrs at the hands of savage Indians, but was fated to die on his planks at the ripe age of seventy-one. His aim in life was to save the souls of Indians, and when his license to confirm expired he had administered the sacrament to 5,036 persons and had baptized 5,800 Indians. Better than any one else, he knew how to allure the savages to his church, attracting them with food and clothes, and thus gradually gaining their confidence and faith. He personally taught the men to till the soil, the women to sew and cook. Of the daily life in the missions Mr. Fitch gives a graphic account, as well as of several encounters with hostile savages. Incidentally he presents some enticing pictures of fertile, lovely California, with its marvellously varied scenery and climate—a climate in which, at least in some regions, even fogs are healthful and exhilarating. Perhaps the author exaggerates the artistic value of the mission buildings, the ruins of which naturally interest all tourists for religious, sentimental, and historic reasons. He dwells not only on the hardships naturally endured by the missionaries as pioneers, but on their struggles with the military authorities who tried to wrest from them their prerogatives. And their leader in these contests was always Junípero Serra.

In short, one cannot but agree with the author that the early history of Upper California is the story of Serra's life. "He was the heart and soul of the conquest; whatever was done to further the cause of civilization in California during his life, was done by him. He had brought into existence nine missions, four presidios, and two pueblos."

Notes

J. M. Barrie's thumbnail sketches of Kirriemuir folk have been so well utilized by the artist, A. C. Michael, that it is pleasant to welcome a reissue (Scribner; $1.50) of his edition of "A Window in Thrums," with colored illustrations. The pictures of the native humorists and of simple domestic scenes are in harmony with the narrative, and have almost as much the air of having been studied from the life as has Barrie's inimitable talk. Of simple sincerity are also most of the illustrations which another English artist, George Wharton Edwards, has contributed to a rather commonplace book of travel from his own hand, "The Forest of Arden" (F. A. Stokes Company). The text was written to fill up the pages between the plates, obviously; and the author did not count on the new interest which now attaches to the picturesque country between Luxemburg and Liège. Some legends of Arden, gathered at first hand, fill out the book. Of more substantial literary quality is Edwin M. Bacon's "Rambles Around Boston" (Little, Brown: $3.50), with drawings by Lester G. Hornby. The book, if it occasionally lapses into guide-book preoccupation with thirty-three facts, displays an amazing amount of interesting antiquarian information, and the unassuming sketches are frequent enough to make visualization easily possible.

The title of Sinclair Kennedy's book, published now by Longmans, Green & Company ($1.75 net) when the question of race and nationality is so much in men's minds, but written before the present crisis, is "The Pan-Angles," its sub-title is "A Consideration of the Federation of the Seven English-Speaking Nations"; its ten chapters develop the argument implied in these phrases, with much force of historical illustration, but also with a deal of unnecessary repetition. Like most books with a thesis, it is three times too long, unless writers are bound to assume that endless reiteration is the only sure means of impressing the public. The seven nations considered are New Zealand, Australia, South Africa, Newfoundland, Canada, the British Isles, and the United States. They "hold in actual or allied control lands amounting to sixteen million square miles, with a population of five hundred and thirty-five million people, or thirty and thirty-three per cent., respectively, of the entire surface, and the entire population of the world. . . . In these seven nations more than one hundred and forty-one millions are white people, nearly all speaking the same language, and all enjoying individual liberty of substantial equality." Now those who understand the influence of words on practical affairs will immediately recognize the force of the fact that we have no single accepted and convenient name for this great body of men who, whatever may be their national differences, certainly have large sympathies and some interests in common. Whether Mr. Kennedy's suggestion of the name Pan-Angles will win a place for itself or not in general usage depends on many chance circumstances. It is not pretty, but it is convenient; and it at least calls attention to a need that has long been felt and often expressed.

Mr. Kennedy's plan for a federation of

these seven nations carries us into more dubious matters. Yet, historically considered, it is in no sense new or startling. For many years there has been a good deal of talk about some sort of parliamentary alliance among the six Britannic peoples, though the word empire has been in men's mouths oftener than the word federation. Nothing very tangible in the way of governmental forms has come of this talk, but it has probably had direct results in the increased solidarity of the Empire as shown in the present crisis. A federal alliance between these six nations and the United States is, no doubt, for the moment at least, hard to conceive. Yet it is a fancy, after all, not without support in history. A federation of England and America was the dream of Franklin, a man practical enough in all conscience, though fate was against him then; and Governor Pownall, one of the wisest of the British colonial administrators, cherished the same hope. The Revolution put an end to such plans for many years, perhaps for ever; but natural sympathy and understanding mean much in international relations, and these have recently shown a remarkable power of increase, a strength, indeed, of which we were scarcely aware until our eyes were opened by the shock of the European war.

To discuss in sober seriousness such questions as Mr. Kennedy has proposed for solution is to lay oneself open to the charge of folly and impertinence; it is like trying to converse on equal terms with Destiny. But his method of approach is conciliatory. He speaks little of race, and much of language; and certainly the great binding force among men is in their speech, rather than in their blood. The Pan-Angles are composed of many races and are likely in time to grow even more heterogeneous in this respect, but if they continue to speak the language of Shakespeare and Milton, of Burke and Lincoln, they are bound to be held together, and to become more and more one people, by the all-conquering attraction of ideas. So also Mr. Kennedy is wise in offering no definite scheme of federation. His nearest approach to such a scheme is the proposal, tentatively thrown out, of a common flag and a federal capital. The latter he places preferably in a neutral spot between Canada and the United States, and it must be admitted that this touch of precision seems immediately to throw the whole question into the realm of Utopian speculation. It is not likely, of course, that such a book as this will have any immediate and practical effect, beyond enraging a few Irish and German Americans, but its appearance is nevertheless a sign of the times, and deeply significant.

The principal objection to Will S. Monroe's "Bulgaria and Her People" (Boston: The Page Co.; $3 net)—and at the same time something of a recommendation, perhaps—is the fact that, instead of writing his own opinions, he has chosen to clip his data baldly from official reports and the standard works of reference. As a result of such methods, he has prepared a work which is rather more authoritative than the usual travel-book, but he has paid a heavy price in loss of personal interest and first-hand observation. He deserves special commendation, however, for interesting chapters on Bulgarian Folksongs and Music, Modern Bulgarian Literature, and Painting and Sculpture. The first two of these fields especially are deserving of wider study than has yet been accorded them. As a rule, the author seems to be accurate in his statements, but he errs in asserting that Aleko Constantinoff's notable satire, "Baï Ganio," has never been translated into English. Chapters on the recent Balkan wars will be found satisfactory, if somewhat pro-Bulgarian. It is to Professor Monroe's credit that he has gone for his data on this phase of history to the Carnegie Commission's report. The illustrations are copious, and there are several satisfactory maps.

In "Charles Stewart Parnell" (Holt; $3 net), by his brother, John Howard Parnell, we have a family memoir of a most engaging kind. One must not look in it for the philosophy of the Irish Home Rule movement, or even for accurate political history. The author, who is now upwards of seventy, writes from memory, and falls easily into errors in the matter of dates and the connection of events; but he does give us an uncolored though loving picture of the Irish leader in habit as he was at home. The simple affection of the narrative may be inferred from the fact that throughout the book he speaks of Parnell as "Charley." And upon the latter's inner nature and the springs of his public action he throws a great deal of direct light. To single out only one trait, he lets us see that Parnell's glacial calm was partly character, partly calculation. Once when he passed his brother in the midst of an excited crowd, through which Parnell was moving with an air of kingly indifference, the latter slyly gave John a fraternal wink. It was as much as to say: "See how well I am playing my rôle of utter impassivity!" The most audacious display of this was at the time when Parnell, at a great public meeting, received the £40,000 which the Irish people had raised to free him from pecuniary embarrassment. He took the check, quietly folded it, and put it in his pocket, and made not the slightest reference to it! Significant details like this dot the unpretentious volume, which, for its unaffectedness and very innocence, is of an interest and value beyond what can be found in many a more ambitious book.

With a typically incongruous turn, Mr. Simeon Strunsky entitles his latest volume "Belshazzar Court, or Village Life in New York City" (Holt; $1.25 net). Readers of the *Atlantic Monthly* will recognize most of these "field notes" on the New Yorker in his apartment house or on the street, in the theatre or at the baseball park. To the cosmopolitan these covertly serious essays will present a humorous picture of life as it is endured in Manhattan. To the Gothamite they will seem a brilliant review of familiar but unregarded phases of his own existence. For they are indeed packed with shrewd, often penetrating, observation of public manners and homely customs. Most readers may be more taken with the writer's fresh, quaint, witty, or hyperbolical way of putting things, since he has made his chief bid for popularity as a humorist. He has, to be sure, a sharp eye for the inconsistencies and insincerities of both our conduct and our ideals, and it must be conceded that there is seldom a dull page in all his wandering remarks. But his pleasantry is not the jolly English humor of eccentricity, with laughter holding both his sides, nor is it the hearty American humor of exaggeration, artfully leading up to some surprising or grotesque conclusion. It is an intellectual humor that plays around ideas, finding an unexpected truth in apparent absurdity. In all likelihood, therefore, the discriminating conner of Mr. Strunsky's paragraphs will set greatest store by the restless light of reason that flashes upon or lingers about every topic considered. By Matthew Arnold his lucubrations would surely be pronounced literature, for the criticism of life is always just beneath the rippling, eddying surface of the style. His is far from being the easy paradoxical scintillation of the social revolutionist. On the contrary, the author plays the doubting Thomas with regard to most of the educational, theatrical, and other fads with which our progressive age is rife. He even complacently pokes fun at Bernard Shaw—with roguish inconsistency, seeing that in his own volume the pages have to be cut at the bottom. In fine, the rare quality of the book is not so much the humor as the suggestive quality of the thought.

Undertaken, at the request of the present Duke of Marlborough, as a biography of "the imperious Sarah," Mr. Stuart J. Reid's "John and Sarah, Duke and Duchess of Marlborough" (Scribner) was "expanded, on second thoughts," as the author tells us, "to cover the career of John Duke in the years of his unequalled military ascendency." In the introduction contributed by the present Duke, we learn the true object of the work, to wit, "a complete vindication of Marlborough . . . a reopening of the question which Macaulay regarded as settled forever," and a "more sympathetic consideration of the political ideas of the man who was the villain of Macaulay's piece." The book, then, is in the nature of an *apologia,* and it is much more candid and vastly better written than most of its kind. As regards the necessity for the work, it will at once occur to the reader that the verdict of the great Victorian writer has been long since discounted. As John Stuart Mill put it, Macaulay's volumes might be pleasant reading, but they were not exactly history. Nevertheless, although the book may contain little that is absolutely new, yet it presents, in compact form, certain facts, well attested by contemporary evidence, that go far to set a great national hero right in the eyes of his countrymen, at a time when new national heroes are in the making. The two principal aspersions on the Duke's character are imputations of interested disloyalty and of inordinate ambition—nothing less than an attempt to prolong the war for his own selfish ends, and a design to make himself dictator and even to succeed Anne on the throne. According to our author, Marlborough's apparent habit of having a foot in either camp is explained by his loyalty—not to any one person, but to the Protestant religion as essential to the welfare of England. There is, indeed, much in the documents quoted to bear out this contention, though efforts to transfer the halo of "Protestant hero" from William to the Duke may well provoke a smile. His private letters to his wife, replete with his weariness of the war, amply dispose of the second accusation. As for Sarah Duchess, in spite of some new and not uninteresting matter from the Blenheim papers, she remains, at the end of the story, much as we have always known her. The old imputations on her honesty and virtue have been long since disproved, and she

still looms from out the past, a woman of great parts marred by excess of "temperament." Had the book been, as at first intended, merely a biography of the Duchess, it would probably not have been worth writing. As it is, it is distinctly worth reading by any one interested in the political history of the times, and in the life and character of the dominant figure in a critical period of the annals of England.

Mr. A. S. Crapsey's book, "The Rise of the Working Class" (Century; $1.30 net), is little more than a translation of Marxian Socialism into that fervid language which enshrines so much of the modern product of uplift and "new thought," although it is but fair to say that this particular specimen is above the average so far as style is concerned. As a statement of this particular *Weltanschauung* "The Rise of the Working Class" will undoubtedly please a good many people who do not already know their Marx and who like to read their economics, their science, their philosophy, and their religion as they run. The author's dogmatic method of treatment, the sweeping grandeur of his generalizations, the entire "modernity" of his point of view (evidenced particularly in the chapters on Working Class Religion and Working Class Morality), and the hortatory tone in which all is expressed should appeal to that part of the public which is intolerant of the sustained mental effort that is necessary in the case of ordinary economic reading.

The attempt of Herbert A. Smith to formulate "The Law of Associations, Corporate and Unincorporate" (Oxford University Press; 6 shillings net) was worth making, albeit the author, at the outset of his task, expresses doubt of its success, and at its close admits his achievement of "only negative results." His attempt is not quite as novel as he fancies it to be. In at least one American law school, a similar venture has been in progress for a number of years. The law of corporations is not dealt with as a body of rules entirely distinct from those making up the law of partnership. On the contrary, the view is maintained, that sound juristic theory requires the development of a law of associations, which shall include every form of group action—every case where two or more persons are associated together for any kind of lawful activity. How successful this venture has proved, the writer cannot say; but he has not discovered any publications by the apostles of this doctrine which have sensibly affected, much less revolutionized, juristic thought. One of the best chapters in this essay is that on Criminal Liability. Only a small section of it is devoted to the criminal liability of partnerships, clubs, or other unincorporated associations, and the results of this part of the discussion are not only negative, but negligible. These group-forms do not commit crimes as groups, and are not indictable as groups. The criminal liability in such cases is that of the individual members of the groups. On the other hand, the corporation may be indicted for criminal misconduct and punished therefor, although its officers and agents may also be answerable individually in criminal proceedings for the corporate misconduct in which they have taken part. Certainly, this chapter contains nothing to sustain the thesis that there is a body of common legal principles governing the various forms of associations. Indeed, it is difficult to believe that any one can rise from the perusal of this essay with the conviction that the law of corporations, the law of partnership, the law of clubs, and the law of domestic relations can be synthesized into a law of associations.

Prof. William M. Sloane's "Party Government in the United States of America" (Harper; $2 net) is, in the main, a translation and revision of the lectures given in German at Berlin and Munich, in 1912-13, while the author held the Roosevelt professorship. The lectures, based frankly upon the works of Johnston, Bryce, and Ford, cover rapidly the constitutional period, and do not show particular excellence in purely historical matters. From the point of view of parties and party development, however, the book is distinctly stimulating, not infrequently exhibiting keen insight and exceptional powers of generalization and interpretation. These latter qualities are most noticeable when the author comes to deal with the period since the Civil War; for while the mere historical narrative, it must be confessed, becomes increasingly a catalogue of events, the broader lines of party activity, the formulation and execution of party policies, the influence of personal leadership, and the frequent contrast between public opinion and party action are as a whole strikingly elucidated. Professor Sloane is refreshingly free from illusions and prepossessions. He touches with equal firmness and courage the weaknesses of Jefferson, the substantial merits of Van Buren, the solid qualities of Cleveland, and the political inconsistencies of Wilson. Yet we cannot help wondering what impression the German audiences which first heard these lectures formed of American politics and American government. Professor Sloane's skilful omission of what is merely local or provincial in our national annals helps the picture as a whole, at the same time that it hardly disguises the fact that, from the European point of view, American parties and party leaders have often been curiously timid and parochial, that legislation has often responded but slowly to public opinion, and that leaders in the Federal sphere have often shown slight conviction of what they wanted to accomplish. Lord Bryce's famous remark that Americans excel other peoples in their skill in making the best of bad conditions tells a good deal of the story, after all. We do not say this in order to disparage Professor Sloane's interesting book, but only to suggest that it is time some equally competent and thoughtful writer, surveying the whole field of our political development, pointed out how American government can perform its great tasks with appreciably more certainty and consistency.

One would have said that it would be impossible at this date to write a book about golf that could make even a pretence to novelty, but Henry Leach has come pretty near doing it in "The Happy Golfer" (Macmillan; $1.75 net). It is an agreeable mélange of story and advice, travel and description. Few can have made pilgrimages to so many distant links as this Englishman. He includes the courses of Italy and Spain, and has played on the most notable ones of the United States. To the latter, indeed, he devotes the major part of his volume. On the whole, he says a good word for American golf. Especially of our clubhouses does he speak with something like envy. He refers to the long railway rides between links in this country, but at one point he must have been misled, or else have got his notes mixed. On the way to Chicago he went into his sleeper after passing Albany, about ten o'clock, and "was just falling into some sort of doze in the small hours of the morning when the train pulled up sharply at a station which I discovered to be Schenectady, where the famous putter that disturbed the peace of two nations was born." That must have been the longest seventeen miles ever travelled.

NOTES FROM ABROAD.

When the war is over, constitutional lawyers will have an interesting task in sorting out and annotating the innovations that have been made in British constitutional practice during the emergency. Prof. A. F. Pollard has called attention to one that might otherwise have escaped notice. The Prime Minister has been questioned as to the status of two British peers, the Dukes of Albany and Cumberland, who are also German dukes, and are now in arms against England. He has explained that, since the war began, no "writs of summons" have been issued to these two peers. This has an important bearing on the much-debated question whether a seat in the House of Lords depends technically upon heredity or upon the receipt of a writ of summons. The effect, however, of a series of decisions by the House of Lords itself has been to deprive the Crown of all discretion in the issue of writs to persons entitled to peerages by heredity. Professor Pollard points out that the recovery and exercise of this discretion by the Crown is a matter of some constitutional importance.

For the most grewsome illustrations of what war really means one must turn not to the rhetorical descriptions of special correspondents, but to the matter-of-fact technical reports appearing week by week in such professional organs as the *British Medical Journal*. That paper mentions, for instance, that a London hospital has under treatment cases of mental derangement in officers who have suffered no bodily injury. One acquires a new sense, too, of the effect of modern artillery from accounts of serious results—deafness, dumbness, and nervous troubles—due to the mere concussion of the air when shells explode. From the same source we learn that the infections of wounds in Belgium and northern France are of a character hitherto unknown to British bacteriologists. The soil in these intensively cultivated districts has been thoroughly manured for an untold number of years, and teems with tetanus and other anaërobic organisms. Men stand for hours in trenches dug out of this soil, and get their hands and clothing caked with mud. Consequently the wound and the infection are caused simultaneously, for every missile that hits a man carries it with it millions of anaërobes.

Alessandro D'Ancona, Senator of the Kingdom of Italy, and for fifty years professor of Italian literature in the University of Pisa, died on November 8. He was born in Pisa in 1835, and received his early education in Florence; as he himself has said, students of Italian literature at that time had to be their own teachers. He engaged in literary and journalistic work, and took part in the

political movements leading to the war of 1859. In 1860 he became professor at Pisa, and he retained this position until forced by advancing age to resign. His publications, noteworthy no less for their quality than for their number, cover all phases of literary history. Several of them are standard authorities in their field, such as "Le Origini del teatro in Italia" (2d edition, 1891) and "La Poesia popolare italiana" (2d edition, 1905). The memorial volume dedicated to him in 1901 enumerates 724 of his publications; the list would be much longer today. His style is charming, his scholarship both broad and accurate, his criticisms, like those of Gaston Paris, are remarkable both for their learning and for their urbanity. In 1893 he founded the *Rassegna bibliografica della letteratura italiana*, which he edited until 1910, being succeeded by his pupil and colleague, Francesco Flamini. He recently revised and collected many of his important earlier writings, such as "Scritti danteschi," "Studi di letteratura popolare," etc. He was an honorary member of the Modern Language Association of America, and his name is familiar to all students of Italian literature.

JUVENILE BOOKS.—II.

We never quite lose recollection of early enthusiasms, and so it was that we found ourselves rooting among the pile of books on our desk for Douglas B. Armstrong's "The Boys' Book of Stamp Collecting" (Stokes). And there was certain juvenile zest left in us for the subject. Here is a manual written from the English standpoint, but none the less significant to the American enthusiast. How stamps are made, how their value is determined, and many other fascinating topics are treated by the author of this fully illustrated book. We remember, too, a once strong desire to be an engineer, and instinctively our hands reach out for "The Wonder Book of Railways" (Stokes). Here again we find an English importation, with graphic pictures of the best-known trains running from London every day, and the system of safety protection in vogue. Here and there are interspersed some appropriate jingles and stories, but generally the text deals specifically with the technical side of the operation of railways.

From good picture books to good pictures is only a step, and at an early age children should be taken to the museums for stories concerning some of the best-known canvases. Mrs. Head's "How to Enjoy Pictures" (Stokes) will interest the older girl and boy who may desire to know something of the life and style of the world's greatest painters. Schools would find a book of this character well suited to advanced classes. Ellison Hawks's "The Boys' Book of Astronomy" (Stokes), historically and technically, appears to be a complete treatise for the young investigator. Each chapter is well illustrated. Another Stokes publication is Royal Dixon's "The Human Side of Plants," which is an investigation into the individual habits of the plant world. In a very readable fashion, the author tells of those plants that sleep, walk, swim, dance; that defend themselves by changing color or attacking. Many pictures adequately illustrate the text.

"Stories from Browning," by Verney Cameron Turnbull (Crowell), is intended "as a grounding for younger readers," who, the author hopes, "will go straight from these tales to the poems on which they are based." Whether they will always recognize the latter is doubtful, in view of the expansion of "Tray's" forty-five lines into ten pages. Mary C. Sturgeon's "Women of the Classics" (Crowell) merits attention for its full-page photogravures from originals by Lord Leighton (Helen, Andromache, Alcestis), Patten Wilson, Gertrude Demain Hammond, and others.

An original conception of the informative narrative is revealed in T. Brailsford Robertson's "The Universe and the Mayonnaise" (Lane). The author begins with the assertion that the universe is indeed like mayonnaise, illustrating in its action just what takes place when oil is dropped into the yolk of egg. Then he proceeds to discuss the world we live in, beginning each chapter in a way to catch the interest of his reader, before settling down to concrete instruction. One may prefer the fount of knowledge undefiled, but Mr. Robertson's treatment is decidedly ingenious. "How Man Conquered Nature," by Minnie J. Reynolds (Macmillan), describes the slow evolution of civilization through the mastering of those agents which nature offers.

Every year books are issued especially for busy little fingers, and such manuals do service most when the day is rainy and children are forced to remain in the house. The nursery shelf will be the richer for the suggestions contained in Patton Beard's "The Jolly Book of Boxcraft" (Stokes). Many will probably remember H. G. Wells's splendid game of War, which was described when there was peace abroad, and time for such sport. The present volume contains directions akin to Wells's, though Boxville is a peaceful village, given over to the arts and crafts of peace. All the fun may be obtained from common shoe-boxes; they may be so cut and so arranged as to furnish the whole space of floor-land with hotels, railway stations, and furniture. The only tool necessary for the enjoyment of Clifford Leon Sherman's "The Dot Book" (Houghton Mifflin) is a very soft pencil, and it does not matter whether you are an artist or not. If you know how to count up to a hundred, then you will find it easy to make straight lines between the various dots scattered through twenty-five pages of a quaint and clever book. Rose O'Neill's "The Kewpie Kutouts" (Stokes) will prove a welcome gift for young children. A sharp pair of scissors must be used to snip out the insert color pages, which contain, not only a complete set of Kewpie characters, fore and aft, but likewise their costumes, for ordinary, party, and garden wear.

A series of stories was begun last year which attempted, in fictional manner, to describe the characteristic customs and ideals of the children of other nations. The volumes added this year are four in number, published by Dutton. Our attention is first drawn to "A Boy in Eirinn," by Padraic Colum, the Irish playwright. There is so much reference to Irish history and folklore that it has been found necessary to place notes at the end of the book. Many legends are interspersed through the text, and there is an Irish play simply written, so that it can be presented by schoolboys. Laura Spencer Portor has written "Genevieve," a story of French school days. We have also Margarethe Müller's "Elsbeth," which portrays home life in Germany, with notes, and poems, and music towards the end, and a sufficient sprinkling of German phrases and verses to give atmosphere. These stories are all peaceful and gentle in spirit, and Florence Converse, the editor of the series, introduces each volume with a species of intimate letter, which gives the setting, and makes the reader appreciate what America may expect of the hopeful immigrant.

"When I Was a Boy in Palestine" (Lothrop) is by Mousa J. Kaleel, and is a first-hand narrative of life and customs in the East. It is one of a series of Children of Other Lands. With the idea that a girl and boy could do no better than spend a vacation in profitable travel, Margaret Williamson started last year taking her hero and heroine through England and Scotland on a personally conducted tour. This year she publishes the account of "John and Betty's Irish History Visit" (Lothrop), with numberless photographs reproduced. The style is of the conversational Baedeker kind, and there are encyclopædic stretches of information.

Next to travels in a strange land come the fairy tales of a strange people. "Forty-four Turkish Fairy Tales" (Crowell) have been set down by Dr. Ignacz Kanos, and well illustrated by Willy Pogány. The pictures are excellent, and the format of the book—except for a sharpness of typography—is attractive. We may also mention the charming Pogány Toy Books put forth by Henry Holt & Company at fifty cents. Robinson Crusoe, Red Riding Hood, Hiawatha, The Three Bears, and The Children at the Pole, unfold before the juvenile reader in accordion form with pictures by Willy Pogány on one side and text on the other.

Some very inexpensive and attractive importations bear the imprint of Frederick A. Stokes. They are to be commended, first of all, because of their artistic covers, and then because of their clear, large print. We like also the selections made for the entire set of books grouped under the general title "Stories We Love." What the editor thinks these stories are may be measured by the selections already made. Irving's "Rip Van Winkle" has never been better handled in pictures for young folk than by Charles Robinson, whose color work and line drawings are full of freedom and imagination. We also commend Grimm's "The Ogre with the Three Golden Hairs." In addition there are Mark Lemon's "The Enchanted Doll," Ouida's "Moufflou," which, though containing much of the tenderness of "A Dog of Flanders," does not compare with it in exceptional beauty of treatment, and "Sindbad the Sailor." Stokes also imports a series entitled "In Days of Old," which might appropriately carry the second part of the old song, "when knights were bold." Arthur O. Cooke's "Stories of Rome" should appeal to the boy even before he has begun to study Latin, and should whet his appetite for Roman history. Henry Gilbert, with the old ballads ringing in his ears, and fitly accompanied by the brilliantly colored brush of Walter Crane, has retold the story of "Robin Hood and His Merry Men." Dorothy King does good service for the "Stories of Scotland," and in similar graphic manner Mr. Cooke has fictionized significant stories in the history of France.

Two volumes representative of opposite types of nature-books are before us. The first is by C. H. Claudy, and is called "Tell-Me-Why Stories About Animals" (McBride).

Evidently the author of the "Tell-Me-Why" books agrees with the method, even though he has not the art displayed by Kipling in his "Just-So Stories." More nearly in accord with the legitimate style of nature-work is Jean M. Thompson's "Wild Kindred of Fur, Feather, and Fin" (Wilde), but there is a tendency on the part of the author to slip into the reminiscent style of Charles G. D. Roberts and W. J. Long. The chief complaint lodged against this style is that it is not strictly accurate. But we contend that for children such books instil a feeling for nature which is not to be found in the regulation natural history or botany. In her usual manner, Margaret W. Morley adds to her already goodly list of nature books "Will o' the Wasp" (McClurg), which, though it does not vie with Maeterlinck's "The Life of the Bee," will at least give the young reader some definite ideas regarding the habits and mining qualities of these strange little insects. The style is conversational, almost as tiresome to the grown-up reviewer as it must be to the child.

Two annuals are sent us for review. There is "Stokes's Wonder Book," with the usual medley of pictures, prose, and verse, and there is "Dutton's Holiday Annual," of the same pattern and nondescriptness. We have had better editions of "Old-Time Nursery Rhymes" (Dutton), and, though we recognize the excellent touch of Gordon Robinson in the line drawings, their daintiness has somehow been spoiled by the manner of their reproduction. We welcome a modern poet for children in the person of Abbie Farwell Browne. Her "Songs of Sixpence" (Houghton) is a charming volume, with many felicitous expressions of childhood.

Still for the younger children, one of the notable issues is "The Jessie Willcox Smith Mother Goose" (Dodd, Mead), boasting three hundred more rhymes than have ever been put into one of these collections before and illustrated with many pictures in color and still more in black and white. Older readers will be interested in the historical introduction and in the comparatively small section containing all the rhymes that appeared in the first known edition of "Mother Goose." Other rhyming books are "My 1, 2, 3 Book" (Dutton), which is intended to familiarize its little readers with some of the mysteries of numbers below 12; "The Which Book," by David Cory (Platt & Peck), designed to impress the advantages of cheerfulness; "Fairy Surprise Pictures" (Dutton), with verses by L. L. Weedon, and "Let's Go to the Zoo!" (Duffield), written and illustrated by Grace G. Drayton. In prose are David Cory's "Mother Nature's Cheerful Children" (Platt & Peck), in which plants and birds talk; Lady Moreton's adaptation from the Spanish of Padre Luis Coloma's "Perez, the Mouse" (John Lane; 35 cents), with noteworthy illustrations in color by George Howard Vyse, a dainty little volume; Martha Strong Turner's "Strange Playmates," with illustrations by Grace Quackenbush (Duffield), and Mary A. Hay's "The Peggy and Pussy Book," with amusing pictures (Duffield). Richard Waylett's verses in "A Box of Crackers," "Mixed Pickles," and "A Basket of Plums" (Dutton) are often intended for more highly sophisticated intelligences than those of children, but the latter will enjoy some of them and the pictures by Lawson Wood, John Hassall, and others. From the Page Company, of Boston, we have "The Island of Make-Believe," by Blanche Elizabeth Wade. The book is avowedly for little tots, as both the text and the illustrations, some of them in color, make sufficiently clear. But it is full of the "let's pretend" fancy which all children like to indulge.

There are one or two little books that tell pleasant Christmas tales, like "The Blossoming Rod," by Mary Stewart Cutting (Doubleday). The Revells have issued Winifred Arnold's "Little Merry Christmas," which narrates what a small heroine did to soften the heart of a regular hard, New England uncle, who was seemingly flint in make-up, and aloof from his neighbors. For almost-grown and for full-grown readers, some Yuletide pleasure may be obtained from two stories by Leona Dalrymple, entitled "Uncle Noah's Christmas Inspiration" and "Uncle Noah's Christmas Party." Both of them are issued by McBride.

But literally and literarily speaking, we fear that the old-fashioned Christmas has disappeared from juvenile literature. *St. Nicholas Magazine* generally has a special cover design for the holiday season, and there is snow upon it, and a few sleighs and sleigh-bells somewhere in the picture. But in most cases we get only a sprig of holly. Where are the song books that publishers used to bring out; the carols? This is the first year in a long while that we have failed to get Dickens's classic "Tiny Tim" in some form. A faint idea of what we should like to see is gleaned from a dramatization of Kate Douglas Wiggin's "The Birds' Christmas Carol" (Houghton), with stage directions for the amateur. The school looking for something to present at the Christmas celebration could do no better than examine this little play.

Science

The distinguished author of "Artificial Parthenogenesis and Fertilization" (University of Chicago Press; $2.50 net) has been an important figure among the group of men and women whose work has given to America a leading place in the field of experimental biology. Prof. Jacques Loeb is a prolific and original investigator, but probably his most striking contribution is the discovery of methods of producing artificial parthenogenesis, that is to say, of causing the eggs of certain animals to develop without fertilization by the sperm. In bisexual animals, the egg-cell of the female after maturation, leaving aside some special cases, is not capable of further development unless it unites with the sperm-cell of the male, a union that is designated as fertilization—in fact, as Loeb emphasizes in this book, the unfertilized ovum is destined to undergo a somewhat speedy natural death. On the contrary, if fertilization takes place, the egg begins to multiply by segmentation, and step by step, or, rather, cell by cell, to build up an animal organism similar to that of the parents. The act of fertilization induces a profound change in the processes within the egg, and it may be easily understood that since this fact was known biologists have regarded it as one of the fundamental phenomena which their science must hope to explain. What Loeb has accomplished is to prove that the egg-cell when treated by certain simple physico-chemical procedures, acts as though it had been fertilized. Instead of dying, it goes on developing along the path that is normal to it.

The most successful of Loeb's methods of artificial fertilization consists in treating the eggs, first, with a fatty acid (*e. g.*, butyric acid), and, subsequently, with a strong (hypertonic) salt solution. The first treatment leads to the formation of a fertilization membrane round the egg, and thereby starts its development, while the second treatment supplies a corrective factor that prevents the disintegration of the egg. Although the mode of action of these solutions remains a matter for speculation and experiment, the possibility of artificial fertilization is a matter of prime importance to the biologist, because it transfers the process from its former mysterious surroundings to the clearer and simpler condition of a physico-chemical reaction that may be studied and modified by precise experimental procedures. The book under review describes the steps and reasoning by which the author was led to this discovery. His account is not written for the general reader, but for his fellow-scientists, and even they may find it difficult at times to follow the thread of the story. This latter difficulty is perhaps due more to a defect in presentation than to any intrinsic complexity in the methods used, for it must be admitted that the author has not an especially attractive style. To the specialist this lack will be a matter of small importance, for the book contains the solid substance of many years' laborious and successful work.

In contrast to the attention given to martial instruction and discipline, little heed has been taken by military administration of the preservation, rather than the restoration, of the health of troops in garrison and in the field. Now, however, it is recognized that muskets are better than muster-rolls as a measure of force, and that the sick-list, the morbidity, of a command is an important limitation to the efficiency of an army; and the prevention of disease, the hygiene of war and that of peace as preliminary thereto, is formally taught with gradually increasing particularity and stress. Lieut.-Col. Frank R. Keefer, of the Medical Corps of the army, whose detail to the professorship of military hygiene at West Point has very recently expired under the regulation governing such assignments, has put forth an admirable presentation of the subject ("A Textbook of Military Hygiene and Sanitation." Philadelphia: W. B. Saunders Co.; $1.50 net). This is a common-sense and very practical explanation of what should and what should not be done by officers and men under them, in order to promote military efficiency. The whole text is good, very good, when its scope is borne in mind, the chapters on Disposal of Wastes, Tropical Service, and Alcohol and Other Narcotics in particular. The soldier, after all, is an able-bodied laborer marked out for a special service. The fundamental conditions that influence his health are identical with those that affect other communities of workers. Hence the necessity of teaching him physiological laws. Next to the cadets, for whom it has been prepared, this little book should be most valuable to the officers and non-commissioned officers of the National Guard, who may develop into volunteers. It is the latest, the most easily understood, and the most practical of treatises on the care of troops, the essence of military hygiene. Ignorance in officers and unconcern by men towards these inconspicuous essentials put

volunteers, equally brave, and frequently on a higher intellectual and social plane, in a different class from regulars. Drill is the beginning, not the end. The officer's watchful oversight should regulate the soldier's daily life, until he recognizes the dignity and value of intelligent self-control. The recruit, boasting that he enlisted to fight and recalcitrant towards any duty not with arms, is the unit of a mob, not of an army. The more that information like this is absorbed by the people, the sooner will the sciolistic pacifist understand that a man in uniform with a gun is not necessarily a soldier, capable to suppress disorder or repel attack.

Unquestionable as is the value of this work, it has superficial blemishes that might be eliminated. Thus, on pp. 74, 76, biological discoveries of great clinical value are truly attributed to a British and a French army medical officer. Why should not Ronald Ross and Alphonse Laveran be designated by name? On p. 68, Almroth Wright is not, as it seems he might be, noted as the pioneer in the study of the "antibodies," so important in the prevention of typhoid fever. Such names deserve to be drawn out of the ruck. In that connection, without being a purist, one still may take exception to "vaccinate" and "vaccination" as describing the means of prevention of other diseases than smallpox. It is true that abundant precedent may be found in the writings of "scientists" who have small regard for etymology; but the cow, a legitimate sponsor for true vaccination, should not be credited with the whole range of preventive inoculation. A proofreader's neglect makes "Wylie" (p. 261) do duty for Wiley, but the author himself seems to have overlooked the specific effect on the nervous system, above the overcharge of alcohol, in the malignant absinthe (p. 261). These and other minor matters, omissions as a rule, may well be forgiven as venial in this first edition.

"The Mason-Bees" (Dodd, Mead; $1.50 net), by J. Henri Fabre, is a selection of chapters from the "Souvenirs entomologiques," especially from the early part. Together with a projected volume on "The Bramble-Bees and Others," it will form an extended study of the wild bee. One of the most effective chapters is that entitled Reflections Upon Insect Psychology, in which Fabre arrives at the usual conservative conclusion in the reason-versus-instinct controversy. Much of the book deals with tirelessly pursued field experiments. If the reader does not follow the discussion carefully, he is soon hopelessly lost; if he does, he is indeed fascinated. M. Fabre's gracious, nimble style is precisely the medium demanded by the subject. Here is the mason-bee just returned home: "Over waving corn, over fields all pink with sainfoin, she has covered the two miles and a half and here she is, back at the nest, after foraging on the way, for the doughty creature arrives with her abdomen yellow with pollen." She discovers a strange bee in her nest: "What's this? I'll teach you!" A desperate chase ensues, and the interloper is finally vanquished. "Reversing the savage Prussian maxim, 'Might is right,' among the Mason-bees right is might, for there is no other explanation of the invariable retreat of the usurper, whose strength is not a whit inferior to that of the real owner." The translator, Alexander Teixeira de Mattos, has maintained the high standard set in the previous volumes. The proofreading, however, is defective.

Drama and Music

"AT THE BARN."

The second piece in Miss Marie Tempest's répertoire of plays, which was produced last week at the Comedy Theatre, is a pleasant and amusing little light comedy, admirably presented, but without any of the structural excellence which distinguished its predecessor, "Mary Goes First." The author, Anthony P. Wharton, somewhat disarms criticism on the ground of the absolute unreality of the initial idea of his play by describing it as "an idyll." Certainly the situation in "At the Barn" makes somewhat violent demands on credulity. Into the masculine peace of a country house, where three men are living a decorous bachelor existence, intrudes a feminine creature of infinite charm. A theatrical lady, she has been motoring with an angelic peer—angelic in the theatrical sense; the motor has broken down and the lady, being exceedingly tired of her lord's society, wanders away to "The Barn," and, liking her surroundings, decides to stay there. In the course of the play it develops that her connection with the peer is the result of a bargain struck some time ago; the peer, through his wealth and influence, was to give her the opportunity on the stage that her talents deserved, and she, after he had fulfilled his part of the compact, was to pay the price. When the play opens she has had her opportunity and made good use of it, but as the time for payment approaches she finds herself regretting the bargain. Accordingly, to think things over, she decides to stay for three weeks with the defenceless bachelors upon whom she has unceremoniously descended. The obvious solution is reached in an honorable attachment between herself and her host, the owner of "The Barn."

After starting with an utterly unreal situation, it must be said that the author has done his best to make it appear as little preposterous as possible. The situations are cleverly conceived and the dialogue is vivacious. As interpreted by Miss Marie Tempest and an exceedingly competent company, the piece is decidedly entertaining. The rôle of Molly Blair affords Miss Tempest the opportunity of displaying a greater variety of mood than did the Mary in "Mary Goes First." In particular, the part gives occasion for one really notable piece of acting. That is at the end of the first act, where Molly sits alone at a tea-table, the bachelors having refused tea and denied themselves her company. For fully two minutes of silence before the curtain goes down Miss Tempest is divided between the attractions of the cake she holds in her hand and the impulse to dissolve into tears. The latter finally wins, as the curtain descends, but in the meanwhile the audience has seen a pantomimic study which in its own way is unsurpassed.

The general performance was smoother than in "Mary Goes First," possibly because the type of comedy required a less subtle understanding. Excellent impersonations were given by Franklin Dyall and Guy Newall as James B. Crane and William Lewis, two of the bachelors, the performance of the former in particular standing out as a sympathetic and well-studied characterization. The Kenneth Maxwell of A. E. Anson was an interesting but somewhat elusive performance. Intellectually, it appeared irreproachable, and Mr. Anson's finished technique is as rare in these days as it is delightful; but the performance lacked warmth, and failed to convey to the audience the conviction, which was essential, that Maxwell throughout was unwillingly falling in love with the pert intruder on his peace. W. Graham Browne brought out nicely the conflicting elements in the character of Lord Clonbarry, and Herbert Ross's Knowles was a good study of the butler in the bachelor ménage. The play is well produced, but the sets, particularly in the garden scene, are somewhat too large for the small stage of the theatre, and the effect is crowded.

S. W.

"SO MUCH FOR SO MUCH."

Willard Mack, in this play, which was produced at H. H. Frazee's Longacre Theatre on Friday of last week, has written an unpretentious little study of life which, judging from the reception accorded to it, should meet with no little success. It is essentially an actor's play—one might fairly call it, in no derogatory sense, theatrical—dependent upon situation rather than upon either dialogue or character. Whatever success it may enjoy will be attributable, first, to the sincerity with which the author has attempted to present on the stage, as it were, a corner of life, and, secondly, to the excellence of the cast which presents it, and particularly to the easy, unexaggerated, and absolutely faithful impersonation of a stenographer given by Miss Marjorie Rambeau.

The plot concerns the temptations which we all know are offered to girls earning their own living by a certain class of employer. That is a commonplace theme and one that has been used much too frequently. As developed by Mr. Mack, however, it is lifted out of the commonplace by the introduction of another idea of more universal implication. This, too, is an old friend, but not a commonplace one, for it is nothing less than the Greek ὕβρις and its attendant nemesis. The real point of the play is not that a working girl is subjected to temptations, but that a girl is in most danger of being overborne by them when she thinks that experience has taught her how to cope with them and that she is the equal of any situation. This idea is developed by the author, without great subtlety, but with considerable theatrical ingenuity, in tracing the relations between Mary Brennan, the hubristic young stenographer, and her employer, William Steadman. The latter is sufficiently acute to win the confidence of his worldly wise stenographer by a succession of apparently platonic courtesies and attentions, for which no return is asked. Of course, in the end, it turns out that he is like all the rest, but more patient and more subtle. The dénouement is revealed in the apartment of this subtle rogue, whither he has inveigled the girl into coming, under pretext of an attack of rheumatism and pressing business. The introduction of the girl's discarded fiancé (excellently played by Mr. Mack himself) at the opportune moment, and the complete unmasking of the rascal Steadman, is patent theatrical trickery, but it cannot be called illegitimate. A defect of the play is the abnormally lengthy exposition of the situation, which occupies a good part of the first act, and which might with advantage be cut in half. Interest begins at the moment of Miss Rambeau's entry and is sustained whenever she is on the stage.

S. W.

"POLYGAMY."

It would be hard for one not a direct observer of the life to say how accurately Mormon conditions are set forth in "Polygamy," now running at The Playhouse. For the mere critic the action and characters of the drama are manipulated plausibly enough. The authors, Harvey O'Higgins and Harriet Ford, who achieved some success last season with "The Dummy," have selected a bit of American life which not only is picturesque, but has tragic significance. This of itself would speak well for the choice of material. But in making the play revolve around the suffering of a young devoted wife and mother, whose husband has been commanded by the Prophet to take unto himself another woman, the authors have penetrated to the centre of the emotional situation. That the husband, who shares her aversion to polygamy, contrives to escape from the consummation of the second union saves the play from actual tragedy; but tragic, too tragic in potentialities, it is from beginning to end. And therein, to our mind, lies its defect. If the "big scene," in which the first wife swoons at the bedroom door of wife the second, had been relieved by scenes of much lighter content, it might have affected the audience powerfully. But, owing to the activities of an apostate brother, who refuses to be a hypocrite, the steam-roller of Mormonism is early set to work, with the result that each act is filled with sobbing, and that the sensibility of the audience has at the end become sated.

The construction of the play, except in the sense that the "big scene" is clearly led up to, is thus not at all skilful. Part of this deficiency would be concealed, however, if there were any characters that stood out as individuals. But personal touches appear to be beyond the authors' power. The character-drawing, though not inconsistent with the framework of the theme, lacks all distinction; and it is clear that the considerable interest which the play aroused in the audience came chiefly from the sheer visualization of significant conditions, shrewdly selected.

Miss Chrystal Herne gave a satisfactory performance of the first wife, and she was well supported by William B. Mack as the brother, Ramsey Wallace as the husband, and Howard Kyle as the Prophet, who to the layman certainly looked the part.

F.

"SIGNOR PERUGINI."

The death of John Chatterton, better known by his professional name, Signor Perugini, will recall to the elder generation of playgoers a performer with as strange, eventful a history as that told in the Forest of Arden. His first public appearance was as the prize-winner in Barnum's original baby-show. That success seemed to mark him for the stage, and, having a remarkably slender frame and a gift for dancing, he donned, as a young man, the short, spangled skirts of the ballet of that period, and capered and pirouetted as a première for the delectation of the gilded youth of New York for a whole season. They showered him with flowers and jewels and love letters till his friends feared his arrest for fraud, and persuaded him to send a note to one of his most intense adorers, conveying by indirection a hint of the truth. It was this adventure which, told at a New York dinner-table one evening in the seventies, so delighted John Hay and Thomas Bailey Aldrich that each undertook to write a short story with that as a theme. The two authors had a friendly race to see who could reach the public first with his version, and both stories appeared simultaneously, one in the *Atlantic Monthly* and the other in the *Galaxy*. The hero's identity was, of course, carefully disguised, and only a small circle of readers suspected it.

Some kind patron, having discovered that Perugini had in him the making of a singer, sent him abroad for a musical education, and he appeared as a tenor in several operas without much success, but, chancing to join one minor troupe in which the prima donna was suffering from a throat trouble which sometimes attacked her in the midst of a performance, he became her understudy, and repeatedly deceived her not over-critical audiences into believing that they were listening to her, when she was merely going through the business of her part and he was supplying her missing voice from the wings. His last noteworthy effort as an actor was made as Chorus in the ingenious Chinese play, "The Yellow Jacket."

VICTOR HERBERT'S "THE DEBUTANTE."

It would be interesting to know how many —or how few—operettas, or musical comedies, have been produced in this country without the aid of Harry B. Smith as the librettist, or one of the librettists. His name, together with that of Robert B. Smith, appeared, as a matter of course, on the playbill at the Knickerbocker Theatre on Monday night, when Victor Herbert's "The Débutante" had its first metropolitan hearing. It cannot be said that they produced a masterwork, either in the matter of plot or of dialogue.

No one but Victor Herbert could have built a successful operetta on so slender a basis, but he has done it. "The Débutante" has been on a prosperous tour for several months, and has been so thoroughly rehearsed in consequence that it went, at the Knickerbocker, with a swing that resulted in a great deal of applause—too much, in fact, for nearly every one of the twenty numbers was redemanded from three to five times. Not a few of these numbers are not of the best Mr. Herbert has composed, but there are several gems, conspicuous among which are a deliciously Irish song entitled "Peggy's a Creature of Moods," and a pretty waltz, "The Love of the Lorelei," both of which are sure to become drawing-room favorites. There is another song, "The Golden Age," which has one of those ravishing orchestral accompaniments for which Victor Herbert is famous. Indeed, throughout the score one feels the genius of the composer of "Natoma," who has to restrain himself not to write above the heads of operetta audiences. At the end, the composer has some fun at the expense of the Futurist or Cubist composers, by letting the orchestra indulge in pranks. There is also an effective violoncello solo played by one of the characters on the stage —a solo which recalls the fact that for some years Mr. Herbert was leading violoncellist of the Theodore Thomas Orchestra in New York. The new operetta gave Hazel Dawn an opportunity of making a successful début as a star.

Finance

RE-ESTABLISHING INVESTMENT MARKETS.

After eight days of open trading in bonds on the Stock Exchange, subject only to the provision that sales should not be made below a stipulated minimum price, the Exchange announced last Monday that, at the end of the present week, trading in stocks would also be resumed. This is a much more decided forward step. The committee of the Stock Exchange had hesitated to try the experiment with shares, even while reopening the bond market; their reasons being, first, that the price of bonds, with their yield to the investor fixed, could be determined by permanent intrinsic value, as the price of stocks could not, and, next, that foreign holdings of our stocks are usually quicker to be sold in a liquidating movement than are the holdings of our bonds.

The main ground for the decision to resume open trading in stocks was the visible result of the experiment with bonds. When the bond market reopened, on November 28, three possibilities existed. There might have been no purchases, which would have proved that investors were not willing to buy except at prices below the arbitrary minimum. Or prices might have advanced above that minimum and then have been beaten down to it again—showing that heavy liquidating orders overhung the market. Or prices, having opened at or above the stipulated minimum level, might have advanced continuously and maintained their gains.

This third possibility was what came to pass in the week of open trading. Practically all bonds opened above the official minimum price; most of them gradually moved up to a level a point or more above their opening figures; some of them rose four or five per cent. All this occurred on undoubted investment buying, and with transactions ranging from $1,000,000 to $1,500,000 daily. In the meantime, a very restricted market for stocks, not conducted openly on the floor of the Exchange, but privately, under the direct control of the committee, had presented the rather surprising picture of a very large proportion of the active shares selling at higher prices than they brought on July 30, just before the Stock Exchange closed its doors.

Under such circumstances, it was clearly time to extend the facilities for open trading in all classes of investment issues. It was recognized by observant financiers to be from every point of view desirable that the Stock Exchange should extend its present tentative arrangements, as soon as was reasonably warranted, to the status of a free and open market. Naturally, this does not mean that unrestricted trading ought immediately to be adopted, and "minimum prices" abandoned. The Stock Exchange authorities and the financial community are still testing the actual character of a com-

plicated financial situation, whose outcome in relation to the markets, whether immediate or ultimate, is marked out by no clear precedent in financial history.

That test has not yet been long enough pursued to establish positive conclusions. But the very purpose which inspires it infers that the testing process must be progressive, and must move forward step by step in the direction of normal conditions of investment trading. The one unquestionable fact is that, sooner or later, an unrestricted open market must be restored. If extensive European liquidation of American securities is inevitable, we shall sooner or later have to meet it. Indeed, there is some force in the argument that, in so far as absorption of foreign capital in the war loans is bound to be an influence on such realizing sales, it may be better to accept the situation in the earlier rather than the later stages of the long-term borrowing by the European Powers.

All this the Stock Exchange authorities unquestionably recognize, and it is now apparent that they are taking successive forward steps with such general facts in view. The time and manner in which each successive action in this direction will be taken must in the nature of things depend on the result of the preceding extension of facilities. Thus far, it is agreed on all hands that the preliminary test which began on November 28 has thrown most encouraging light on the general position of affairs. Whatever reservation of judgment may be made, in view of the restrictions on permitted prices, the salient fact remains that the bond market has been unquestionably strong, that a very respectable volume of genuine investment buying has been witnessed daily, and that neither in bonds nor stocks has there been any evidence of a tendency to press on the minimum price level.

These reassuring facts are naturally ascribed in Wall Street to such other visible evidence of return to normal as the extinction of the loan certificates and the rapid retirement of emergency banknote issues. Yet such unofficial trading as has occurred, even at London, has lately presented similar signs of cheerfulness, and it is not unreasonable to ask whether the week's security markets have not also been reflecting a more favorable view of the situation in the war itself.

It will not have been forgotten how in August, even with the Stock Exchange shut down completely, all other markets whose action could reflect the inferences from the course of the campaign moved adversely during the German advance on Paris. The adverse movement at that time of foreign exchange, for instance, was admitted by every one to mean that the German advance foreshadowed very prolonged and stubborn war. The retreat of the German armies from the Marne was similarly accompanied by an immediate turn in foreign exchange rate in the direction of a normal basis, as well as by a fall in wheat. It is not by any means impossible that the developments on the recent market for securities may have reflected inferences, from the recent military news, that events such as would promise shortening of the war are now in progress.

A rather prevalent Wall Street theory, that the fortunes of the investment market will depend on the nature of the Interstate Commerce Commission's forthcoming rate decision, must be judged in the light of these other facts. The feeling as to that decision is entirely natural. There are certainly, in the existing situation, very strong reasons for the granting of higher rates, both to offset the difficulties of the market for new securities, and to avert, so far as possible, such unfavorable judgment of our railways' earning power as might tend, at this critical juncture, to stimulate foreign realizing or discourage fresh home investment. Reasonable concessions would do much to emphasize the present drift towards real financial hopefulness. But the larger influences, unfolding on the Continent of Europe, will remain.

Fear and Conventionality

By Elsie Clews Parsons

Author of "The Family," "The Old Fashioned Woman," etc.

12mo. $1.50.

Fear of change is a part of the state of fear in which Man has lived, but out of which he has for a considerable time been escaping. What Man now calls conventionality is that part of his system of protection against change which, with the lessening of his fear of change, he has begun to examine and even to forego.—*From the Preface.*

THE SURVEY

NATIONAL JOURNAL OF SOCIAL SERVICE

Industrial Conditions — Civic Progress — Municipal Problems

THE SURVEY is a weekly magazine for all those who believe that legislation, city government, the care of the unfortunate, the education of children, the work of men and the homes of women must pass muster in their relation to the common welfare.

In the Industrial Department the work of the Federal Industrial Relation Commission is fully covered. Notable developments in the adjustment of relations between employer and employee, to secure for the workers safety, health, and good wages, are reported.

The Department of Common Welfare is a weekly review of the latest achievements in the fields of civics, education, sanitation, housing, health, child labor, probation and other court work, and all movements of social progress.

THE SURVEY is first and always an open forum for free discussion. In its pages, particularly in the Communication Department, radical and conservative, idealist and cynic, meet on an equal footing and thrash out their differences.

The price of THE SURVEY is $3.00 a year, or we will send to any reader of THE NATION a six months' trial subscription for $1.00.

A NEW LOGIC

By Dr. CHARLES MERCIER, physician for mental diseases at Charing Cross Hospital, London. Pp. 422. Price, $3.00.

Modern philosophy, from Descartes onwards, though not bound by authority like that of the Middle Ages, still accepts more or less uncritically the Aristotelian logic. Its advocates are in the main those whose extra philosophical knowledge is literary rather than those who have felt the inspiration of science. It is still believed that *a priori* reasoning can reveal otherwise undiscoverable secrets of the universe, and can prove reality to be quite different from what to direct observation it appears to be. It is this belief, rather than any particular tenets resulting from it, that this author regards as the main obstacle to a scientific attitude in logic.

MY UNKNOWN CHUM

("AGUECHEEK")

Foreword by HENRY GARRITY

The War of Nations adds greatly to the charm of this remarkable book. Whether you have ever been abroad or not, My Unknown Chum once read will be your Chum, as it is now the Chum of thousands.

It fulfils to the letter Lord Roscbery's definition of the three-fold function of a book—"TO FURNISH INFORMATION, LITERATURE, RECREATION."

What Critical Book-Lovers Say:

GOVERNOR DAVID I. WALSH of Massachusetts: "'My Unknown Chum'—I cannot too strongly express the pleasure and companionship I found in this excellent book. It is all that is claimed for it—even more. It is not only a companion, but a friend."

ALICE M. BRADLEY, author of the Belasco production—"The Governor's Lady": "The title, 'My Unknown Chum,' most aptly describes the book. It is a chum, a confidant, with old-time manners and all-time observation and philosophy. He takes you with him and delights you. What delicious humor!"

PHILIP GIBBS, the most brilliant of the English war correspondents: "'My Unknown Chum' is delightful."

COL. F. A. HEYGATE LAMBERT, Cavalry Club, London: "'My Unknown Chum' delighted me."

THE BOSTON GLOBE—"There is no denying the charm of 'My Unknown Chum.' Its English is a rest and a delight after the mess of undignified colloquialisms which lie between most covers nowadays."

THE N. Y. SUN—"The book is charming."

TWENTY-FIVE YEARS REMINISCENCES

By KATHARINE TYNAN

This "Notable Book" is Strikingly Opportune Because of Home Rule Success

(No book of recent years given so much space and praise by the leading literary papers of the world. Times, one page; Sun, five columns; Philadelphia Ledger, one page; Boston Transcript, two columns; Evening Post, editorial page; Nation, two columns.)

Turn up your Nation files of March 26, 1914, and read a severe critic's opinion of this extraordinary book.

History, Autobiography, Anecdote and delightful tales of celebrities by the master poet-novelist who knew intimately most of the prominent men and women of an interesting and eventful period—Redmond, Lord Russell, Parnell, Gladstone, Father Russell, Lady Wilde, Oscar Wilde, T. D. Sullivan, Louise Imogen Guiney, John Boyle O'Reilly, The Rossettis, The Meynells and many others. *Fifty pictures of World Notables. Photogravure frontispiece from the painting by J. B. Yeats, R.H.A., in the Dublin Art Gallery.*

This book more than any ever published will inspire women to respect men—single or married. It will urge wives and daughters to give Father (in many homes a mere money-getter for the family) the place he merits on the domestic pedestal.

Price $3.50. Pastpaid $3.65.

"The most difficult of all tasks is to think."—Emerson.

Do you teach or preach—or lecture? Do you write or dictate?

Do you, as hostess, want a spur to cleverness of thought, of wit and repartee?

YOURSELF AND THE NEIGHBOURS

By SEUMAS MacMANUS

Author of "In Chimney Corners," "Donegal Fairy Stories," "The Red Poacher," etc. Illustrated by Thomas Fogarty

This new book, MacManus's best by far, is redolent of Ireland, its love and laughter, its poetry, pathos and romance. Himself saturated with Irish life and Irish lore, the author has put into these pages the priest and the schoolmaster, the tinker and the tailor, the lovable, the quaint and the humorous Neighbours—all limned with the pen of love. We here witness the courting and the match-making, the wedding and the wake—we share the happiness of the fireside, the fun of the dance, and the frolic of the fair. It is a book whose freshness and joyfulness may lighten many a heavy heart.

GEORGE W. CABLE says of this book: "I may have read as good English—not often, however. But oh, when did any one ever read such darling Irish! MacManus's is a master pen, and a joy."

JAMES WHITCOMB RILEY: "I read it with avidity, as I read every line of MacManus."

HUDSON MAXIM: "MacManus is a genius. He makes Irish lore and memory live again. I like this book immensely."

GOVERNOR TENER (Pennsylvania): "When I got into the swing of it I sang rather than read the pages. It is a delightful—yes, delicious—book."

DAVID BELASCO: "It's delightful. It gave me a picture of Ireland and Irish character, so charming, fresh and quaintly humorous, and at the same time so pathetically tender, that I smiled and laughed and gulped, 'all in one breath.'"

ARCHBISHOP IRELAND: "It is wonderfully beautiful, both in sentiment and in diction."

MARY ROBERTS RINEHART: "With interest and joy I read it."

ELLA WHEELER WILCOX: "It is delightful—full of the best MacManus charm."

JUDGE BEN LINDSEY: "It is a great story by one of the greatest story-tellers in the world."

The New Poetry

SWORD BLADES *and* POPPY SEED

By AMY LOWELL

Author of "A DOME OF MANY-COLOURED GLASS," Etc.

In "The Boston Herald" Josephine Preston Peabody writes of this unusual book:

"First, last and all inclusive in Miss Amy Lowell's poetic equipment is vitality enough to float the work of half a sc re of minor poets. . . . Against the multitudinous array of daily verse our times produce . . . this volume utters itself with a range and brilliancy wholly remarkable. . . . I cannot see that Miss Lowell's use of unrhymed vers libre has been surpassed in English. Read 'The Captured Goddess,' 'Music' and 'The Precinct Rochester,' a piece of mastercraft in this kind. Here is the Dionysian revelry of a tireless workman. With an honesty as whole as anything in literature, she hails any and all experience as stuff for poetry. A wealth of subtleties and sympathies, gorgeously wrought full of master effects (as many of the poems are) and brilliantly worked out. The things of splendor she has made she will hardly outdo in their kind."

DODD, MEAD & COMPANY
NEW YORK

A NEW LOGIC

By Dr. CHARLES MERCIER, physician for mental diseases at Charing Cross Hospital, London. Pp. 422. Price, $3.00.

Modern philosophy, from Descartes onwards, though not bound by authority like that of the Middle Ages, still accepts more or less uncritically the Aristotelian logic. Its advocates are in the main those whose extra philosophical knowledge is literary rather than those who have felt the inspiration of science. It is still believed that *a priori* reasoning can reveal otherwise undiscoverable secrets of the universe, and can prove reality to be quite different from what to direct observation it appears to be. It is this belief, rather than any particular tenets resulting from it, that this author regards as the main obstacle to a scientific attitude in logic.

The Novels of Mrs. Mary S. Watts

"When Mrs. Watts's fullness of style, her charmingly intimate regard for detail and her wonderful ability for character portrayal are considered . . . comparison with Thackeray and the Thackerayan quality of the great age of English fiction, is striking and inevitable. . . . The scorn of meanness, the toleration of weakness, the pity for error, the detection of motive, the half-veiled satire, the reticence of feeling which suggests rather than displays emotion, result in passages of pathos or humor which might have come from the master's own pen."—San Francisco Chronicle.

NATHAN BURKE *$1.50*

"There is a slowly inereasing group of novels which seem likely to last much longer than the great mass of fiction which is talked about for a few months and then totally forgotten. This group is not large. Once in a decade an addition is made to the group. . . . 'Nathan Burke' is a novel so sound, so filled with much that has inspired the great novels, that it is hard to maintain moderate standards of comparison."—*Boston Transcript.*

THE LEGACY *$1.50*

"In 'Nathan Burke' and in 'The Legaey,' Mrs. Watts has reached a high-water mark in Amerieanism. Every page shows her truly remarkable gift of observation—observation shrewd but not unkind—and her power to probe the hearts of weak and erring mortals. Those who would keep in touch with the best product of story telling in America must not miss 'The Legaey'."—*New York Globe.*

VAN CLEVE *$1.35*

"Van Cleve's picture deserves to hang on the wall with the very best that Amerieanliterature has painted of the American man. . . . Mrs. Watts brings back the Spanish War in a style Tolstoi himself could not have bettered."—*The Bellman.*

"Altogether the book is in ripeness and mellowness the best of the three excellent novels whieh Mrs. Watts has to her credit, and it may be added that all three are entitled to a plaee of honor in American pictures of this country."—*The Outlook.*

Mrs. Watts's New Novel

Just Published

THE RISE OF JENNIE CUSHING *$1.35*

"Mrs. Mary S. Watts's latest story . . . is as indubitably a masterpieee of characterization as were her 'Nathan Burke' and 'The Legacy.' It has, too, much of the warm humor of 'Van Cleve.' . . . Jennie Cushing arouses your admiration, not merely for the self-control, balance and judgment of the woman, but for her unselfishness and her almost glorious freedom from petty meanness and misjudgments, and the utter absence of self pity from her makeup. Indeed, it is a masterpiece of charaeter drawing that, having all these fine qualities, Jennie never for an instant impresses you as a madeup character, created to work out a theory or to draw your sympathy."—*Brooklyn Daily Eagle.*

"Mrs. Watts has rapidly arisen to a place of honor in the small group of our eontemporary novelists who are seriously worth our while. Her books are native American to the core. This truly remarkable character study is remarkable in its unforced, altogether natural consistency and development. Loving service, the impulse to aid and comfort others, is the dominating trait of Jennie's eharacter."—*New York Tribune.*

"Oeeasionally a book appears that is so human, so vital, that one rejoices and suffers with the people that inhabit it. This is such a book, and the growth and development of Jennie herself is the best work that Mrs. Watts has done. . . . A character of the most profound and the most moving sweetness and wisdom, Jennie accepts the ugly facts and commonplaces of existence with serenity, but turns instinctively to beauty in whatever form it comes. . . . It is a good sign when such books are written in America."—*Philadelphia Public Ledger.*

The Nation

NEW YORK, THURSDAY, DECEMBER 17, 1914.

Summary of the News

There occurred last week one of those "unforeseen incidents" which, it has been suggested, might arise to force Italy to abandon her attitude of neutrality. The incident, in point of fact, occurred on November 11, but the details were only fully known to the Italian Foreign Office on December 3, and were not made public until Friday of last week. It appears that on the first-named date an effort was made by the Turkish authorities at Hodeida, a seaport of Arabia on the Red Sea, to arrest the British Consul-General, G. A. Richardson, at his house. Mr. Richardson, however, escaped to the Italian Consulate, which was thereupon invaded by the Turks. The British Consul was arrested and spirited away to an unknown destination, and the Italian Consulate was surrounded by an armed guard, the Consul being kept virtually a prisoner until the arrival of an Italian coast-guard vessel on December 3. Baron Sonnino, Italian Minister of Foreign Affairs, announced in the Chamber on Friday that Italy had demanded of Turkey the immediate release of the British Consul and his conveyance unharmed to the Italian Consulate at Hodeida; a formal apology for the violation of the Consulate, and indemnity for the wounding of an Italian subject in the course of the affair. In default of receiving satisfaction on these points, Italy will consider that the Turkish Government approves of the violence committed by the authorities at Hodeida. To give weight to the demand, the Italian armored cruiser Marco Polo has been dispatched to Hodeida. On account of the interruption of communications, it is believed that nothing is known of the affair at Constantinople, and it is thought probable that Turkey will yield to the Italian demands.

There have been no further developments in the situation in the Balkans. Reports of a rapprochement between Servia and Bulgaria, under the auspices of Rumania, have been renewed but not confirmed. A remarkably succinct analysis of the situation as it affects Bulgaria was given by M. Panaretoff, first Bulgarian Minister to the United States, in an interview published in the New York *Evening Post* on December 11. There is naturally a strong anti-Servian feeling in Bulgaria, but even so, according to M. Panaretoff, a rapprochement with Servia might be welcomed, even to the extent of armed co-operation against Austria, if it carried with it the cession of certain territory taken from Bulgaria after the last war. In Rumania public sentiment appears to be growing in favor of intervention on the side of the Allies. To the voice of M. Jonesco, Minister of the Interior, who has steadily urged participation in the war, has been added that of M. Filipesco, leader of the Conservative party, who, according to a dispatch from Bucharest to the Paris *Temps*, declared in an interview recently that Rumania would "soon abandon neutrality for more active sympathy with the Allies." Rumania, he added, was waiting upon Bulgarian intentions; "directly we are assured on this point—which I predict will be soon—Rumania will begin participation unreservedly."

The Legislative, Executive, and Judicial Appropriations bill was reported to the House on Monday. The bill provides for an appropriation of $38,744,753. From the estimates submitted by the various departments the Appropriations Committee cut off nearly $2,000,000.

Action taken by the Democratic caucus of the Senate on December 12 virtually insures a vote at this session on the Immigration bill. The Philippines bill and the Ship Purchase bill will also be considered.

The House Committee on Rules on December 12 reported a resolution to bring the national prohibition amendment and the woman suffrage amendment to a vote within two weeks. The proposed prohibition amendment is to be taken up on December 22, and the suffrage amendment will be considered after the settlement of the issue on prohibition.

Secretary of the Treasury McAdoo, in his annual report to Congress on December 9, outlined the steps taken by the Treasury Department to restore confidence and support American business in the crisis occasioned by the war. Comment on the report will be found in our editorial columns.

The annual report to Congress of Postmaster-General Burleson was published on December 13. The feature of the report that arouses most comment and criticism is the recommendation that the Government should take over both the telegraph and the telephone companies.

Col. Goethals last week made a request that two torpedo-boat destroyers be sent to the waters of the Canal Zone to prevent violations of neutrality by the misuse of the wireless and the taking on of supplies by belligerent vessels. Owing to the confidential nature of Col. Goethals's dispatch, the contents of it have not been made public. The matter, as we write, is under the consideration of the various departments in Washington involved.

The reopening of the Stock Exchange for trading in stocks on Saturday of last week was unattended by any sign of collapse of the market as a result of liquidation of foreign securities. On the contrary, most stocks showed an advance over the prices of July 30, when the Exchange was closed. At the reopening on Saturday fixed minimum prices were set, and trading was limited to certain issues. On Tuesday, however, in view of the success of the reopening, trading was resumed in all listed stocks.

Headed by Senator Hitchcock, a movement that has assumed some proportions has been started in Congress for the introduction of legislation to prohibit the shipment of munitions of war to any of the belligerent countries. Senator Hitchcock has also introduced a bill making it a violation of neutrality for any firm or corporation to lend money directly or indirectly to any of the belligerents. This movement, if it is allowed to proceed, appears calculated to cause some embarrassment to the Administration. For the President to exercise his personal influence on individuals to prevent the shipment of munitions of war to belligerents is one thing; to pass legislation when a state of war already exists that would totally change the internationally accepted understanding of the rights and prerogatives of neutral nations, would be another and a very different matter. It has even been suggested that such legislation, as tending to annul the advantage legitimately gained in the process of warfare by one belligerent over another, would involve in itself an actual breach of neutrality.

A meeting of the French Cabinet was held at the Elysée on December 11, for the first time since the Government withdrew to Bordeaux on September 3.

To succeed the Ministry of Senhor Machado, which, as we recorded last week, resigned on December 5, a Democratic Cabinet has been formed in Portugal by Senhor Azevedo Coutinho.

An official statement was given out by Gen. Louis Botha on December 10 to the effect that the rebellion in South Africa was virtually at an end, only one rebel leader of any consequence, Col. Maritz, who has escaped to German Southwest Africa, remaining uncaptured. Gen. Botha added that the next duty of the South African people and Government was to "make it impossible for German Southwest Africa again to be used as a base from which to threaten the peace and liberties of the Union."

Many speculations have been heard as to the possibility of the existence in Germany, unheard through the muzzle of the censorship, of a peace party. Some confirmation, which, however, should not be unduly emphasized, appears to have been lent to such a suggestion by the refusal of Dr. Liebknecht to vote in favor of the war budget and by the terms of the motion which he handed to the President of the Reichstag on that occasion and which the President refused to put to a vote. The motion denounced the war and the breach of the neutrality of Belgium and Luxemburg, and demanded the conclusion of a speedy peace without conquest. Dispatches from Copenhagen also state that a carefully conducted anti-war agitation is going on among a certain section of the Socialists, and that some members of the party, like Dr. Liebknecht and Frau Rosa Luxemburg, have been remarkably outspoken in their condemnation. The fact that these leaders have not been arrested, it is suggested, indicates that the movement is so formidable that the Government shrinks from the consequences of punishing them.

The deaths of the week include: William Woodville Rockhill, December 8; Congressman Sereno E. Payne, Joseph Smith, December 10; Rear-Admiral Eugene W. Watson, December 11; Major-Gen. Sir Edward G. Brabant, December 12; Dr. Charles Périer, December 13; Giovanni Sgambati, Katherine M. Cohen, December 14.

The Week

The call for an organization actively to combat the present craze for armaments, and to work along the lines of the President's message to preserve the moral prestige of the United States that it may lead the world in the direction of peace and disarmament, is headed by such New Yorkers as Bishop Greer, Nicholas Murray Butler, George Foster Peabody, Adolph Lewisohn, and Clarence H. Kelsey. The time has plainly come for those who are opposed to slavish American imitation of European armies—the tools, as Dr. Liebknecht, the German Social-Democratic leader, has just pointed out, of "war parties in the obscurity of absolutism and secret diplomacy"—to speak out. Women, too, are represented on the committee, which will, we trust, soon find an opportunity to protest to Congress against further militaristic expenditures. A great difficulty has been that the armor-makers, or their representatives, and the generals and admirals have been the ones to appear before the committees of Congress, and not those who believed in our peaceful mission and ideals. Hence it has come about that of every dollar appropriated by Congress, 70 cents have gone to wars, past or future, and only 30 cents to the cost of running the country and to every constructive enterprise such as irrigation—a state of affairs that future generations will regard as complete proof of our lack of intelligence and enlightenment. But the new organization would be fully justified if it existed only to combat the pernicious activities of the Navy League and those new societies which appear to be so deeply interested in obtaining facts already known to everybody.

Rumors are renewed that Prince Bülow, the new German Ambassador to Italy, will make glittering offers to the Italian Government in order to keep it friendly to Germany. What is really meant, of course, is that a great exertion will be made to prevent Italy from joining the Allies. To attain this it is plain that Germany would be prepared to go a long way. But to suppose that she would coolly propose, as the dispatches intimate she will, to give Italy the Trentino, as the price of friendship, is to stretch credulity. Such a step might placate Italy, but it would surely infuriate Austria. If any land-bribe at all is laid before Italy it will much more probably relate to French possessions in North Africa. But every suggestion of the kind is pretty certain to be frigidly received in Italy just now. As one Italian newspaper has remarked, the "nephews of Machiavelli" are not to be easily taken in by blandishments of which the occasion and the motive are so obvious. It is very likely, too, that the Italians will remind Prince Bülow of the rather depreciatory things which he wrote only last year about Italy's part in the Triple Alliance. He then frankly expected little of it, quoting a remark of Bismarck's to himself that it would be enough, in case of war, if Italy sent one corporal and one drummer to the French frontier. But even such a perfunctory adherence to the Triple Alliance has failed Germany this year. It is but one of the many broken diplomatic reeds on which she thought she could safely lean.

A German war correspondent, writing from Insterburg, Prussia, on the 17th of November, reported another great exodus from the region near the Russian boundary, more than 40,000 German refugees having passed through that town in the week previous to the date on which he wrote. He draws a terrible picture of the suffering and woe of the fugitives, of whom 25,000 were placed on trains and sent further into Prussia. Thousands upon thousands of them had abandoned everything except the clothes on their backs, and were seeking refuge elsewhere for the second time. Those that had horses saw them taken from them by the military authorities, and their abandoned wagons were left standing by the roadside. Small cities like Stallupönen, Goldap, and Gumbinnen have been emptied of their inhabitants, not five hundred remaining in the last-named, formerly a large and prosperous town. Having had one experience, they say, of the Russian invaders and their methods, the inhabitants of Gumbinnen preferred to abandon their all rather than risk another occupation. Should the Russians get further into Prussia or into Silesia, the problem of handling these refugees will be a very serious one for the Government, which already has to feed and care for fully three hundred thousand Russian prisoners. East Prussia, at least, is a marked exception to the German contention that so far the war has been carried on elsewhere than on German soil. In that province, there ought to be genuine sympathy with the Belgians.

The action of the Governing Board of the Pan-American Union, in forming a special commission to consider the new problems of international law thrust forward by the great war, has a twofold interest. As a serious and united endeavor, on the part of the nations of the Western Hemisphere, both to improve the body of rules affecting international conduct in time of war and to strengthen their authority, the move may be expected to be fruitful of important results. And the mere fact of this union of purpose, especially in view of the complete harmony of spirit manifested, is of the most hopeful augury. We are getting farther and farther away from the idea of the United States as the "big policeman" of the Continent, and nearer and nearer to that of a true comradeship and coöperation among the American republics, little and big, powerful and weak. Under the influence of such joint undertakings as this, and of such happenings as that of the A B C mediation of last spring, the jealousy which, through so many decades, has from time to time manifested itself in the Southern republics must grow steadily less, and may be expected to disappear entirely in a not distant future. That the United States is preponderant in population, wealth, and power need be no cause of suspicion or dislike; and it will not be, if our tact and good manners in dealing with our neighbors are as unexceptionable as the actual disposition of the nation towards them has been friendly and upright. The advance made towards a perfect understanding, within the past two years, is beyond anything that a short time ago seemed possible.

This is the short session of Congress, and everybody in Washington vows that there must be no extra session. Yet an amount of legislation is already being pressed forward that it would take months to consider duly. Its proponents may desire a short session, but they distinctly would not have it a merry one. If only the important bills now urged were to be enacted into law, Representatives and Senators would have to work like galley-slaves from now till the fourth of March. They would have to give up the holiday recess and have one crowded session of glorious law-making. The congestion, and the pushing and hauling and log-rolling to get the right of way for favored measures, would be terrible. Congress, for the next eleven weeks—really only nine working weeks—will be like the neck of a bottle through which there will be great difficulty in pouring the necessary appropriation bills. But if we are to credit some people, a large mass of other legislation is to be made to gurgle through. But let nobody believe it. The thing is physically impossible.

President Wilson proposed only a modest

programme—as he evidently thought it. In his message to Congress he spoke only of the desirability of passing a couple of pending conservation bills, which are really not contentious; the Philippines bill, which is only a pledge of independence, and could be passed in a day, if the Senate were so minded; and the shipping bill. There's the rub. This whole question of the Government buying and operating ships is too vexed and complicated, the facts are too uncertain, the consequences too perilous, for it to be properly disposed of in the nooks and crannies of time left from other matters in the hurried two months and a half before this Congress expires. If there were no other argument adverse to the measure, this one ought to be conclusive against proceeding with it seriously at the present time. But in addition to this dubious piece of legislation, what do we see? The Immigration bill is made the unfinished business of the Senate. All kinds of military projects are to be pressed upon Congress. It is also actually proposed to amend the neutrality laws of the United States, to make this country stand apart from the established rules of international law in the matter of the duties and the rights of neutral nations and their citizens, all before March 4! Again we say, the thing is impossible.

Complaints are heard that there is not good "team-play" by the Administration at Washington. It is said that the various reports of the members of the Cabinet do not coincide, as closely as they should, with the President's views. Special emphasis is laid upon the report of the Secretary of War, which, in tone at least, if not very seriously in effect, differs from Mr. Wilson's message to Congress. Such lack of coördination is held up by Republican newspapers as a characteristic weakness of the Democrats, who are unfit to rule, and so on. Let's see, however. Was it a Democratic Postmaster-General who, a little while ago, off his own bat, recommended the purchase of the telegraph lines, and was it a Democratic President who squelched the proposal of his subordinate? Ask Hitchcock and Taft. The fact is that there has always been a certain leeway given to the Secretaries. Their own good sense would prevent them from advocating anything radical or startling, without submitting it to the President; but he certainly can't be expected to go over all of their annual reports with a blue pencil in hand. Perhaps he doesn't even read them. There are others who do not.

The most important administrative recommendation made by Postmaster-General Burleson in his annual report is that the rural free delivery service be put upon a contract basis which should replace the system of payment by annual salaries to the carriers. Mr. Burleson directs the attention of Congress to "the fact that this service is entailing upon the public Treasury an annual expense of $40,000,000 in excess of the revenues produced by the service"; and he states that the change would "make possible a saving of from $15,000,000 to $20,000,000 annually." So far as appears in the report, this estimate is based on a comparison of the average cost per mile of the rural delivery service on the one hand and of the "star-route" service on the other; a comparison which does not, on its face, strike one as conclusive, owing to the differences which exist between the conditions in the one set of routes and the other. Furthermore, it is generally understood that many of the "star-route" contracts are now being run at a loss, owing to the growth of the parcel-post traffic. The Postmaster-General strongly urges that "the necessary legislation for placing the rural free delivery on a contract basis be enacted"; but, while it may be quite true that his estimate of the saving that could be effected is correct, it hardly looks as though his data were adequate to establish this fact. Might it not be a good plan to try the experiment of the contract system in a limited but representative area, before going further in the matter? This would be in line with our usual practice in regard to similar postal problems.

Are members of Congress as much in need of expert guidance in legislation as members of State Legislatures? The announcement that we are to have a Federal service analogous to that of a Legislative Reference Bureau comes from the Library of Congress, which follows in this action the policy of many State libraries in undertaking such work without special provision. It is true that in 1906 Congress authorized an appropriation to enable the librarian "to prepare such indexes, digests, and compilations of laws as may be required for Congress." But the Library hopes soon to go beyond the original intent of this authorization. It is to employ a corps of experts in law, competent to analyze, summarize, and compare; an auxiliary corps of translators and indexers; and assistants familiar with the bibliographic apparatus of the law. In advance of any requisition by Congress, these men will systematically study portions of the law, and other material, likely to bear upon proposed legislation; present digests, translations, and comprehensive statements, heretofore seldom or never attempted; while there is a hint in the Library's report that they may ultimately provide for bill-drafting. If the experience of the States is any guide, the personal service of specially trained men will be found valuable. But it is to be remembered that in Congress the committees have themselves usually been efficient in obtaining information on any subject.

The death of William W. Rockhill would be regrettable at any time, but it is peculiarly so because he died outside of our own diplomatic service. His was an exceptionally useful and varied career. Few Americans have ever obtained so wide a knowledge of the Far East as came to him during eight years of diplomatic service in China, in addition to three years in China and Tibet on scientific expeditions in the interest of the Smithsonian Institution. When it is added that he served four years in the State Department, was for two years Minister to Greece, Servia, and Rumania, and was Ambassador to Russia and Turkey from 1909 to 1913, his remarkable diplomatic experience is evident. For special missions such as the representation of the United States in the settlement of the Boxer troubles, he was frequently called upon. Yet when the Wilson Administration came in, this rarely equipped diplomat was permitted to resign. China, however, valued him more highly than his own Government, and he was en route to his post as adviser to the Chinese President when his career was so suddenly and lamentably ended.

There has been an alarming recrudescence of lynching in the South, whether as a reflex of the wholesale killing in Europe or for some other reason. In Caddo Parish, Louisiana, no less than eight mob-murders of negroes have taken place within ten days, because of the murders of two white men and an attack upon a white woman. Two hundred whites placed themselves on the level of the lowest negro criminal by publicly burning an aged colored man who protested his innocence to the end. Not the slightest proof of guilt was forthcoming. One negro woman was severely beaten by the mob. Of the others, several were taken from jails and hanged; but neither the Governor nor the local authorities, it appears, made the slightest effort to stop the lynching or to punish the guilty. In Fairfield County,

South Carolina, they have done better. There, a negro woman was found dead, a victim of the vilest of crimes, and three white men are in jail for it, one of whom has confessed. As the Columbia, S. C., *State* says, this case "promises to test sharply the sincerity of Southern pretensions about the protection of women." It points out that a negro was lynched in the near-by Florence County merely because he was found under a white man's house, and asks: "Confronted with the Fairfield story, what reply shall a Southerner make to Northern critics when they say that talk about 'the one crime' is the shallow and hypocritical pretext for lawless and savage manifestations of race prejudice?"

A word of commendation is called for by the action of the executive board of the United Mine Workers of America in terminating the Colorado strike. Their statement of the reasons for doing so is dignified and sober in tone, and contains—at least so far as the press dispatch shows—no matter calculated to renew bitterness or hostility. That in the struggle itself there was fault on both sides, is universally recognized; but the thing to do now is to make as nearly an absolutely fresh start as possible. This is facilitated by the President's appointment of a Commission to look into any disputes that may arise, and to this fact the Mine Workers' board makes special reference in announcing its decision. With the withdrawal of the Federal troops, and the apparent realization at last by the Colorado authorities of their responsibility for the preservation of order and the enforcement of the laws, there is reason to hope that this most unfortunate episode in our industrial history has really come to an end.

Boston newspapers are indignant over the pardon by Gov. Walsh of John A. Hall, ex-treasurer of the Southbridge Savings Bank. After stealing hundreds of thousands of dollars deposited in the bank of which he was one of the guardians, he has served less than five years of the term of twelve to fifteen years to which he was sentenced. The familiar plea of shattered health was made in his behalf; "if he were confined in State prison for two years more it would kill him." The time for Hall to have avoided this danger to his precious life was when he was out of prison. The Boston *Transcript* says that Gov. Walsh gave "repeated assurances at the beginning of his Administration that he would not tolerate a return by the Council to the flagrant abuses of the pardoning power which had disgraced previous administrations." What makes the action of the Governor and Council the more reprehensible is that the Parole Board had unanimously recommended that the pardon be not granted. There is a good deal of point in the Boston *Herald's* comparison with the notorious Blease: "When Cole Blease, Governor of South Carolina, 'turns 'em loose,' he does so without distinction of condition or social backing." "What excuse," asks the *Transcript*, "has the Governor for his action in the Hall case, and what defence dare the Council offer for thus mocking justice in Massachusetts and making of it a commonwealth where the rich thief may rob the poor without fear of paying the penalty?"

Social-justice shouters should obtain an injunction against the Illinois Supreme Court for committing acts in restraint of their trade. Twenty years ago, the Legislature of that State passed a law limiting women's hours of labor in certain occupations. The Court held the act unconstitutional, backing its decision with an opinion that apparently doomed all similar measures. Since then the Legislature has placed upon the statute books a juvenile-court law, a parole law, a law creating a mines' and miners' board, a structural-ironworkers' act, an employers' liability act, an act requiring safety appliances of common carriers, an act regulating the employment of women in mechanical and mercantile establishments, laundries, and factories. During this time, the Constitution has not undergone amendment, nor has most of this legislation been passed since the raising of the cry for social justice. The Court has simply been reconstituted in the natural process of events, until its Chief Justice is a man who takes occasion to commend the State for its record in regard to legislation of this character.

That the American public is not wholly indifferent to coin designs was shown by its characteristic comment on the buffalo five-cent piece—that the "*E pluribus unum*" could now be translated, "The only one left." But how genuine is the feeling for the artistic value of coins? This is a question which the American Numismatic Society proposes to test. In 1905 it obtained action which gave us Saint-Gaudens's double-eagle and eagle, and Bela L. Pratt's half-eagle and quarter-eagle. Its dealing with our more democratic coins will be a fairer sounding of public opinion. Is it true that the figure of Liberty on our silver coins is "a mere caricature," "an insult both to the Goddess of Liberty and to the beauty of American womanhood"? Is it true that "the nondescript effigy called an eagle cannot compare with the glorious eagles on the magnificent coins of . . . France, Germany, Russia, and Austria"? Many artists will doubtless agree; but will a population whose hands have been subdued to this money since 1892? Washington is said to be congratulating itself on the new designs for paper currency, but that is in different case; the pictures of symbolical figures, of the pioneers, of Indian-fighting, of early locomotives, were out of date, and will be fitly replaced by those of the ocean liner, the battleship, the factory, and the New York sky-line. The pertinency of the Numismatic Society's movement lies in the fact that in 1917 it will again be legal to change the designs without special act of Congress. If it can suggest better types, and quell the suspicion that a numismatist has professional reasons for wishing frequent changes in coinage, it will deserve to succeed.

In Australia, as in Canada, the outbreak of war submerged party animus in Imperial sentiment, though the Commonwealth was then in the throes of a general election. It now appears that the Liberals appealed to the electors partly on the ground that the return of the Laborites would be a vote of censure on the war policy, and an approval of separation from England. This was so unjust that it is not surprising that it carried no force. The six States chose six Senators each, and of the thirty-six the Labor party obtained thirty-one; while their majority in the House of Representatives is overwhelming. The real issue was a labor-preference bill, the Liberal House having tried for fourteen months to pass a measure forbidding the preference of union men on public works, and having been blocked by the Labor Senate. Governor-General Ferguson, at the instance of the Liberal Premier, Mr. Cook, then dissolved both houses. In internal policy, Mr. Fisher, again head of the Labor Cabinet, has announced a programme of Australian nationalism, a higher tariff on foreign goods in protection of native industries, and a referendum for Constitutional amendments to facilitate the suppression of Trusts and the nationalization of public utilities. Evidently, radicalism is in the saddle. As for Imperial relations, the Australian contingent, the Australian navy, and the newly announced preferential tariff rates with England, speak for themselves.

THE BACKGROUND OF THE WAR.

It cannot be said that the French diplomatic correspondence, published in full by the New York *Times* on Sunday, compels anybody to reconstruct his theory of the causes of the war. No positively new facts are supplied. It is simply the former story again, told from another point of view. But this is a very interesting point of view. The French Foreign Office was particularly well served in Vienna, in Rome, and in Berlin; and the reports from the Ambassadors of France in those capitals are highly intelligent and instructive. They do not, perhaps, throw any startling light upon the diplomatic negotiations before the war. Those were already pretty clear in the official publications of Great Britain and Germany, Russia and Belgium. But this French version is valuable in the way of confirming and amplifying what was known. It fills certain gaps in our knowledge, and helps to place the affair in its true perspective.

In his dispatches from Vienna, the French Ambassador, M. Dumaine, aids us in seeing how confident—really over-confident—Austria was. She expected scarcely any difficulty in imposing her will upon Servia. She evidently counted upon Germany's supporting her up to the hilt. Any movement from the side of Russia she believed would come to no more than did the Russian protest in 1909, at the time of the annexation of Bosnia and Herzegovina. Here is an extract from the Austrian *Militärische Rundschau* which Ambassador Dumaine telegraphed on July 15:

> The moment is still favorable for us. If we do not decide upon war, the war we shall have to make in two or three years at the latest will be begun in circumstances much less propitious; now the initiative belongs to us. Russia is not ready, the moral factors are for us, might as well as right. Since some day we shall have to accept the struggle, let us provoke it at once. Our prestige, our position as a great Power, our honor, are in question. There is more still, for, in all probability, it is our existence which is at stake. "To be or not to be"—that is really the big business of to-day.

Passing to another member of the Triple Alliance, we find in the French Yellow Book several significant dispatches bearing upon Italy's attitude during the crisis. Fresh proof is given that the Italian Government was not taken into the confidence of Germany and Austria, in the matter of the Austrian ultimatum to Servia. Ambassador Cambon telegraphed from Berlin on July 25 that he had it from the Italian Ambassador there that "Italy is much surprised, to say nothing stronger, at having been kept out of the whole affair by her allies." And the French Foreign Office pointed out on July 26 that "Italy is bound by the engagements of the Triple Alliance only in matters in which she has been previously consulted." That she felt herself not so bound, when the war actually came, has been made abundantly plain. But in these dispatches we have it put down precisely at the time. On August 1 Ambassador Barrère telegraphed from Rome that the German Ambassador had asked what the intentions of Italy were as regards the war. The Minister for Foreign Affairs, the Marquis di San Giuliano, replied that as "the war had an aggressive character, and was not in accordance with the purely defensive character of the Triple Alliance, Italy could not take part." Here is plainly an important and contemporary opinion as to "who began it."

It is, however, the information sent to Paris from Berlin that is the most suggestive part of the Yellow Book. It dates back a year. We see more clearly than ever before how narrowly Europe escaped being plunged into war in 1913, when the Balkan War was having its troubled *sequelæ*. It was in April of that year that the French War Office came into possession of a secret and official report of the German army. Its authenticity we cannot, of course, vouch for; but it certainly reads like a genuine study of the effect of the new army laws, and of the international situation. The whole document will repay close reading. We can note here only the announcement in advance that "we could not in any way offer Belgium any guarantees of the security of her neutrality." And no one can doubt that the following figure of speech, referring to what the German army would do, came from a German source, whether it was official or not: "The aroused eagle will take its flight and seizing the enemy in its sharpened claws render him harmless." We append a statement also made in 1913, according to Ambassador Cambon, by Gen. von Moltke. He was speaking of the purpose of the General Staff to act by surprise, and remarked:

> The commonplaces as to the responsibility of the aggressor must be disregarded. When war has become necessary it must be waged by ranging all the chances on one's own side. Success alone justifies it. Germany cannot and must not give Russia time to mobilize, or she will be obliged to maintain on the eastern frontier a force which would leave her in a position of equality, if not of inferiority, in front of France. Therefore we must forestall our principal adversary immediately; there are nine chances in ten that we are going to have war, and we must begin war without waiting, in order brutally to crush all resistance.

There is no need to extend the citations. They would only piece out our knowledge of the foregoing period and of the days just preceding the war. It is a terrible impression which the whole must make on a sensitive mind—the military party everywhere gradually getting the upper hand, rulers recklessly playing the game of life or death for millions of the people. We are, as it were, let in at the laying of a subterranean mine, of which the explosion shook the world. And nothing is more disheartening than the way in which monarchs and diplomats pressed on with their plans, in the most perfect assurance that they could not make a mistake, although, as everybody can now see, they were deceived and deluded right and left. This French correspondence once more brings out the fact that Germany utterly miscalculated the action of England. On July 29 Jules Cambon telegraphed from Berlin: "Up to these very last few days people have flattered themselves here that England would remain aloof, and the impression produced by her attitude upon the German Government, financiers, and business men is profound."

LEST WE FORGET FRANCE.

For various reasons, France has seemed during the past two months to have partially dropped out of American thought and sympathies. Throughout August and the first part of September her apparently impending tragic fate was ever present to our minds. Next after Belgium, she most appealed. But since the staying of the tide of invasion north of Paris, we have somehow given less attention to the place of the French in the terrible coil of war. Both the pathos and the crisis of the struggle have appeared to be situated elsewhere. And the great qualities displayed by the French people, during all this time of the trying of their souls, have not impressed themselves upon our consciousness and our imagination so powerfully as they might have been expected to do. At least, so it might be judged from current talk and the drift of discussion and the perspective of the war news.

But few words need be spent upon the military aspects of the matter. That the French army surprised the world, is generally admitted. And it is worth while noting upon what point admiration of it has focussed. This was its splendid recovery of spirit after initial defeats. That was scarcely looked for. When German army after German army drove back the French in August, when there were evidences of uncer-

tainty and confusion in the French military plans, when more than one French general in command was guilty of incompetence or worse, it looked as if the boasts of the German bulletins might be better justified than we liked to admit, and that "Gen. Joffre's army was incapable of further resistance." But all this was soon proved false. The *morale* of the French army reasserted itself promptly; and the valiant and determined and inexpugnable front which it has since opposed to the Germans has wrung tributes from even the enemy. The transformation of the dashing French trooper into the soldier with a bull-dog grip has been described by the President of the French Republic. "As the course of the hostilities has gone its way," wrote M. Poincaré to the Minister of War, "the French soldier, while losing nothing of his impetuosity and courage, has learned by experience to adapt his natural qualities to the demands of the military operations. He maintains an unequalled power on the offensive, and at the same time schools himself in patience and in tenacity." The known facts bear out the assertion.

It is, however, mainly the manifestation of French national character away from the actual fighting that kindles admiration. Even the ardent lovers of France could hardly have counted upon so fine an exhibition. Most of the traits which we proverbially and all too lightly associate with the French people have gleamed by their absence. There was little that looked like unbalancing excitement or panic of soul. Nor was there much posturing or rhetoric. In the face of what was certainly a fearful danger, and what might easily result in a national catastrophe, France was calm. The people summoned all their reserves of strength and capacity to endure, and gave the world an inspiring example of a nation prepared to drain the bitterest cup without whimpering. The indomitable spirit with which men and women in France made ready to go through inevitable sufferings and misery, together with their energy in resisting the thrust of disaster at every point possible, their fertility of resource and of hope in the dark days, and the fine resilience with which they bent back like tempered steel to their assigned tasks, will compel many a hasty critic to revise his opinion of French lightness and instability. Never did France rise to a higher stature.

To the attitude of her men of science, her writers, her professors, separate reference may be made. Amid the devastation of war, France has clung with pathetic eagerness to her art, her literature, her universities. The University of France opened its doors as usual. What though hundreds of its students were with the army and many of its professors were doing military service? It was for the University to go on with its work in dignity and serenity. The great tradition must be maintained. As it is expressed by René Doumic, who himself passed his first year at college in a besieged Paris, in 1870, "the University does not admit that a single one of those who have the honor to belong to it is not at his post"—whether that post be in a trench or in a classroom. Either way, the magnificent union of French hearts is shown, as is also the "nobly humane" nature of the culture for which France stands steadfast.

All that we have said can be admitted by even those most scrupulous in guarding against unneutral conduct during this war. If the German Crown Prince, if the Kaiser himself, can pause in the midst of conflict to bestow praise upon the high qualities exhibited by the French, Americans need not feel it necessary to stint their applause. For it is a kind of addition to the moral assets of the world which France has been making in the course of these terrible months. In being forced to think better things of the French nature, we shall be prevented from ever thinking meanly of human nature in general. France has unlocked her soul for the nations to see; and so doing helps us to understand of what depths and what heights, what tragedies and what splendors, mankind is capable.

THE REPORT OF THE TREASURY.

The occasions are not numerous when the annual report of the Secretary of the Treasury—usually a matter of routine estimates and forecasts—embodies a chapter of great historic interest. It is apt to do so only at times, such as 1894 or 1907, when the Government has had to intervene with protective measures in a great economic crisis. This, in a notable degree, has been the character of the period since the European war began; the Treasury report which was submitted to Congress last week is the record of the Government's part in meeting the financial storm which came with the outbreak of hostilities.

The high service rendered by the Administration in that crisis, through the promptness, soundness, and vigor of the measures taken, has been fully and frankly recognized, even by political opponents. We have in mind the instance of a financier long hostile to the Wilson Administration, who, when asked in the early days of August if our lack of a great financial leader in that crisis was not unfortunate, replied that we had discovered such a leader in President Wilson. Certainly, the inspiration and the impetus for each of the expedients adopted to protect the country's credit situation came primarily from the White House. The cordial personal coöperation of the Administration with men in the high places of finance not only simplified the programme of relief, but was full of favorable omen for the future. It may easily have foreshadowed, as so many other signs of the times have done, a new era in the relations of Government and "Big Business."

Secretary McAdoo's report reviews the measures taken to meet the midsummer crisis. On July 31, the day when the sudden closing of the Stock Exchange pointed out the character of the situation, the Treasury Department publicly announced its purpose to "help, as far as it legitimately may, in New York or in any other part of the country where it becomes apparent that assistance is needed"; and it proposed the immediate recourse by the banks to the emergency currency of the Aldrich-Vreeland Act. A day later, the Treasury called a conference of Clearing-House authorities, and on August 2 the Secretary came in person to New York to arrange with the leading banks for protective measures.

There was issued to national banks at New York, as the Treasury report now shows, $141,228,000 of this emergency currency, and $228,330,040 throughout the whole country. To this expedient, applied with the greatest promptness, is unquestionably to be ascribed the absence of money-hoarding and of a premium on currency, such as marked our previous financial panics. Indeed, the word "panic" can hardly be applied with propriety to our financial history in the past four months. It was stopped at its beginning, as was the simultaneous London panic, by the public evidence that the banks, with the Government behind them, were united in maintaining the credit situation. The redemption and retirement of these emergency issues, Mr. McAdoo believes, "will not present a difficult problem." In point of fact, more than $100,000,000 has already been retired by the New York banks alone, and upwards of $130,000,000 in the whole United States.

It was directly under the auspices of the Treasury, early in August, that committees of well-known business men were named, after a general conference at Washington, to confer and coöperate with the Government

as to the means of solving the unprecedented problems surrounding foreign exchange, ocean transportation, and war-risk insurance. In an attempt to surmount the very great difficulties in these matters the greater part of the work was properly committed to the banks, as in the case of the $100,000,000 fund to take up New York city's foreign obligations, and the further $100,000,000 gold fund, designed for the regulation of the foreign exchange market. But in each of these expedients the Administration gave essential help through the new Federal Reserve Board, promptly and wisely selected by the President; and in such other questions as the war-risk insurance, which for the time was all but prohibitive to our foreign trade, it obtained from Congress the prompt action which was necessary. Not least important was the admitted fact that every unsound and extravagant plan urged on the Government in the excitement of the crisis was summarily rejected.

We have mentioned only a few of the protective or remedial measures furthered by the Government, in conjunction with the financial community organized under the auspices of the Government. The Treasury report is abundantly warranted in declaring that the averting of an actual panic, with the gravest after-consequences, was distinctly due to "the prompt and effective action of the Treasury Department, with the cordial and intelligent coöperation of the banking and business interests of the country." Mr. McAdoo takes a hopeful view of the financial and industrial outlook, and in particular "looks forward with the greatest confidence" to the effects of the new reserve banking organization "upon American enterprise and American business." There are, indeed, few people who to-day will dispute the statement that the effective working establishment of that system—due to the resolute pressure of President Wilson—has occurred at the ideal psychological moment.

The provisions of the Federal Reserve law, as enacted, never threatened inflation of the currency. But there were many intelligent observers who had expressed misgiving as to possible over-expansion of credit if the system should happen to go into operation during a business "boom." There can be no such danger under the present circumstances —in which, indeed, the business public's knowledge of the facilities which now exist for granting larger credit, if required, is the surest guarantee that uneasiness over the general situation will be relieved, and borrowings kept down to actual needs.

A WESTERN NATURE POET.

The distinction of Madison Cawein, whose death is announced from Louisville, was as the best poet of nature the West has produced, and one of the best in the last generation in America; it was his limitation that he was little but a nature-poet. Of the fact that his work lay virtually in one field the critics have indeed made too much. It is true that his volumes, "Myth and Romance," "Weeds by the Wall," "A Voice on the Wind," "Kentucky Poems," "Days and Dreams," are all chiefly of nature, often its mythological or romantic associations, but more often purely descriptive—written to render an æsthetic picture. But his descriptions are not purely external or wanting in poetic insight, and their recurrence is far from tiresome. Invited to estimate Cawein's poetry, Mr. Howells tells us that he asked, "Why always nature poems? Why not human-nature poems?"

But in seizing upon an objection so obvious that I ought to have known it was superficial, I had wronged a poet who had never done me harm in the very terms and conditions of his being a poet. I had made his reproach what ought to have been his finest praise, what is always the praise of poetry when it is not artificial and formal. I ought to have said, as I had seen, that not one of his lovely landscapes in which I could see no human figure but thrilled with a human presence penetrating to it from his most sensitive and subtle spirit until it was all but painfully alive with memories, with regrets, with longings, with hopes, with all that from time to time mutably constitutes us men and women, and yet keeps us children.

And it could be pointed out that the poet at times stepped successfully outside the narrower circle. "The Feud" is a dramatic episode of Kentucky; "Ku Klux" is as graphic; there are one or two real dramas, and lyrics in numbers—for Cawein was over-prolific—full of a rather pensive interpretation of youthful romance, with its incidents chosen impartially from Greece, England, the Germany of his ancestors, or Kentucky.

To analyze the qualities which made Cawein unique in his descriptions of Western nature, and discover why, among the Hays, Hoveys, Rileys, Piatts, Fieldses, Maurice Thompsons, he should hold his own place, is an interesting inquiry. No other had either his taste for nature or his exact eye. In this scientific age, when Maeterlinck makes an exhaustive study of the bee an illustration of his poetic philosophy, and Tennyson's successors know not only that ash-buds are black early in March, but many other botanical facts, he was our one distinctive poet-naturalist. Of dittany and the yellow puccoon he has written exactly, of mallow, ironweed, bluet, and jewel-weed, the cohosh, the bell-flower, the oxalis, the Indian-pipe; from his books a manual of Kentucky flora and fauna might be made. He is helped by a sense of the atmosphere of place that pervades his larger landscapes; and by a knack for the felicitous epithet—an inspiration, Howells remarked, "for the right word, and the courage of it, so that though in the first instant you may be challenged, you may be revolted, by something you thought uncouth, you are presently overcome by the happy bravery of it." Both appear in "The Raincrow":

Can freckled August—drowsing warm and blonde
Beside a wheat-shock in the white-topped mead,
In her hot hair the oxeyed daises wound—
O bird of rain, lend aught but sleepy heed
To thee? When no plumed weed, no feather'd seed
Blows by her; and no ripple breaks the pond,
That gleams like flint between its rim of grasses,
Through which the dragonfly forever passes
Like splintered diamond?

Drought weighs the trees, and from the farmhouse eaves
The locust, pulse-beat of the summer day,
Throbs; and the lane that shambles under leaves
Limp with the heat—a league of rutty way—
Is lost in dust; and sultry scents of hay
Breathe from the panting meadows heaped with sheaves—
Now, now, O bird, what hint is there of rain
In thirsty heaven or on burning plain
That thy keen eye perceives?

And this brief quotation gives little hint of Cawein's fidelity as a naturalist.

Something like this zest for nature we have had from the Merrimac and Hudson—why not more from the Wabash and Mississippi? In explanation of Cawein's narrow vein, the natural theory has been the thinness of the social world about him; he was driven to nature-verse by the same want of background and history of which Hawthorne complained at an earlier period in the East. But so great is the modern Western solicitude for a poet to express its native social ideals and spirit that the theory hardly holds. What is the glory that is attributed to Riley? That his very sentimentality is the expression of a sectional attribute, that his verse is rooted in the soil by its dialect and content. Piatt's "Western Windows" were acclaimed because they looked out on real Western life. Hay's "Pike County Ballads" had historical truth. In reality, Western poetry has been less inclined to neglect history and life for nature than to do the opposite; and this tendency is to-day as strong as ever.

Chronicle of the War

The official dispatches from Paris and Berlin give a clear idea of the nature of the fighting in France and Flanders and of the difficulties which the offensive of the Allies must encounter. The Germans, we may assume, have not been idle during their long occupation of their present lines, and they will have made all preparations in case of a retreat. Belgium, in fact, may be regarded as a huge field fortress, seamed and intersected with trenches, in many places reinforced with steel and concrete, and having guns already mounted or ready to be mounted at various defensive points. It is not surprising, therefore, to read in the French official statements of progress achieved in various places of from one hundred to six hundred yards. A thousand yards in this kind of warfare represents a notable advance. Progress of a mile might almost be described as a sweeping victory.

Under these circumstances, although we may rightly speak of the Allies as having assumed the offensive, we can probably look for no considerable advance in the near future. Progress has been made in many parts of the line since we wrote last week, notably in completing the clearance of the Germans from the west bank of the Yser, but it has been so small as to be barely perceptible on any but a large-scale map. Gen. Joffre's method is patient and thorough: trenches are taken one at a time, and the new positions are consolidated before any further advance is undertaken. A good deal of the fighting recently has consisted of artillery duels, and the French field guns apparently have continued to demonstrate their superiority over the German. The offensive of the French and British is serving its main purpose in preventing the withdrawal of more German corps for service on the eastern front, and this is probably all that it expects to achieve until the arrival of strong British reinforcements shall give to the Allies a considerable superiority of numbers.

One of the greatest surprises of this surprising war was the announcement at the beginning of the week of what looks like a decisive Servian victory, so far as any isolated success can be called decisive. After the capture of Belgrade on December 2, although the actual loss of the city need not necessarily have had a serious effect on the military situation, it was generally assumed, in view of the reports of successive Austrian victories and of the occupation of the northwestern corner of the kingdom, that Servian resistance was virtually broken down. The entire army of Servia consisted at the beginning of the war of possibly rather more than a quarter of a million men. Depleted by the losses incurred in resisting two successive invasions by Austria and in conducting its own aggressive campaign into Bosnia in August, it could hardly be expected, with only the assistance of the small Montenegrin army, to rally sufficiently to stem the tide of the third Austrian invasion. Yet this is what has happened. The beginning of a series of Servian victories which resulted in the Austrian evacuation of Belgrade on Sunday or Monday, was announced in a dispatch dated December 8, which stated that the Austrian centre had been broken and the towns of Valjevo and Ushitza retaken. The capture of Kosmai, thirty miles south of Belgrade, was announced on December 12. The right wing of the Austrians, which had been smashed by the breaking of the centre, retreated across the Drina into Bosnia and was there attacked by the Montenegrin army near Vishegrad and again defeated. The completeness of the Servian victory is amply confirmed by official announcements from Vienna, which admit the defeat and indicate that the Austrian forces will be content to remain on the defensive.

It is interesting to note the manner in which the various campaigns act and react the one upon the other. The Servian victory helps to explain much that was puzzling in the development of the Russian strategy. Reports were published ten days ago, when the fortunes of Servia seemed to be at their lowest ebb, that Russian reinforcements had been dispatched from Archangel and landed at Antivari. Archangel is apparently the source of many rumors, and this one was, if anything, a trifle more absurd than that which transported Russian troops to the north of Scotland and thence to the battlefields of Belgium. At the same time, Russian strategy appears to have had a good deal to do with the Servian victory. In the light of what has happened on the Drina, we can explain the Russian incursion into Hungary, which has appeared hitherto to have been undertaken without definite object in view, and we can also explain the turning of the tide in this region in favor of Austria and the casual mention in the official statement from Petrograd of Austrian columns "coming down the northern slopes of the Carpathians." The aggression into Hungary appears to have been undertaken mainly with the idea of relieving pressure on the small Servian army. If so, the plan was entirely successful, for we learn that in order to meet the invasion three of the seven Austrian army corps engaged against Servia were detached and sent to Hungary. Hence the victory of the Servian army, whose powers of recuperation were doubtless underrated by Austria; hence, too, the reverse suffered by the Russians in Hungary, a reverse which we may assume was expected and deliberately faced. Once again Russia has deserved well of her allies for her readiness to sacrifice herself for the good of the common cause.

There need be no difficulty in reconciling Austrian reports of the occupation of Neu Sandec, forty miles southeast of Cracow, and of other towns still further away, with the Russian contention that Cracow is still being hard pressed. The Austrian troops that have occupied Neu Sandec are presumably those which have pursued the Russians across the Carpathians from Hungary, and the Russian forces may be supposed to be presenting two fronts to the enemy, one facing south towards the Carpathians, the other west, menacing Cracow. Elsewhere the progress of the campaign appears, as we write, to have again taken a turn favorable to Russia. In the centre in Poland, on the line between Lowicz and Lodz, stonewall positions appear to have been established similar to those which exist in Flanders, the German advance upon Pietrkow seems to have been checked, and the evacuation of Lodz to have had no appreciable effect on the military situation. To the north the German offensive operating from Mlawa has failed, if we may credit unofficial reports, somewhat disastrously, and official statements from Petrograd speak of the German forces in this quarter being pushed steadily back. The movement, which was proclaimed as an attack on Warsaw, can in any case only have been intended as a diversion, since the number of troops engaged in it, two army corps, was too small to contemplate a serious offensive against the powerful fortress of Novogeorgievsk, which guards the path to the capital.

On the sea Great Britain has gone far towards redeeming the succession of disasters that she has suffered, and it seems not unfair to assume that the reinstatement of Sir John Fisher as First Lord of the Admiralty and the appointment to an advisory position at the Admiralty of Sir Percy Scott are in part responsible for the assumption of a more astute and a more enterprising strategy. On December 8, off the Falkland Islands, in the South Atlantic, a British squadron under the command of Vice-Admiral Sir Frederick Sturdee encountered the German squadron, under Admiral Count von Spee, which on November 1 sunk the Good Hope and other British vessels. An engagement ensued, in which the German cruisers Scharnhorst, Gneisenau, and Leipzig were sunk in a running fight which lasted for some five hours. Some survivors were rescued from the Gneisenau and the Leipzig, but the majority of the crews of the German vessels, including Admiral von Spee, presumably went down with their ships. The British casualties were light, consisting of seven men killed and four wounded. The composition of the British squadron is not known, but it may be assumed that it included powerful battle cruisers of the Invincible type, which outclassed any of the German ships. The lighter cruisers, Nürnberg and Dresden, of the German squadron, apparently tried to avoid battle, but the Nürnberg was pursued and sunk late the same day. The Dresden succeeded in escaping and took refuge at Punta Arenas, a port of Chili in the Strait of Magellan. There or elsewhere she will probably be interned. The destruction of this squadron virtually frees the seas of German warships, only the small cruisers Karlsruhe and Bremen and the converted cruiser Kronprinz Wilhelm remaining at large.

Another naval exploit of considerably less intrinsic importance but infinitely more spectacular, and valuable in the reassuring effect that it will have in England as to the efficiency and enterprise of the navy, was the sinking by a British submarine in the Dardanelles, on December 13, of the Turkish battleship Messudich. The feat evidently involved a fine display of seamanship and daring. Submarine navigation in the Dardanelles is rendered exceptionally difficult on account of the narrowness of the channel and the force of the currents. In this instance, the difficulties were increased by the fact that the Dardanelles have been freely mined. It is stated, in fact, that the submarine B-11, under the command of Lieut.-Commander Norman B. Holbrook, dived successively under five rows of mines in reaching its goal. In escaping after successfully torpedoing the battleship it was subjected to gun fire from the forts and at one time remained submerged for nine hours. The actual loss of the battleship is not a particularly serious one, as she was a very old vessel and was useful only for purposes of defence, having been built in 1874 and reconstructed in 1903.

Foreign Correspondence

SIR JOHN FRENCH'S QUARTERS—LONDON DARKER THAN EVER—THE PARLIAMENTARY TRUCE.

By SIR HENRY LUCY.

WESTMINSTER, November 28.

It is well to know, as I learned yesterday from an officer temporarily returned from the front, that, during his brief illness, Lord Roberts was lodged in comfortable quarters, and had the advantage of the immediate attendance of skilful doctors. Two were on the spot, and a third was hurried down from a hospital in Boulogne. Sir John French has had the good fortune to obtain the tenancy of a comfortable château, the home of a well-to-do Belgian. His old chief and much-loved friend was his guest during his brief stay "among the soldiers he loved and within sound of the guns." "Where is the château?" I asked, an idle question certainly put without guile. My friend, hitherto pleasantly communicable, immediately dried up. "Not far from the fighting line," he said, with a quiet smile. That was near enough for any one, including German aviators, to know.

The depth of absurdity to which official man can sink is indicated by the action of the Press Censor. A parallel is found in the proceedings of whosoever is responsible for the darkening of London. Apprehension of a visit from a Zeppelin to the metropolis is a legitimate source of pleasure to the Germans. It may be well founded. But some of the precautions taken suggest an old lady in a fright. Special precautions have been taken to screen Buckingham Palace from the observation of hostile aviators. In common with other thoroughfares only a few of the electric lamps in the Mall are burning, and the light is turned half on. Within the last week another happy thought has struck the watchful custodian. He has had the top of the lamp blackened so that no light is thrown upward.

That is a precaution common to all thoroughfares. But behind and in front of Buckingham Palace lurk two particular dangers. One is the pretty stretch of water in St. James's Park. The other is the lake in the private ground in Buckingham Palace garden, whereon upon rare fête days watermen arrayed in royal scarlet row delighted guests. It is recognized that, on moonlight nights, these might serve as range-finders for the aviator looking for the palace. The water has accordingly been drawn off, unsightly excavations showing where once flowed ornamental stretches of water. Nor is this all. An added attraction to the statue of Queen Victoria, a year or two ago set up in front of the Palace, was a fountain whose clear waters splashed into a marble trough. This dangerous feature of the roadway has also been removed.

This is all very well for Buckingham Palace, but what about the Houses of Parliament, Westminster Abbey, and the miles of houses, public buildings, and warehouses through which the Thames glides, say from Richmond to Greenwich? If a German airman wants to find his way about London at night he will not care for the lakes in St. James's Park and the gardens of Buckingham Palace, or even for the fountain that plays round the base of the statue of Queen Victoria, so long as he has the silver Thames.

Among minor public inconveniences arising out of the fussiness that grievously depresses life in London just now, is the silencing of clock chimes and the non-lighting of familiar clock faces. "The curfew will not sound to-night" from Big Ben, nor, indeed, will any other bell through the round of the twenty-four hours. Silent also are the chimes of Westminster Roman Catholic Cathedral, which formerly, to the great convenience of a circle of householders clustered round it, thrice told to a second the time of day. If the incessant roar of the streets ascending to high heaven were compulsorily hushed, these innocent chimes might well be left to perform their useful public service. The conduct of the authorities in these respects recalls a familiar pantomime scene wherein, riot breaking forth in a crowded group, the policeman, selecting the smallest, most innocent boy, hales him off to prison.

Among the latest edicts issued in the name of public safety is one directing railway passengers to draw down the blinds of the carriages in which they travel at night. Another reduces the illuminating power of electric lamps on the upper staircases of flats to the proportion of a farthing dip. Meanwhile, over studiously darkened London there from time to time flashes the uncanny gleam of a searchlight. To the simple-minded it would appear that this phenomenon would be more useful to the man in charge of the Zeppelin than top lights in London flats, or even the beaming countenance of "Big Ben."

Up to the hour of adjournment for the Christmas recess the truce established between political parties in the House of Commons was loyally maintained. The Chancellor of the Exchequer, presenting a budget for whose stupendous proportions there is no parallel, was unhampered by opposition. With characteristic adroitness he "nobbled" the official financial spokesman of the Opposition, inviting Mr. Austen Chamberlain to a private conference upon details of the budget. It is not certain that these halcyon times will be renewed when Parliament reassembles in the New Year for what may be regarded as the dispatch of ordinary business. As the price of their coöperation in meeting the financial exigencies of the war the Opposition demand that while it lasts no controversial measures shall be put forward by the Government. Mr. Asquith has agreed to this as a general principle. But the Abolition of Plural Voters bill, a relic of two preceding sessions, will certainly be carried through the automatic stage provided by the Parliament act that will add it to the statute-book in good time for the general election.

Ministers are pledged to make a further legislative effort to carry a bill amending the Home Rule act in the direction of satisfying the Ulster members. But they are not bound to persevere to the end if such persistence should threaten continuance of the peace and order which just now reign at Westminster. The scheme of Home Rule enacted before the prorogation was of their devising, and they have paternal satisfaction with its completeness and efficacy. If they can by amicable settlement meet objections raised in quarters where the bill was from the first vigorously fought, they will be glad. But they are not likely to show themselves enthusiastic in the matter, nor disposed in present circumstances to set a light to the funeral pyre of controversy.

The Prize Court

AN OLD INSTITUTION REVIVED BY THE WAR—CHANGES IN PROCEDURE.

There are two broad points of view from which the British Prize Court may be regarded—the historical and the practical. When Sir Samuel Evans, the President of the Admiralty Division, took his seat in the Prize Court on September 4, 1914, he was, after a lapse of sixty-four years, renewing the work of Lord Stowell and of Dr. Lushington. A distinct historical continuity marks the British Prize Court, for though in 1914 the place where it was held was changed, the court itself was in effect the same as that in Doctors' Commons, under the shadow of St. Paul's Cathedral, over which the monumental figure of Lord Stowell presided for so many years during the Napoleonic wars. It was Stowell who, fortunate in his time, and specially fitted for his task, formulated English prize law in a series of judicial decisions remarkable alike for their clear reasoning and their admirable phraseology.

If we look back from the eighteenth century the Prize Court is to be seen a distinct legal institution, for the High Court of Admiralty has, in time of war, always been the court which administered British prize law. The High Court of Admiralty had, in fact, from the time it became a legal tribunal, two distinct kinds of jurisdiction—prize and instance—the latter word covering what is popularly called Admiralty business, that is, disputes arising out of collisions, salvage services, and the like. The origins of the prize jurisdiction of the Admiralty Court were obscure until Mr. R. G. Marsden made some careful researches into the records of the court, the results of which are contained in two volumes of the publications of the Selden Society, and in two papers in the *English Historical Review*, in 1909 and 1910, which should be republished in separate form.

We must picture the Lord High Admiral in mediæval times, one who from his position became an arbiter in maritime disputes which included questions of prize. From the personal jurisdiction of this great official to the delegation of his judicial authority to a legal deputy is a step which, gradually becoming a common practice, links the present court with the prize jurisdiction of the Lord High Admiral in the fourteenth century. So that in the Prize Court now sitting in the Law Courts in the Strand we see one of those interesting British institutions which, even amid the changes of time, unite us to the mediæval age.

Several circumstances have caused the British Prize Court to lose the personal atmosphere which surrounded it in former days. For one thing, the private captor has disappeared. In the Napoleonic wars privateers covered the high seas, and the condemnation of their prizes—the proceeds of which went into the pockets of the owners

and crews—occupied much of the time of the Prize Court. But the officers and crews of commissioned ships of war also obtained the cash result of their captures. The Declaration of Paris put an end to the privateer, and an order in Council of last August abolished prize money for the royal navy. The Crown, in other words, the Treasury, is therefore now alone interested in prize proceedings, though it may be mentioned that a regulated bounty is to be given at the end of the war to officers and men of the royal navy.

The ascendency of Great Britain at sea during the present war has had the effect of preventing German and Austrian vessels from sailing the seas, and the two ports of Germany, Hamburg and Bremen have been inaccessible to neutral shipping. The result has been that, except for a few days at the beginning of the war, there have been no maritime captures. The ships which have been brought before the Prize Court have almost all been seized in port, and these have not been condemned and sold, but an order has been made for their detention until the end of the war. This procedure is novel in the Prize Court, and is one which would somewhat have astonished Lord Stowell. Whether the order is made in pursuance of the Hague Convention No. 6 (1907) is doubtful, for it has not yet been judicially decided whether this convention is binding; but as the Prize Court has a general power to make any order it deems proper, it has not been necessary to settle the former interesting point. There are those who consider that the detention of enemy vessels might well be effected by administrative act, and certainly, as the primary object of the Prize Court is to condemn enemy property and to dispossess an enemy owner of it, there appears to be no practical object in bringing a suit in the Prize Court merely for an order for detention.

The cargoes which have been the subject of prize proceedings have also for the most part been seized in port, and in most cases in British ships. There has resulted this curious state of things, that, while enemy goods in neutral vessels are immune from capture, those in British vessels are liable to seizure. In regard to these goods some intricate and difficult points of commercial law have arisen. Modern forms of dealing, especially as concerns the advance of money on bills of lading and the practice of through bills of lading, have made the actual legal ownership of goods at the time of seizure a question of difficulty. These questions were unknown in former times, and the recent decisions on them relate rather to commercial than to prize law. In the latter field the preëminence of Lord Stowell's decisions as fundamental declarations of English prize law has been, perhaps, an outstanding feature of the work of the court.

If a practitioner from Doctors' Commons, one of the civil lawyers of the past, could revisit the Prize Court, he would be struck not by a change of law, but by a change of procedure. A new code of rules, which had been long in preparation, came into force at the beginning of the war; they have abolished many antiquated forms of procedure, especially that of taking evidence from a captured ship on "standing interrogatories." The procedure is simple and untechnical, for, after all, the object of a prize suit is in itself simple, and there is no reason why the methods by which a decision is obtained should be either involved or lengthy.

E. S. Roscoe.

Book Notes and Byways

MARTIN LUTHER AND ENGLAND.

An extremely rare book, found in the Bodleian, but not in the British Museum, is "M. Luthers Sermon on the Keys and of Absolution, on John xx. 21, 22, translated by R. Argentine. Ipswich. 1548." The name of the translator as here given is a pseudonym, the last word, "Argentine," meaning simply "of Strassburg," which in Latin is known as Argentina or Argentoratum. The problem is, then, to find an Englishman one of whose names begins with R, and who lived for some time at Strassburg. The first name that occurred to me was that of Friar Roy, Tyndale's helper and a translator of other Lutheran works into English. He lived long in Germany, and spent some time at Strassburg, but, as he disappears from sight in 1532, and as Thomas More relates that he fell a victim to the Portuguese inquisition in that year, the present translation could not have been by him unless it was a reprint of an earlier work now unknown. This is so improbable as to make further search desirable. I now think that the translator was Richard Hilles, an English Protestant clergyman who spent several years at Strassburg with Bucer. By contemporary letters he can be traced there in 1546 and from December 8, 1547, to August 22, 1548. As he set out for England on this date, nothing is more likely than that he carried with him a version of Luther's sermon, to be printed immediately on his arrival. By his friends he is often referred to by his first name only, and there is nothing strange in his taking the initial R rather than H in finding a nom de plume.

In the very same year Walter Lynne, a London printer, himself translated, published, and dedicated to the Princess Elizabeth another of Luther's works, namely:

A frutefull and godly Exposition and declaration of the kyngdom of Christ and of chrysten lybertye made upon the words of the Prophete Jeremye In the xviii chapter, with an exposycyon of the viii Psalme, intreating of the same mater by the famous clerke Doctor Martyn Luther, whereunto is annexed a Godly sermon of Doctor Urbanus Rheglus upon the ix Chappter of Mathews. . . . Translated out of the hyghe Almayne. Gwalter Lynne. London. 1548.

In the following year Lynne published another of Luther's writings under the title:

A briefe collection of all such textes of the scripture as do declare the most blessed and happie estate of them that be with sycknes. . . . Whereunto are added two fruitfull and comfortable sermons made by the famous clarke doctor Martin Luther. . . . G. Lynne. 1549.

No more English versions of the Reformer's works were printed during the reign of Edward VI, and only one during the reign of Mary. This was from Luther's *Vom Greuel der Stillnesse:*

A sermon of the great blasphemy agynst God whych the Papystes do use reading this Antechrystian Canon in theyr Mass.

No date, place, or name of printer is given. The British Museum catalogue places it in the year 1554, and the appropriateness of its subject to the reign of the Catholic queen is obvious. It may have been printed on the Continent, as was Tyndale's New Testament and many of his works. Even under the Protestant Edward, in 1550, an Oxford scholar, Francis Dryander, though of the reformed faith, went to Basel to get books printed.

An estimate of the influence of Luther's writings in England in the sixteenth century must note that they furnished the originals for the translation of the English Bible, for many hymns, and for the Thirty-nine Articles. It is a well-known fact that the first complete English Bible (1535) frankly stated on its title-page that it was "faithfully translated out of Douche and Latyn," the Dutch being, of course, Luther's German. Comparison of the texts amply bears out the fact that both Tyndale and Coverdale leaned very heavily on the Reformer. On the other hand, the assertion that Tyndale was at Wittenberg and knew Luther personally, though made by his contemporaries Edward Lee, Thomas More, and Cochlæus, and repeated by Froude, Demaus, Momfret, Gairdner, and many others, is, in my judgment, certainly false. Not only is there no mention of this visit in the records of the University of Wittenberg, or in the voluminous correspondence of Luther, or Melanchthon, or Jonas, or Bugenhagen, or any other resident of the city, not only is there no mention of ever seeing Luther in all Tyndale's writings, but we have his own denial: "when he [More] saith Tyndale was confederate with Luther, that is not the truth."

Some time before 1539 (the date is given by a list of prohibited books drawn up in that year) Miles Coverdale published "Ghostly Psalms and Spiritual Songs, drawn out of the holy Scripture." Mr. Herford has already noticed that some of these hymns were also drawn from Luther. Having made a more thorough study of the subject, I have noted the following parallels:

GERMAN: ERLANGEN EDITION OF LUTHER'S WORKS, VOL. 56.	ENGLISH: REMAINS OF MYLES COVERDALE, 1846.
Nun freut euch, p. 309.	Be glad now, p. 550.
Psalm xii, p. 311.	Do., p. 567.
Psalm xiv, p. 312.	Do., p. 581.
Psalm cxxx (shorter form), p. 313.	Do., p. 577.
Psalm lxvii, p. 318.	Do., p. 580.
Lobgesang auf dem Osterfest, p. 319.	Easter Song, p. 563.
Ostergesang, p. 321.	Another Easter Song, p 563.
Ten Commandments, p. 322.	Do., p. 544.
Another Ten Commandments, p. 324.	Do., p. 545.
Komm Heiliger Geist, p. 330.	Come Holy Spirite, p. 542.
Lobgesang Simeons, p. 331.	Nunc Dimittis, p. 566.
Glaube, p. 333.	Creed, p. 546.
Psalm cxxviii, p. 335.	Do., p. 573.
Psalm cxxiv, p. 336.	Do., p. 571.
Lobgesang, p. 337.	Of the Holy Ghost, p. 566.
Media vita, p. 338.	Media vita, p. 554.
Ein Feste Burg, p. 343.	Deus refugium, p. 569.

For the sake of comparison the first verse of the last-mentioned poem may be given:

> Our God is a defence and toure,
> A good armoure and good weapen,
> He hath been ever our helpe and succoure

In all the troubles that we have been in.
Therefore wyl we never drede
For any wondrous dede
By water or by londe
In hilles or the see sonde
Our God hath them all in his houde.

Ain feste burg ist unser Gott,
ain gutte wör un waffen,
Er hilfft uns frey aus aller not,
Die uns yetzt hat betroffen.
Der alt böse feynd,
Mitt ernst ers yetzt meint,
gross macht un vil list
sein grausam rüstung ist,
auff erd ist nicht seins gleichen.

Though the wording of the two is not very close, the identity of the metre, save in the rhyme of the last line, makes it certain that Coverdale used the famous German hymn.

It is not generally known, and would hardly be agreeable for the "Catholic" party in the Episcopal Church to learn, that Luther had a finger in the Thirty-nine Articles. Such, however, is the case. When Henry VIII's ambassadors, Foxe, Bishop of Hereford, and Nicholas Heath, visited Wittenberg in 1536, they brought back with them a set of seventeen articles, drafted by Melanchthon and approved by Luther, largely founded on the Augsburg Confession. Two years later, at a conference of the German ambassadors, Boineburg and Myconius, with English divines in London, these were digested into thirteen articles, which became the basis of the Forty-two Articles of Edward VI, and thus of the Thirty-nine Articles of Elizabeth. (*Cf.* G. Mentz: *Die Wittenberger Artikel von 1536.* Leipzig. 1905.) PRESERVED SMITH.

Correspondence

"POUR LE FRONT."

MONSIEUR LE DIRECTEUR: Vous avez bien voulu attirer l'attention de vos lecteurs vers l'œuvre que la comtesse Joachim Murat a appelée "Pour le Front." Je vous en remercie bien sincèrement, car je connais cette œuvre qui est des mieux conçues et des mieux dirigées, et je puis vous assurer qu'elle rend de grands services. Grâce à elle, les maux de la guerre sont adoucis à l'entrée d'un hiver rigoureux, et beaucoup de vies humaines lui doivent leur conservation. C'est une heureuse pensée qu'a eue la comtesse Murat d'envoyer directement au front, par les moyens les plus rapides, les nombreux et précieux objets qu'elle doit à la libéralité des souscripteurs et qu'elle a hâte de faire parvenir à leur véritable addresse, qui est celle des malades et des blessés. Et que de maladies elle prévient!

Je vous remercie donc de la publicité que vous avez donnée à cette œuvre éminemment bienfaisante: et ce qui augmente ma reconnaissance est que je crois voir dans votre initiative une marque de bienveillance dont je suis très touché. Notre cause se dégage maintenant en toute clarté des calomnies dont elle a été l'objet. La France n'a pas voulu la guerre; elle n'a rien négligé de ce qui pouvait l'empêcher et lorsque enfin elle a dû la subir puisqu'on la lui avait declarée, elle l'a faite conformément aux règles du droit des gens, humainement et loyalement. On a osé l'accuser d'avoir voulu et préparé la violation de la neutralité belge, alors qu'elle n'avait même pas fortifié sa frontière commune avec la Belgique, la voyant assez défendue par la sainteté des traités. Si je proteste contre cette allégation au milieu de tant d'autres également fausses, c'est que nous y avons été, en France, particulièrement sensibles, parcequ'en nous attribuant une pensée criminelle, elle porte atteinte à notre honneur. Mais je n'insiste pas et je m'excuserais même de vous avoir exprimé autre chose que ma gratitude, si je ne tenais à dire qu'en faisant appel à votre sympathie, nous avons la conscience d'en être restés dignes.

Les souscriptions pour l'œuvre du front peuvent être envoyées directement à la comtesse Joachim Murat, 41 rue St. Dominique, Paris, ou à l'ambassade de France à Washington. FRANCIS CHARMES,
Directeur, *Revue des Deux Mondes.*

Paris, Décembre 4.

[The article on the admirable work of Countess Murat which is referred to by M. Charmes has not actually appeared in the *Nation*, M. Charmes having formed his impression from a conversation with one of our Paris correspondents who had in mind the possibility of such an article at some future date. We are glad, however, to commend this especial sort of relief work, which consists of sending blankets and warm clothing directly to the front for the benefit of wounded soldiers who, otherwise, would be exposed while being conveyed to field hospitals and trains.—ED. THE NATION.]

A SERIOUS TYPOGRAPHICAL ERROR.

TO THE EDITOR OF THE NATION:

SIR: The American Association for International Conciliation has issued as No. 83 of its bulletins the "Official Documents Bearing Upon the European War." In it the German White Book still appears, I am sorry to say, in the defective translation originally published by the New York *Times*, which in many places is entirely inadequate.

In one instance, however, an evident attempt of the new publication at correcting an omission of the old one has made bad matters worse and led to a situation that might easily cause serious misunderstanding. The communication of the Imperial Chancellor to the Confederated Governments of Germany which appears on p. 113 of the bulletin is there dated July 23, 1914, whereas in the original publication of the *Times* it was left undated. There are accessible to me at the time of this writing three issues of the German White Book that have been published in Germany—the original document, as presented to the German Diet on August 4; a subsequent publication through the regular book trade, brought out by the Nordische Verlagsanstalt; and an English translation, vastly superior to the one of the New York *Times*, which was issued in Berlin by the publishing house of Liebheit & Thiesen. In every one of them the document in question is plainly dated "Berlin, July 28, 1914."

Annoying as this error is, it would hardly justify a notice in the columns of the *Nation* under ordinary circumstances. There is evident danger, however, that it lends color to a recent analysis of the English and German White Papers that has been widely read and is accepted by many as trustworthy in its findings. I refer to an article by the former Assistant Attorney-General, James M. Beck, which appeared in the New York *Times* of October 25, prominently featured as "The Case of the Double Alliance versus the Triple Entente in the Supreme Court of Civilization." It is a strictly partisan review of the official documents thus far published, in which the advocate of the one side attempts to play the part of judge and jury, with the result inevitable in such a case. But even as an advocate Mr. Beck has laid himself open to serious criticism, and one of his untenable contentions concerns the date of the document here referred to. Mr. Beck makes much of the fact that of all the documents printed in the German White Book just this one appears undated. From certain indications he infers that one should assume it to have been prepared on either the 23d or 24th of July. To be sure, it makes mention of events that did not happen until the 25th, but that renders it only the more suspicious to Mr. Beck. At any rate, to his mind, this double-tongued document is plain proof that Germany was plotting war when Servia had not yet even made answer to the Austrian demands. This is the ominous significance of the suppressed date. On it hinges in large part an invidious charge against the German Government. As a matter of fact, Mr. Beck did not even take the trouble of consulting the official publication of the accused Government in its original form. A mere glance would have convinced him that the date in question has not been withheld, and that it is as late as July 28, that is, three days after the arrival of the Servian reply in Vienna, and hence at a time when the European horizon had indeed assumed for Germany a most threatening aspect. Had Mr. Beck taken this trouble, he could easily have avoided the uncomfortable position in which he now finds himself of basing a most serious accusation on a typographical error in the translation of the New York *Times*.

This is the reason why I feel justified in calling attention to the erroneous date in the International Conciliation bulletin. It is a deplorable coincidence. If left unexplained, it might induce even thoughtful students of the questions involved to give credence to the charges of Mr. Beck against the trustworthiness of the data presented in the German White Book. A. R. HOHLFELD.

Madison, Wis., November 8.

NEUTRALITY AS AN OPPORTUNITY.

TO THE EDITOR OF THE NATION:

SIR: Is it too late to rescue public opinion in the United States from the wave of partisanship which is threatening to submerge it? Is it not evident that the acrimonious speech and militant suggestions which are now so conspicuous may, if unchecked, forfeit for this country its opportunity to be the instrument of a magnanimous peace?

All reasonable observers must indignantly protest against the horrors of war—the devastation of towns, the brutality of troops, the invasion of neutral territory; but to discriminate absolutely between the contending forces as between those of civilization and barbarism, or to fix complete culpability on one nation or on one man, is to simplify the case beyond recognition. The origins of the tragedy lie much deeper than any immediate provocation. It is not so much an insanity which has seized on one nation as a Nemesis which has overtaken

all. All alike have been for a half century involved in negotiations so tortuous, and preparations so incriminating, that they could have no other issue than this apparently uninterpretable war. The determination of Germany to dominate the land was matched by the determination of Great Britain to dominate the sea. The increasing German budget was an answer to the increasing term of service in France. Peace between Russia and Austria has long hung on the slender thread of a Balkan adjustment. In short, the universally accepted policy of a Balance of Power has involved an equilibrium so unstable that the most dexterous manipulations of diplomacy could not long postpone a crash. Not one of the nations concerned believes itself an aggressor. The overwhelming pathos of the letters which one receives from Europe is in the insistence by Germans, Frenchmen, and Englishmen alike that war was forced upon them and that they are fighting for national existence. The calamity, in other words, was inevitable. The secret barterings of diplomatists and the maintenance of peace by gigantic preparations for war have reached their only possible end.

In this state of European chaos the opportunity of this country is plain. Relief of distress we may freely and lavishly provide. Military coöperation is neither practicable nor desired. The English press has repeatedly pointed out that Great Britain does not need our ships and that we have no army. Reckless invective at such a time is mere vocal exercise. One way of service, and one only, is for the present open to us if we really want to help. We can keep our heads above the wave of passion; we can refrain from a credulity which believes the impossible; we can refuse all entanglements and alliances and maintain our fortunate tradition of diplomatic publicity and candor; and by these measures of self-restraint we can be ready, when the time arrives—God grant it may be soon!—to offer a judicial and unprejudiced tribunal for the great adjudication which must come. The appeal of President Wilson for a strict observance of neutrality is not merely for the sake of national self-interest, but quite as much for the sake of international usefulness. To hold our tongues just now, when the facts reach us with such distortion and exaggeration, may be to hold in our hands before long the fate of the world.

In a letter of Jefferson, written to Monroe in 1823, he says: "I have ever deemed it fundamental for the United States never to take active part in the quarrels of Europe. Their political interests are entirely distinct from ours. Their mutual jealousies, their balance of power, their complicated alliances, their forms and principles of government, are all foreign to us. They are nations of eternal war. All their energies are expended in the destruction of the labor, property, and lives of their people. On our part, never had a people so favorable a chance of trying the opposite system, of peace and fraternity with mankind, and the direction of all our means and faculties to the purposes of improvement instead of destruction." That which was in Jefferson political sagacity has now become moral obligation. Never had a people, in his words, "so favorable a chance of trying a system of peace and fraternity with mankind"; but never was a people more tempted to throw that chance away.

FRENCH BOMBS.

To the Editor of The Nation:

Sir: In the *Nation* (November 12, p. 573) I read a statement to the effect that French aviators bombarded some Rhine cities and dropped missiles upon Nürnberg. Allow me to state emphatically that there is not a word of truth in that report, which was "made in Germany" and used by Herr von Schoen as a pretext for the futile and wicked declaration of war on France on August 3. The French Government immediately denied the German Ambassador's assertion and, in an official document, bestowed upon it the qualification it deserves: "une misérable invention."

Paris, November 26.

GEN. SCOTT AS CHIEF OF STAFF.

To the Editor of The Nation:

Sir: It is an interesting coincidence that Gen. Hugh Lenox Scott, who has just succeeded Gen. Wotherspoon as Chief of Staff of the United States army, was his successor also, a generation ago, in a detail which brought both of them into country-wide notice. They were subalterns then, and ambitious for billets of the kind that push young men ahead in the military world; but their superiors preferred to set them at the seemingly thankless task of taking care of a band of Indian captives. Geronimo and his Apache following had surrendered after leading the troops a tedious chase through a pathless mountain wildness in the Southwest, and the Government sent them first to Florida and later to Alabama, where they were confined for a considerable period at Mount Vernon barracks, in the custody of Lieutenant Wotherspoon. The latter was glad enough when Lieutenant Scott arrived with orders to relieve him of his burden. Scott found the prisoners pretty thoroughly discouraged as a result of their sojourn in a climate to which they were entirely unaccustomed, and which was threatening to weaken their bodies as it had already wilted their spirits. Old Chihuahua voiced their common discontent in characteristic aboriginal fashion. "We do not wish to live here," said he. "We are shut up in a little place like this"—making signs with his hands to indicate a small rectangle, the shape of the tract on which the barracks were planted. "All around us is nothing but sand," turning his palms down and swinging them slowly around to direct attention to the soil. "The trees"—waving one hand about him to indicate the pine forest—"are so close together that you cannot look away at anything, and so thick"—pointing upward—"that you cannot see the sun. And when you sit down to rest," sighing wearily, "something bites you!"

Under Scott's superintendence they were soon moved to Fort Sill, in the old Indian Territory, where he devoted himself for several years to not only their care, but their instruction in the arts of peace. He taught them how to build the simple cottages in which they were to live, how to farm and garden, how to bale and sell their hay and peddle their vegetables among the housekeepers at the fort, and how to sink and curb good wells. As a precaution, he early took pains to prove to them the instantaneous operation of the telegraph in conveying messages hundreds of miles, incidentally suggesting the folly of any one's attempting to run away when it would be so easy to intercept a fugitive by a warning flashed to the authorities all over the surrounding country; and the effectiveness of this hint was shown by the fact that, although they were allowed now and then to go in parties to some distant point to gather a kind of wild beans of which they were fond, they never abused the privilege.

Far from shelving him professionally, this Fort Sill episode made Scott most favorably known throughout the country, and doubtless played no insignificant part in advancing his subsequent career. He will have scant time, of course, for outside activities while holding his present important post; but, after he has finished his term and retired, it is hoped that he will make some very valuable contributions to the store of American anthropological literature. While he was superintendent of the Military Academy at West Point, he used to advise every cadet to select some subject of research in which to interest himself by way of mental recreation, so that, when the time came to lay off the harness of war, life would not lose its charm or come to a full stop. The practical character of this counsel we shall presently see illustrated, without doubt, in the case of its author.

Francis E. Leupp.

Washington, D. C., December 8.

A REQUEST FOR LETTERS.

To the Editor of The Nation:

Sir: I am preparing what I hope to make an exhaustive treatment of Joseph Ritson's life and work. If any of your readers have knowledge of unpublished letters to or from Ritson, or of any Ritson manuscript whatever, I should esteem it a great favor if they would communicate with me.

Henry A. Burd.

SUGGESTIBLE DISEASES.

To the Editor of The Nation:

Sir: Our neighborhood is divided in opinion. Some of us, who have never looked up and just glimpsed Oregon or California vanishing into glimmering blue distance on the railway track of Progress, consider ourselves Progressive, and feel a great pride in belonging to a community that adopts and puts into practice every new suggestion. Others, of a lesser faith, phrase it differently, and say that we catch every new disease that comes along, and are ruining our health by taking too many remedies. One of these skeptics complains to me, regretfully and indignantly, that life is only a series of little eruptions, and that we spend so much of our energy in starting little things that we have none left for the doing of anything big.

I have come to be of the latter opinion. Our little community, to all outward appearance enjoying fairly good health, is really susceptible in the extreme to communicable diseases. Perhaps it would be more accurate to call them suggestible diseases. When anything becomes epidemic, we are sure to take it, whether we need it or not; but, even if the thing is not epidemic, we are likely to take it if we think of it or hear it mentioned.

Our thoroughfares are wide and free, every one has a lawn, there are abundant vacant lots and parks, we have a couple of miles of lake shore, and the country is only a few paces distant; but we have had the playground disease, and are still employing salaried experts to drive our children to diversion. We caught this from the nearest big city, where the children were really in need. Our richest men enjoy incomes of only a few thousand a year, and earn them, but we have not escaped the abuse-the-rich disease. That, too, we caught from a big city, where there were a few rich scoundrels and a few rich idiots, and a greater number of men of real conscience who could not keep the means of their enrichment from working occasional harm. Our poorest people have always felt able to fail their engagements and to refuse jobs that interefere with movie hours, and most of them have expensive habits and victrolas, but we nevertheless had a run of the pity-God's-patient-poor disease, which spread to us, presumably, from some big centre of either exceeding humility or exceeding tyranny.

We are a fairly religious community, but we had to succumb to a sharp, though harmless, attack of the recent go-to-church-next-Sunday indigestion that swept the country. We are still undergoing tango and snappy-music-in-church infections, with hopes that they will not become chronic. We are a college town, with professors from near and far lecturing gratis to empty seats, and with a half-dozen or more "brainy" pastors preaching and teaching Sundays and week days, but we are suffering acutely from the bring-knowledge-to-the-people inflammation, and are bordering on melancholia from the failure to get the man-in-the-street's consent to be enlightened. No one is more social than we are; we can scarcely get an evening at home; yet we have had the social-centre carbuncle. Of course, we have the intermittent educational-fad fever, accompanied by vocational pustules, and, of course, we have had the white-slave rash. Just now we are suffering from a very irritating attack of investigational itch. We have had Tag-days and Rag-days, and Mothers' Days and Fathers' Days, and Clean-up Days. We have had the Boy Scout movement and the Big Sister movement. We have had all the movements, and have all had the movements. The standard road to distinction and a quiet conscience in our little town has been the inauguration or the patronage of a movement of some kind. We should be universally distinguished and universally beatified, and our town a Saints' Rest in Glory, if it only were not that our movements are not lasting. They are rapid movements, and as they reach nowhere, they are naturally soon over. This is no way either to distinction or to eternal repose.

What ails us? We need not to be that way. It must be the nerves, as people say when there is nothing else to say. No one has ever really been able to produce evidence of any serious organic trouble in our community. Our affairs are not large, our citizens are fairly decent and industrious, and our officials fairly expert and conscientious. Up to a few years ago, we supposed we were enjoying pretty good health.

The probabilities are that we should have gone on indefinitely in our good health and happiness if we had not lost our ignorant and comfortable state of mind. We were simply in the case of the really healthy person who hears and reads a great deal about symptoms and remedies, and soon begins to magnify the slight ills to which his own and all flesh is heir, and fancies he needs medicine. We were really not ailing to speak of. We were not even nervous and run down, but we were told again and again of bad cases and wonderful cures, and began to feel the symptoms we had heard so much about. The first thing we knew, we were trying patent medicines—some at the recommendation of well-meaning local quacks who had acquired a taste for sociologizing, and some at the recommendation of itinerant sociologizing quacks who were not so unprofessional and not so innocent. We tried one patent medicine, and the momentary exhilaration of its more or less generous percentage of stimulant in the form of prospective results, aided no little by the judiciously mixed-in bitterness of unpleasant personal effort, made us feel better. Then both stimulant and bitterness began to lose force, through custom, and, of course, we tried another kind. We tried several. We tried all we could find. The promise of salvation shone forth from every patent-medicine bottle in the sociologizer's carpet-bag. We got the habit, and now we are depleted. We have lost the power of resistance. We listen now to every quack. The only bad citizen now is the one who will not consent to the opening of new bottles. We are medicine-mad, and becoming diseased in earnest.

We needed no medicine in the first place. Even when we began to think we were ill there was really nothing the matter more than is natural to any healthy person. Christian Science would have found us a perfectly easy case. Even now, many of us think that the most that we and other innocent towns of our size need is an old-line practitioner with a case of the standard drugs that have served for centuries. The name of the old-line practitioner is Common Sense.

GRANT SHOWERMAN.

Madison, Wis., November 28.

MISS AGNES IRWIN.

TO THE EDITOR OF THE NATION:

SIR: The death of Miss Agnes Irwin on December 5 in Philadelphia, in her seventy-third year, has removed from her large circle of friends a noted and beloved personality. A great-great-granddaughter of Benjamin Franklin, she inherited her full share of his wit and wisdom, joining to these her womanly traits, the sincerity and integrity of her strong character, and, above all, the attributes of a most loyal and loving heart.

The granddaughter of George Dallas, Vice-President under President Polk and Minister to England, a great-niece of Col. Dallas Bache, the distinguished Superintendent of the United States Coast Survey, with the men of her large family connection holding important positions in the United States Government and in the army and navy, she had, from her youth up, an unusually wide social experience, a certain breadth of view as well, confirmed by her residence in Washington, New York, and Philadelphia.

In her early life it became necessary for her to join the Honorable Order of Self-Supporting Women. She opened a school for girls in Philadelphia, and, ably assisted by her sister, Miss Sophia Dallas Irwin, she conducted it so successfully that to-day the school stands in the foremost ranks, and is filled to overflowing with pupils, many of them the grandchildren of the original pupils. For thirty years she performed the arduous exacting duties of principal of a large school, giving the young lives committed to her care an uplifting and ennobling influence, her friendship following them into their maturer years.

Miss Irwin was a cultivated woman in the highest sense. She had a remarkable memory; her reading was extensive and varied; her mind was stored with the best in classic and modern literature. Her frequent visits to England and Europe gave her an appreciative knowledge of art and architecture. She was a delightful companion, and was sought and prized in every society. She was endowed with health, vigor, and a noble presence. Her wit was proverbial; but her enjoyment of another's wit was equally apparent. It was well said of her that she had an extraordinary power of self-effacement; that she listened quite as well as she talked; that her opinions had to be sought. By nature she was conservative, but she was most open-minded, and ready to listen to views that were opposed to her own. She was a devout member of the Episcopal Church, and will be missed in its communion.

In 1904, when Radcliffe, the woman's college of Harvard University, was incorporated, Miss Irwin was invited, from among the many distinguished women then engaged in educational work in the United States, to accept the position of the executive officer of the college. At that date the faculty of Harvard looked askance at the inauguration of a woman's college at Cambridge, and it required Miss Irwin's able management, her good sense and tact, to steer the course of the College through those opening years, and to win for Radcliffe the confidence and support of the University.

She served as dean of Radcliffe for fifteen years, receiving during that period the honorary degree of LL.D. from the University of Pennsylvania, and a degree from the University of St. Andrew's in Scotland. Before resigning, in 1909, she raised, with Mr. Carnegie's help, a fund for the endowment of the Radcliffe College Library.

For the past three years she has been president of the Head Mistresses' Association of Private Schools, representing some fifty schools for girls in this country. "No one knows the help and inspiration she has been to us teachers," said one of the members recently.

Deeply affected by the present European war, her mind dwelt upon the suffering Belgians, and how best to help them. "Imagine," she said, "what it would be, suddenly and for no fault of one's own, to find one's self homeless and destitute." Within the past month she joined a committee in Philadelphia, assisting Madame Vandervelde in raising a large sum of money for the Belgians.

How far and how intimately Miss Irwin's personal influence has been felt cannot be estimated. Of those with whom she came in contact, whom has she not helped, succored, divined? Who can measure the depth of her sympathy, the loyalty of her friendship, the wisdom of her counsels? Hers was a great personality, and her modesty an essential part of it.

BOOKS ON CALIFORNIA.

The Tourist's California. By Ruth Kedzie Wood. New York: Dodd, Mead & Co. $1.25 net.

California, Romantic and Beautiful. By George Wharton James. Boston: The Page Co. $3.50 net.

California, the Land of the Sun. By Sutton Palmer and Mary Austin. New York: The Macmillan Co. $4.

California, Romantic and Resourceful. By John F. Davis. San Francisco: A. M. Robertson. $1.25.

Spanish and Indian Place Names of California. By Nellie van de Grift Sanchez. San Francisco: A. M. Robertson. $2 net.

With the Flowers and Trees in California. By Charles Francis Saunders. New York: McBride, Nast & Co. $2.50 net.

California: An Intimate History. By Gertrude Atherton. New York: Harper & Bros. $2 net.

California is certainly the luckiest and most resourceful country in the world. Gold, grain, fruit, wine, petroleum, and tourists have successively and continuously enriched it, and the future is even brighter than the past. The tourist industry, in particular, is sure to grow apace enormously. The Panama Exposition in San Francisco will stimulate it greatly, and it is likely that, while the nations at war will not be able to participate very actively, this loss will be compensated for by the consideration that the great stream of tourists, finding Europe closed, will turn to the West to see their own country. This situation explains the flood of books just now being added to the big library on California previously published. The subject is inexhaustible; each one of the seven volumes under consideration to-day presents new points of view and is worth reading.

Apart from Baedeker, there is no book which gives so much useful information on California for travellers as the first one on our list. It describes the various routes to that region, as well as the routes from place to place within the State, with the cost by rail, boat, or stage, and estimates of hotel expenses, etc. "Considering its longitudinal extent, California is kinder to the automobilist than any State in the Union." It will soon be possible to motor from the Mexican to the Canadian border and thence from the Pacific to the Atlantic. The time of the year, so far as California is concerned, makes no great difference. There are nearly as many climates as there are counties, and of counties there are fifty-eight, so the tourist can have what he likes. The principal towns and regions most favored by tourists are adequately described in this guide, and there is much incidental information about marvellous fruits, seven-pound radishes, and that sort of thing. San Francisco, made over new, has eight hundred restaurants, the local flavors of some of which are discussed. Bret Harte's country is not overlooked, nor does the author forget to describe the grounds of the Panama Exposition.

It is not merely as a lure that so many books about California have the word Romantic in their title. There is romance a-plenty in the past of the State, and romance in many of its aspects to-day, allied with rare beauty and variety. This romance and beauty form the special subject of Mr. James's volume, the abundant and excellent illustrations in which (some in color), combined with the persuasive text, make it a potent tract for the region and an entertaining one. The book is the fifth in the See America First series published by the Page Company (the others being "Old Panama and Castillo Del Oro," "Three Wonderlands of the American West," "Houseboating on a Colonial Waterway," "Panama and the Canal To-day"), and its author is already favorably known for half-a-dozen other books on the Southwest. Where his own extensive experience does not seem to him sufficient, he quotes from famous writers, including some interesting accounts of mountain ascents by Muir and others. He also cites a good deal of poetry, all of it by Californians inspired by their surroundings. The reader is taken along the coast, to the cities, up and down mountain trails, through the deserts, the valleys, the orchards—wherever there is romance or beauty—generally both. Among the pictures there are photographs of fruits and fish which prove that not all "California stories" of bigness are exaggerations. Mr. James does his best to persuade his readers that there should be many more to enjoy the romance and beauty of California, not only as tourists, but permanently, as settlers. He calls attention to the fact that the British Isles, with an area smaller than California, support over eighteen times its population.

Another most abundantly and superbly illustrated book on the same State is the joint production of Sutton Palmer and Mary Austin. How any one can look at these pictures—thirty-two of them, all colored—pictures of the Yosemite, Lake Tahoe, Tamalpais, eucalyptus groves, Santa Barbara Mission, Santa Cruz Mountains, Shasta, Castle Crag, and so on, some of them, like that of Redlands, showing the contrast of flowers and ripe oranges below with snow on near-by ranges, which is so delightfully characteristic of Southern California—without wanting to rush to the nearest railway ticket office, is beyond comprehension. Sutton Palmer is responsible for these pictures, which are more beautiful and illuminating than photographs, while the text, by Mary Austin, is divided into nine chapters, the titles of which convey a suggestion of their content and spirit: The Sparrow Hawk's Own, Mothering Mountain, The Coasts of Adventure, The Port of Monterey, Old Spanish Gardens, The Land of the Little Duck, The Twin Valleys, The High Sierras, and The Sage Brush Country.

No book on California does the subject justice unless it has a chapter on its trees and flowers, and most of them have one. Charles Francis Saunders devotes a whole book to them. It is not a scientific treatise, nor does it attempt to cover the subject systematically. What the author does is to chat about the plants—learnedly sometimes, for he has delved in old Spanish records—but always entertainingly. Here the tourist who is looking forward to a trip will find more miscellaneous facts than elsewhere about the trees, shrubs, and flowering plants that daze and delight every one. Many of them are immigrants, for the Californians delight in importing exotic wayside trees and plants from all parts of the world, as if their own State were not one of the richest of them all. Mr. Saunders has reason to chide the Californians themselves for not knowing—though they are so much given to boasting—what an important part their country has played in beautifying the gardens of Europe. Not only are they full of California wild flowers, but "before California was discovered gardens were almost deficient in one of their present-day strong points—that is, annuals." Abundant pictures further enhance the charm and value of this book, on which it would be a pleasure to dwell longer if space permitted.

Most tourists are glad to know something about the romance and the historic incidents suggested by the place-names of California, so many of which are Spanish or Indian. Why are the big trees called sequoias? Why was the second city of the State—some now claim for it first place—called Los Angeles? Whence came the name California? These and hundreds of similar questions are answered by Nellie van de Grift Sanchez, alphabetically and correctly, wherever accurate information was obtainable through patient research, supplemented by information from John Muir and several experts in the universities of the State. Very often the missionaries chose the names still in use; yet "in many cases the choice of the soldiers has outlived that of the fathers." Unlike other books of reference, this one can be read through with pleasure from beginning to end. Under La Brea interesting information is given concerning the asphaltum beds near Los Angeles, which constituted a "death-trap" in the Tertiary Age, and from which nearly a million specimens of animals, including camels and elephants, have been taken.

"California, Romantic and Beautiful," by John E. Davis, is a misnomer. It is not a treatise on the romance or the resources of the State at all, but simply a plea of sixty pages for the collection, preservation, and diffusion of information relating to Pacific Coast history, followed by the Love Story of Concha Argüello, and a poem by Bret Harte. Mr. Davis calls attention to the extraordinary luck of the great Bancroft library of invaluable manuscripts and books in thrice escaping by the narrowest margin destruction by fire. Yet, notwithstanding this collection, and a travelling fellow-

ship for further research recently established, the author thinks that still more should be done before it is too late, and he calls for subscriptions to further this end.

The history of California is, like the State itself, so romantic that it requires no novelist to make it readable. It is needless to say that, nevertheless, Gertrude Atherton's "intimate history" is more entertaining than most other volumes on its subject, although she does not romance in the least, but sticks to the facts established by other historians. No original research will be found here, but there is the sure touch resulting from being a native of the State and knowing it thoroughly in all its aspects. There is much that appeals to the imagination. San Francisco, the most interesting city in the Union, is most vividly portrayed; there is a graphic chapter on gold and the incredible barbarisms of mining life; and the very names of some of the other chapters suggest the brilliant use the author has made of them: The War, The Terrible Seventies, The Chinese Must Go, Last Phases. One of these last phases is woman suffrage, which, as she notes, was won with the country vote by "the women who had taken motors and visited practically every farmer and hamlet in the State."

CURRENT FICTION.

The Demi-Gods. By James Stephens. New York: The Macmillan Co.

Patsy MacCann was a travelling tinker, a tramp, and a thief; and after this concession to the dictates of truth and candor, it may be added, without offence, that he was a critic—as it might be, a book reviewer. In this capacity he observes: "A good story has to be about ordinary things, but there isn't anybody who could tell what your story was about." If the present tale is not a good one, judged by Patsy's canon, it possesses, none the less, many of the characteristics that made the charm of "The Crock of Gold." It relates the wanderings of MacCann and his daughter Mary, with three angels for steady company, and the occasional companionship of Eileen Ni Cooley, an undesirable, Billy the Music, and a sort of visiting angel, Cuchulain, in somewhat patronizing attendance upon Brien O'Brien. Brien dies twice in these pages, spending the interval in mischief of various kinds and the pursuit of his lost three-penny piece. It might be supposed that Patsy and the angels would make an oddly assorted party. But no. "The angels were strangely like Patsy MacCann. Their ideas of right and wrong almost entirely coincided with his. They had no property, and so they had no prejudices." Indeed, the proposition that immediately follows seems fairly to afford common standing ground for angels and larcenous tinkers:

Civilization, having built itself at hazard upon the Rights of Property, has sought on many occasions to unbuild itself again in sheer desperation of any advance, but from the great Ethic of Possession there never has been any escape, and there never will be, until the solidarity of man has been really created, and until each man ceases to see the wolf in his neighbor.

So Archangel, Seraph, and Cherub walk the pleasant Irish countryside for a space, ever and anon elucidating the mysteries of Cosmos by means of stories—a method as old as the world. And the patient ass, friend and servant of the company, listens appreciatively, and even, in the end, delivers itself of five little stories—though how and to whom does not appear. At last the time comes for the angels to "go away"; and Finaun, the archangel, and Caeltia, the seraph, resume their shining garments and depart. But not so Art, the cherub, who, remembering Mary MacCann, rends his beautiful raiment and remains. And so we emerge from the atmosphere of mysticism and rub our eyes as we watch Art and his love pacing down the narrow track, his great arm laid about her shoulder.

Picrre Vinton. By Edward C. Venable. New York: Charles Scribner's Sons.

Happy are the story-tellers who can adjust themselves to changed conditions. Is romance dead, just because stalwart youth and tender maiden no longer mate in the old blushing Victorian fashion and live happy ever after—even supposing that they don't? Not a bit of it. Shall the field of romance be narrowed because divorces multiply and Reno flourishes? Never. Rather out of the legal separation of two loving hearts will we build up romance anew, and where before was but one wedding, through the beneficent institution of divorce we will make two to grow. This is what Mr. Venable does in "Pierre Vinton: The Adventures of a Superfluous Husband," and it must be said that he does it uncommonly well. How Pierre allowed himself to be divorced, not wanting to in the least, but feeling that it was only the gentlemanly thing to do, as his charming young wife, to whom he had never refused anything, appeared to desire it, is exceedingly well told. The subsequent wooing of the pair, who would never have been sundered if they had duly observed the exhortations of the gentleman who married them, may almost be described as an idyll of divorce. The compromising situation in which they find themselves at the end, and which calls from a mutual friend the warning telegram, "Pour l'amour de Mike, soyez raisonnable," is quite delightful. Mr. Venable has a light touch, and his pages are illuminated with flashes of quiet humor.

Arcadian Adventures with the Idle Rich. By Stephen Leacock. New York: John Lane Co.

In the present volume, not the least of Mr. Leacock's happy fancies is his selection of a title which exactly expresses his theme. Each of the eight sketches included in the volume is complete in itself, but they are loosely connected by the locality of "Plutoria Avenue," and the recurrence in them of various personages who inhabit that thoroughfare. Some of these characters are deliciously conceived, with just the touch of exaggeration that is required for satire, but without the distortion that turns the picture into caricature. Dr. Boomer, for instance, the president of the university, is a familiar type, remote as the poles from the cloistered calm that one associates historically with the academic life, a hustling, business-like personage, ever ready with an oration, and keeping a weather-eye always open for benefactions from the wealthy. There is not a little verity in this description of the president's tactics: "Indeed, it was part of Dr. Boomer's method to get himself endowed first with premises too big for the apparatus, and then by appealing to public spirit to call for enough apparatus to more than fill the premises, by means of which system industrial science at Plutoria University advanced with increasing and gigantic strides." Not less to the point is the exposition of certain modern ideals of the function of a university: "It [the university] offered such a vast variety of themes, topics, and subjects to the students, that there was nothing that a student was compelled to learn, while from its own presses in its own press-building it sent out a shower of bulletins and monographs like driven snow from a rotary plough." And this, as a sly dig at "vocational training," is quite delicious: "A foreign visitor once said that the students looked like plumbers, and President Boomer was so proud of it that he put the phrase in his next commencement address; and from there the newspapers got it, and the Associated Press took it up and sent it all over the United States with the heading, 'Have Appearance of Plumbers; Plutoria University Congratulated on Character of Students,' and it was a proud day indeed for the heads of the industrial science faculty."

Yourself and the Neighbors. By Seumas MacManus. New York: The Devin-Adair Co.

Only an Irishman could have written this book, and perhaps only an Irishman can fully appreciate it. But there is pleasure in it for any lover of simple and unspoiled human nature. It is a series of sketches, lovingly and minutely detailed, of peasant life in Donegal. The style is that of intimate reminiscence, sometimes a trifle too garrulous, at least for the reader who has not the right store of memories to draw upon. Nearly all the narrative is in the second person; and this too becomes tiresome if "yourself" is in the least bit of a hurry. But if you are content to read leisurely, you can follow with much quiet enjoyment "Yourself and Herself" through school-days, courting days, and married life to contented old age. You will meet great people like Barney, the "Priest's Boy," who, at the age of sixty-six, rules both parish and priest with a rod of iron, and finds his match only in the postmistress; and the tyrannical Bacach (beggar), who is the newspaper of the countryside and commands the best of food and lodging that every house can afford; and the Come-Home Yankee with his marvellous tales of Coney Island or Jee-cago. You will get acquainted

with the tinkers, and the Bachelors of Bragg, and the Masther, and Father Dan. You will spend the day cutting turf in the bog, and will listen in the evening to stories of the Gentle People, and Phelimy Og, and Denis a-Cuinn, and the Grey Man. Altogether it will be your own fault entirely if you do not enjoy yourself. An idea of the style may be obtained from this anecdote of the first day at school:

Your hardihood had to stand its final test in the Square Park after school was loosed. There, while the other pairs of knights waited their turn, you planted your black bare foot opposite Micky Tummoney's very black bare foot, and the two of you glared at each other—all the more fearfully because neither of you knew what he was glaring about. As both of you were dilatory about leading unprovoked hostilities, any one of a dozen obliging friends *(agents provocatcurs)*, always prompt to further a good cause, extended a horizontal arm between you, saying, "Who dar' spit over that?" when both of you, instantaneously and simultaneously daring, gave and got glorious cause for battle.

ISLAM IN EARLY DOCUMENTS.

The Early Development of Mohammedanism. By D. S. Margoliouth. The Hibbert Lectures, May and June, 1913. New York: Charles Scribner's Sons. $2 net.

After having made a careful study of the life of Mohammed and prepared a sketch of his religious system, Dr. Margoliouth has begun to investigate "the supplementing of the Koran." The material used is in the main recently printed works of Moslem authors of the third century of the Hegira. An advance guard of present-day Mohammedans has evidently arrived at the point of desiring easy access to their ancient documents, though scarcely any of them are as yet capable of scientific criticism. Accordingly they publish texts which a few Westerners, like Drs. Goldziher, Snouck Hurgronje, Macdonald, and Margoliouth, are examining with similar intent to that of the many great scholars who have sought to comprehend the origin and growth of Christianity by the interpretation of its early literature.

The title of the present book is considerably more ambitious than its contents justify. The author believes, perhaps erroneously, that "Islam was far more a political than a religious system," but he makes no attempt to follow out the direct line of its political development. Nor does he trace other elements which were equally a part of the singularly unified Mohammedan scheme of life, such as the constitutional, the military, the commercial, the educational, and the literary aspects. Moreover, within his chosen topics, which are the Koran, the Sacred Law, the tolerated communities, and the ethical, ascetic, philosophical, and historical supplements to the Koran, he does not attempt a complete survey, but presents the point of view of a limited number of original authorities. But the material he provides is valuable, and much of it is fresh either in content or in point of view.

The Koran and not the Caliphs took the place of the deceased Prophet. For a century and a half it was deemed the only necessary Moslem writing. But a great mass of oral material, interpretative or supplementary, was accumulated rapidly. In time much of this was written down.

The author's general tendency is to minimize the introduction of ideas from outside during the period of oral tradition. Admitting that Mohammed was under some influence from Jews, Greeks, and Christians, he denies that these, or Romans, Hindus, and Persians, had much to do with the unfolding of Moslem thought and life. He is able even to find a sufficient basis for the Sufic development through asceticism to pantheism in Mohammed's insistence that "there is no God but Allah, with whom nothing can be associated." It is hard to agree with the view that the early Moslem progress was so unrelated. When an undeveloped people, supplied with a fresh combination of powerfully stimulating ideas, spreads itself thinly over an area occupied by great numbers of more advanced peoples, and later is found in possession of views that had existed long among the conquered peoples, it is easier to believe that these views were adopted than that they were rapidly and independently expanded out of the original ideas, however possible an expansion of this kind may be from a logical point of view. Had the writer brought within his ken a larger amount of Moslem material of the fourth and fifth centuries, he could hardly have rejected many evident derivations from Roman law and government, from Persian ceremony and mysticism, and from Greek philosophy and science. Nor is it likely that these influences became operative only as late as the tenth century of the Christian era. Close contact, of certain sorts, especially with Romans and Persians, was established within five years after the death of Mohammed, and relations were thenceforth steadily broadened and deepened with the growth of empire and the bringing in of countless converts.

Exception may also be taken to the assertion with which the author begins, to the effect that "Islam has to be preached with the sword, for without going into the water one cannot learn to swim, and there is no probationary dip." For though no unbeliever might in the early days lawfully purchase or touch a copy of the Koran, or enter a mosque, or witness a pilgrimage, there were always alternative ways of becoming acquainted with Moslem belief and practice. In fact, the writer himself admits the existence of several methods of non-forcible conversion (pp. 132, 133); among these, however, that of the persuasion of unbelievers by believers finds no place. Is Dr. Margoliouth unacquainted with J. W. Arnold's convincing book, "The Preaching of Islam"? In fact, the general criticism may be made that the writer has placed too exclusive reliance upon a few original authorities, and has not sufficiently enlarged his point of view by consulting carefully the works of modern predecessors and contemporaries.

Mohammedans and some Christian scholars will hardly be pleased with the assertion that the earliest life of the Prophet "places all the generosity, the heroism, and the public and private virtues on the side of Mohammed's enemies"; nor can they accept the sharp concluding contrast drawn between the historical and the fictitious Mohammed, of whom the one is made out to be a resourceful but unscrupulous politician, and the other "the legislator, the saint, and the thaumaturge."

Other interesting questions are raised by the writer, which reveal extensive possibilities of critical research into many phases of the vast Moslem civilization. The foundations of many familiar statements in regard to it are evidently far from secure.

AN OPPONENT OF FEDERAL GOVERNMENT.

Antigonos Gonatas. By William Woodthorpe Tarn. Oxford: The Clarendon Press. 14s. net.

This book deserves our attention on several grounds. It is the work, not of a professional scholar, but of a lawyer who has made Greek history his avocation; yet it is distinguished by the rigor of its method and the mastery it evinces of the sources and the scientific literature of the subject. Its central figure is less known even in professional circles than he ought to be. Antigonos Gonatas merits the penetrating and sympathetic interpretation he has now for the first time received for two reasons that the general reader can appreciate: he was the patron of Zeno, the founder of Stoicism, and he was the persistent adversary of the first experiment in federal government known to history. Naturally, Mr. Tarn has been alive to the outstanding aspects of his theme.

His first chapter, entitled The Teachers of Antigonos, puts Zeno into his historical *milieu;* his eighth, Antigonos and His Circle, introduces us happily to the group of poets, philosophers, and historians which the King's personal interest in their work attracted to his court: Persaios, Zeno's unworthy deputy; Aratos of Soli, whose famous poem, the much-translated, horribly dull "Phainomena," did not merely provide "dry bread for readers surfeited with literary sugarplums," but represents "the first halting attempt that the world has seen 'with patient plan To justify the ways of God to man'—to bring out the Stoic doctrine of Providence"; Hieronymos of Cardia, whose repute as an historian has risen steadily with the decline of the notion that history is merely a literary exercise; Bion, the wandering cynic from Borysthenes, half-mountebank, half-preacher, the coiner of phrases whose "downright vulgarity struck Plutarch no less forcibly than it does ourselves," the author of the winged words in regard to the dying frog, "The boys stone it in sport, but the frog dies in simple earnest"—a man of dual nature, an Odysseus in beggar's rags, thought the great con-

temporary scientist Eratosthenes. All of these men are considered in this chapter in the light of their personal friendship with Antigonos.

In regard to the Ætolian League, Mr. Tarn nowhere takes a very definite position; he simply describes its growth, and inadequately explains its nature. Of its Achæan rival he has more to say. His attitude to it and to Greek federalism in general is frankly hostile. "The [Achæan] League in fact," he says, "was a bit of the Macedonian empire broken off and fitted with a new constitution. The reason of its existence as a part of that empire had been to act as a counterpoise to Sparta; and this remained its function." This is, we think, to minimize greatly the importance of the federal movement; it is to view it too exclusively from the Macedonian point of view of Antigonos Gonatas; and, taken as a whole, Mr. Tarn's book is nothing less than a consideration of half a century of eventful Greek history from the standpoint of Macedon's King. That federalism, despite its ultimate failure, was something more than a visionary project or a form of government devised for a bit of the Macedonian empire broken off, is shown by the fact that, notwithstanding Gonatas's refusal to make any compromises with it, his statesmanlike kinsman, Antigonos Doson, adopted it as the basis of his unification of Hellas, and even went so far as to make Macedon itself a federal league.

PUNISHMENT AND REFORM.

Those Who Have Come Back. By Peter Clark MacFarlane. Boston: Little, Brown & Co. $1.35 net.

The Man Behind the Bars. By Winifred Louise Taylor. New York: Charles Scribner's Sons. $1.50 net.

The science of criminology and the art of philanthropy have done much, in the course of a generation, towards checking the production of criminals, humanizing the state's treatment of them after conviction, and increasing their chances of reform. Of the theories and methods involved in this progress journalism has made much copy. Is heredity or environment the chief factor in the breeding of crime? Was Lombroso right about his "criminal type"? Are a considerable proportion of prisoners innocent, or at least more sinned against than sinning? Is the whole idea of punishment to be supplanted by an idea of reform and rescue?

The two books before us deal somewhat emotionally with the criminal and his relation to society. The fundamental conviction upon which they both are based is that the "man behind the bars" is a fellow-being and not a monster; that accident or circumstance, not innate depravity, is ordinarily responsible for his plight; and that even in his deepest guilt he is capable, under favorable conditions, of becoming a useful member of society instead of a burden upon it—of "coming back." Yet these books are radically different in source and in spirit. The author of "Those Who Have Come Back" has seen an opening in the case of the criminal for a series of good magazine "stories." He has caught the peculiar jaunty, snappy style which "gets across" with that immense grammar-schooled public to which the ten-cent magazine stands for literature. He has chosen a number of instances of persons far gone in vice and crime who have "come back" and "made good." No glamour is to be cast about these crooks *qua* crooks; but they are represented as victims rather than degenerates or defectives:

> As long as we have poverty in our midst desperate want will revolt in desperate deeds, and poverty we shall have until the race has reached a higher average of thrift and efficiency, and industrial conditions are developed on a basis of fairness to all; and where there is a weak link in the moral nature of a man undue pressure of temptation, brought to bear on that link, will cause it to break, even while in his heart the man may be hungering and thirsting for righteousness.

Miss Taylor's book is written from a different experience and a different motive. She addresses an audience, not a market. She also believes that "the criminal problem is one of conditions quite as much as 'cases.' In our large cities, the reservoirs of crime, we are but reaping the harvest of centuries of evil in older civilizations, and in our own civilization as well." She also has instances to cite of criminals who have come back. "In my preconceived opinion, the most hopeless case I ever assisted surprised me by settling down, under favorable environment, into an honest, self-supporting citizen." But she has not "got up" her subject as an outsider may. For many years she has studied prisoners and made friends of them. She writes of them, she confesses, with a confidence which belongs to her nature, but it belongs also to her method of approaching them: "Doubtless the key to my own position is the fact that I have always studied these prisoners as men; and I tried not to obscure my vision by looking at them through their crimes." Her experience makes her indignant at our ruthless legal methods, especially in the cities: "Railroading men to prison is purely a matter of business; no consideration is given to the individual accused, he is no longer a human being, he is simply a 'case.'" She also dwells on the cruelties and crudities of prison discipline, the enforced speech of the "third degree," the more deadly enforced silence of the cells and the prison-yard. Of the more humane methods now coming into use, of the probation system, and so on, she speaks with hopefulness. But the movement has only begun, the great tradition is yet to be broken, and Miss Taylor puts her trust in no half-measures: "I have no wish to see our prisons abolished," she sums up, "but thousands of individuals and millions of dollars have been sacrificed to wrong methods of punishment; and if we aim to reform our criminals we must first reform our methods of dealing with them, from the police courts to the penitentiary."

ORIENTAL MYTHS.

Myths of the Hindus and Buddhists. By Sister Nivedita and Ananda Coomaraswamy. New York: Henry Holt & Co. $4.50 net.

The scope of this volume is ambitious—the material is collated with a view to satisfying a popular interest in two of the great religions of India; but was it wise to assume that a similarity of thought and fancy justifies their being presented as part of some one fabric? It is not to be expected that two exponents of Hinduism could do justice to Buddhism in so intimate a juxtaposition. The Hindu student is characteristically inclined to exploit Buddhism for the Western reader as one of the manifestations of his own intellectual life. Here, the Buddhist myths are arbitrarily injected into the middle of the Hindu story, with a sudden reversion to the latter, and without clear explanation to the reader—an illogical arrangement.

In issuing from Brahmanism, Buddhism carried with it a great stock of notions, mythological and cosmographical, as well as philosophical; but it had elements of original vitality—chiefly its founder's personality—which so sharply distinguished it that an assimilation of the new with the old is unthinkable from the Buddhist point of view. After all, an association may be justified when we come to folk-lore and legend, in which sphere the two religions hold more or less in common, for example, the Ramayana story. As the authors assert, a version of this epic is to be found in one of the Jātakas. It should be remembered that the Jātakas were put into their present shape as late as about the fifth century A. D. in Ceylon; but the collection existed in a more or less copious form as early as the time of Asoka (250 B. C.), while the materials embodied date from times immemorial. The Jātaka tale of the Six-tusked Elephant (p. 252) is a favorite in early plastic art. It can hardly be said (p. 245) that Buddha's father was *raja* of the Sakiyas: authentic Pali sources speak of a republic. What is meant by the statement (p. 248) that Buddha lived and died a Hindu? His sneering remarks about the "Brahmins versed in the Three Vedas" are inconsistent with any continued recognition of Vedic authority, which, presumably then as later, was the criterion of orthodoxy. The Hindu stories from the epics are well told and are a tribute to the enthusiasm with which Sister Nivedita entered into Hindu life and thought, in her endeavor to bring Western sympathy and understanding nearer the subject race.

Of the beautiful illustrations in the volume more than passing mention might be made. Briefly, the care and scholarship shown by the Indian illustrators are a favorable omen for the establishment of a school in the worthy traditions that obtained during the seventh and eighth centuries, the classic period of Indian art. Many of the scenes clustering about Plate xx are beautifully shown in the famous Gandhara sculptures.

Notes

Charles Scribner's Sons announce the publication of "With the Allies," by Richard Harding Davis.

Frederick A. Stokes Company will publish next month: "Before the Gringo Came," by Gertrude Atherton; "The Good Shepherd," by John Roland; "School Hygiene," by Leo Burgerstein.

The Century Company announces for publication this month "The Revolutionary Period in Europe: 1763-1815," by Henry E. Bourne.

G. P. Putnam's Sons announce the publication of: "Deutschland über Alles," by John Jay Chapman; "Fear and Conventionality," by Elsie Clews Parsons; "A History of Old Kinderhook," by Edward A. Collier.

Henry Holt & Company announce the forthcoming publication of: "Possession," by George Middleton; "How to Produce Plays for Children," by Constance D'Arcy Mackay; "Short Plays About Famous Authors," by Maude M. Frank.

The Poems of Edgar Allan Poe, in the collection edited by Edmund Clarence Stedman and George Edward Woodberry, are now brought out in a pleasing volume by Scribners ($2 net, illustrated).

Reissues this season of J. W. McSpadden's Synopses of Shakespeare's plays, Dickens's novels, and Scott's Waverley novels bespeak the demand in which this convenient little series is held (Crowell; 75 cents net, each).

Bulfinch's Mythology has, it seems, maintained its appeal into the present generation of readers. It is now issued (Crowell; $1.50 net) in a single serviceable volume, with good print, containing the Age of Fable, The Age of Chivalry, and Legends of Charlemagne. The book is furnished with thirty-two illustrations.

We have received from the West Publishing Co. of St. Paul, Minn., "Compiled Statutes of the United States, Embracing the Statutes of the United States, of a General and Permanent Nature, in Force December 31, 1913," compiled by John A. Mallory, assisted by members of the publishers' editorial staff. We need scarcely add that this work, which is in five stout volumes, is invaluable for reference.

The revolution brought about in the banking system of the United States by the passage of the Federal Reserve act in December, 1913, has, no doubt, been the occasion of a new fifth edition of Mr. Horace White's "Money and Banking" and of Prof. Joseph French Johnson's "Money and Currency." Both these well-known textbooks have been reissued by Ginn & Co. ($1.50; $1.75), with added chapters discussing the new legislation. Mr. White does not offer any detailed opinion as to the probable working of the act beyond saying that "the fact that the national banks have joined together with practical unanimity to put it in operation makes it highly probable that it will be a success" (p. 449). Professor Johnson is not quite so hopeful, and considers that "it is impossible to foretell the effects of the establishment of this new banking system" (p. 378). He points out that it contains features which were "the subject of severe criticism from many quarters" (p. 380), as, for example, its practical coercion of the national banks, compulsory rediscounts by one regional bank for another, the number of regional banks, the nature and conditions of issue of the new notes, and the adequacy of control provided. It is this last feature to which failure of the law, if it should occur will probably have to be charged. Professor Johnson definitely favors the "one central bank" idea as the scientific way of meeting the currency requirements of a country like the United States.

One turns to Mary Edith Durham's "The Fight for Scutari" (Longmans, Green; $4 net), prepared for disappointment. Nothing in international politics that is older than August, 1914, can have interest or value. And if it comes to fighting, what possible comparison is there between the desultory raids and snipings and petty starvations of the Albanian highlanders and the mighty European melodrama? One finds Miss Durham's book fascinating. Possibly because the gigantic battlefields and holocausts of the world war after all leave the imagination dulled, this picture of primitive border warfare grasps the reader by its very concreteness. And after all the petty turmoils of Albania in 1910-12 were the prelude to the great drama of 1914. Albania it was that gave the signal for the Balkan upheaval against the New Turk and hastened on the two wars which, by humbling the Turk and exalting the Serb, brought on the great conflict. Thus one gets the rare sensation of watching, in the interplay of petty chieftains and the wars of small tribes, a Punch and Judy show which, by a swift darkening and illumination of the theatre, revels as "Macbeth." Nor is it the least charm of the book that it is written by an observer who was a participant in a very rare sense. Miss Durham, by long acquaintance and sympathy, had made herself a power among the mountaineers of the Adriatic coastlands, taming the savage tribes whom Rome and the Ottomans had failed to subdue. To her come shaggy highland chiefs for advice and intercession, governors, prime ministers, princes of the blood, if only of Montenegrin blood. She reminds one of nothing so much as of the wise women whom the early Teutonic tribesmen honored and obeyed; except in the spirited partisanship with which she defends the cause of her favorite Albanians against their betrayers—Turk, Montenegrin, or Serb.

The merit of "Thistledown: A Book of Scotch Humor, Character, Folk-Lore, Story, and Anecdote" (Stokes; $1.75 net), by Robert Ford, resides in the countless and often delightful anecdotes that the author has gathered, rather than in his study of the nature of Scotch humor. The book is, indeed, little more than a collection of illustrations of Scotch humor roughly classified under such heads as Old Scotch Divines, Scotch Precentors, Dram-Drinking, Scottish Rural Life, Scotch Naturals. The author has shown more than ordinary skill in excluding pointless stories, and in including stories that, in addition to being amusing, afford an insight into Scotch character. The foreign air of the book is enhanced by colored drawings well executed by John Duncan, and by the author's curious style, which has a touch of old-fashioned pompousness, and contains more than one "manifest Scotticism." One anecdote will suffice to reward the reader of the present paragraph:

"Jock," cried a farmer's wife to her cowherd, "come awa' in to your parritch, or the flees 'ill be droonin' themsel's in your milk bowl."

"Nae fear o' that," was Jock's roguish reply. "They'll wade through."

"Ye scoondrel," cried the mistress indignantly, "d'ye mean to say that ye dinna get eneuch milk?"

"Ou, ay," said Jock, "I get plenty o' milk for a' the parritch."

The melancholy interest which attaches to the unfortunate illegitimates of the great is sufficiently related in Hector Fleishmann's "Unknown Son of Napoleon" (John Lane; $3 net). It might more properly have been entitled an unfortunate or unwelcome son, for Count Léon was only too well known under the Second Empire, pestering his cousin for interviews and money. After sinking lower and lower in life, this eldest son of Napoleon died in Paris in 1881, and was laid in a pauper's grave by the side of the nameless poor and needy. He left four children, one of whom, following the spirit of adventure innate in the Bonaparte family, became a leading light in Buffalo Bill's Wild West Show. In the first half of his volume the author reveals the seamy side of the domestic life of a certain Revel, paymaster of dragoons, and his pretty eighteen-year-old wife, Eléonore Denuelle de la Plaigne, who in 1806 became by Napoleon the mother of Count Léon. The Emperor manifested a certain affection for this boy, who was proof that Josephine's childlessness was not due to her imperial husband's incapacity. He secretly acknowledged his own paternity by placing Léon under the guardianship of the Meneval family and by making financial provision for him. The second half of the volume is devoted more particularly to describing Count Léon's unfortunate and unedifying downward career. Under Louis Philippe's Government, when the Napoleonic legend was swelling under the influence of Thiers and Béranger and the St. Helena literature, Léon became a member of the National Guard and enjoyed a certain specious popularity on account of his striking physical resemblance to his father. But already he had got into difficulties by his spendthrift habits and worthless associates His cousins and uncles would not receive him. This led to the farcical attempt at a duel with Louis Napoleon on Wimbledon Common in 1840, when the Bow Street police interfered and Boston's benefactor, Joshua Bates, went bail for the future good behavior of his Napoleonic friend. In an appendix the author examines the stories as to Napoleon's other alleged children; he concludes that only three are proved—Count Léon, Count Walewski, and the King of Rome.

Wilson King's "Chronicles of Three Free Cities: Hamburg, Bremen, Lübeck" (Dutton; $4 net) does not profess to add anything to German historical research into the past of the three remaining Hanseatic cities; it is rather a modest but assiduous attempt on the part of one well qualified by residence and reading to arouse in English and American readers an interest like his own in records of civic and commercial achievement. An introduction by J. P. Mahaffy gives a

brief survey of the development of trading cities from Tyre to Liverpool, and calls attention to the European aspect of Mr. King's subject. Mr. King's own narrative is quite detailed and circumstantial, everywhere sympathetic, and nowhere dull. Numerous illustrations in black and white, and a few in colors, have been contributed by Mrs. King and others. They not only serve the purpose of vivifying the narrative, but are excellent in themselves.

A. W. Holland's "Germany" in the series called The Making of the Nations (Macmillan; $2 net) gives in a sober style an authentic outline of German history from the time of the migrations to the end of the year 1913. From the nature of the case, the greater part of the book is a record of wars, but there are brief considerations of the causes and the results of conflicts, as well as of public policies and public and private achievements. The book is illustrated with maps and many good photogravures.

In "John Hay: Author and Statesman" (Dodd, Mead; $1 net), Prof. Lorenzo Sears gives a pleasant eulogy of the American public man who, more than any other of his time, seems to have taken hold on the hearts of his countrymen. Hay's work as Secretary of State has passed into a legend, and Professor Sears carries forward the idealizing process. We do not imply that much of this idealization was not justified; we merely wish that the eulogist had had more acquaintance with the inside facts of Hay's life and work so that he could have made a more solid memorial of him. We get a little impression of one

> too good
> For human nature's daily food,

which Hay himself would have been the first to smile at and disavow.

We have before us three additions to the already mighty company of Napoleonic books of recent arrival. Of these, Major Arthur Griffiths's "Life of Napoleon" (Philadelphia: Lippincott; $1.75 net) is hardly a biography in the modern sense; rather a story pleasantly retold. The work appears without prefatory excuse, nor are we enlightened as to the class of reader for whom it is intended. Scarcely for young searchers after truth. Perhaps the old may read it and feel young again—safe in that they are beyond being misled by the art of the story-teller. It is enlivened by an attractive Napoleonic portrait gallery. The title of William Henry Hudson's volume, "The Man Napoleon" (Crowell; $1.50 net), is its justification. It is, in fact, a careful and eminently readable study of the life of the great Corsican, disengaged, so far as possible, from history, "which is treated only as the background and setting of his career." For this relief, much thanks. Drum and trumpet history, under guise of biography, is fast becoming an intolerable nuisance. The author's own feelings in regard to Napoleon's character—"not admiration, but aversion, not unmingled with pity and contempt"—are not allowed to tinge his narrative, which is candid and judicial throughout. The illustrations are unusually good. In "The Decline and Fall of Napoleon" (Philadelphia: Lippincott; $1.25 net) is republished, in book form, a series of articles by the late Viscount Wolseley which originally appeared in the *Pall Mall Magazine*. Intended as a study of the strength and weakness—as exhibited in his last disastrous campaigns—of the leader whom the author regarded as "a superhuman genius" and "by far the greatest of all men," these collected papers have a special appeal just now, bringing out, as they do, many points of comparison and contrast in Napoleon's final struggle with that at present raging. Then, as until quite recently, Russia was, from a military point of view, the unknown quantity. Then, as now, unhappy Belgium was the cockpit of Europe.

From the days of Tristram Shandy onwards we have had many studies under many names of the engaging personality that has gained world-wide recognition as "Mr. Thomas Atkins"; there has been none more convincing, more revealing, or more lovable than that sketched in the little collection of extracts from his own letters from the front, entitled "Tommy Atkins at War, as Told in His Own Letters" (McBride, 50 cents), and ably edited by Mr. James A. Kilpatrick. His pluck, his kindliness, his patience, and his good-nature stand out the more compellingly because their expression is so unstudied; and we realize, if we contrast them with the most capable literary "studies" from the outside, how ineffective is the *mot juste* when compared with the plain truth. Naturally the editor of these letters has sought here and there to point the moral, but his intrusions are delicately conceived, and do not spoil the picture. To gain some real idea of the actual conditions under which the greatest of wars is being fought and of the personalities which make up one of the contending forces the possession of this little book is imperative. Incidentally, although it is from the nature of the case one-sided, the editor has striven to be fair to the brave men who are dying for the other side of the argument, and it is perhaps a pity in this connection that certain references to "barbarities" in the chapter Tommy Atkins and the Enemy, obviously written in the very heat of battle, were not omitted.

There was need of a short history of India, "up to date" in respect of geographical and racial information, and in "Ancient India from the Earliest Times to the First Century A. D." (Cambridge University Press; Putnam; 75 cents), E. J. Rapson, has filled the need. Not so archæological as the volume on "Antiquities of India," recently reviewed in these columns, this little book is yet based on both literary and monumental evidence. Its author is well known as an authority on numismatics, and he has brought to the making of this work a great store of knowledge from his own field. Coins and inscriptions are of prime importance in constructing the history of a land practically without a history of its own. Especially is this true of the debatable reigns of kings after the third century B. C. For the still earlier period, Professor Rapson offers no new material save that which shows the Dravidians to have been not original inhabitants, but invaders from the northwest, like the Aryans. It might have been said also that the Aryans themselves probably entered India in different hosts of different dialectic characteristics. Of the civilization of the earliest literary period, not 3000 but circa 1200 B. C. the author gives an excellent summary in which modern German scholarship has not been neglected. By the third century B. C. the admirable survey begins to show the result of the author's independent researches. Here, too, is room to question whether some of Professor Rapson's statements may not be adversely criticised, notably in regard to the extent of Asoka's kingdom, which was perhaps less firmly established in the south than the author asserts. But in general the student may thankfully accept so readable and trustworthy a manual of Indian history and geography as is here presented, particularly as it contains a mass of matter hitherto inaccessible save to specialists.

Dr. Alexander Campbell Fraser, professor emeritus of logic and metaphysics in Edinburgh University and a writer on philosophical subjects, died in Edinburgh on December 3. He was born at Ardchattan Manse, County Argyll, Scotland, in 1819, the son of the Rev. Hugh and Maria Helen Campbell Fraser, and was educated at home and at Edinburgh University. He was professor of logic at New College, Edinburgh, 1846-56, and from 1856 to 1891 was professor of logic and metaphysics in Edinburgh University, in succession to Sir William Hamilton. From 1850 to 1857 he was editor of the *North British Review*. Dr. Fraser received the honorary degree of D.C.L. from Oxford in 1883, that of LL.D. from Princeton in 1856, from Glasgow in 1871, from Edinburgh in 1891, and from Aberdeen in 1906. He also received the honorary degree of Litt.D. from Dublin in 1902. He was Gifford lecturer in natural theology in Edinburgh, 1894-96, and became a Fellow of the Royal Society, Edinburgh, in 1858, and a Fellow of the British Academy in 1903. Among his publications were: "Essays in Philosophy," 1846-56; "Essays, Philosophical and Miscellaneous," 1858-68; "Collected Works of Bishop Berkeley," annotated; "Life and Letters of Berkeley," 1871; "Berkeley in Philosophical Classics," 1881; "Locke in Philosophical Classics," 1890; "Locke's Essay on Human Understanding, with Prolegomena, Notes and Dissertations," 1894; "Thomas Reid," a biography, 1898; "Philosophy of Theism," 1898; "Locke as a Factor in Modern Thought," read in the British Academy on the bicentenary of Locke's death, 1904, and "Berkeley and Spiritual Realism," 1909.

A protective-tariff expert, a leader in Congress and a member for so many years without break as to have become the Father of the House, yet one whose sole contribution to permanent literature consists of a pamphlet reprint of one speech, and whose name does not appear in any of the standard encyclopædias, is a curiosity in these days of self-exploitation. Such a man was the late Sereno Elisha Payne, Representative from the Auburn district of New York State. Like his old-time colleague, John H. Ketcham, of Poughkeepsie, he had mastered the art of speaking by his very silence; and he had acquired such a standing in the neighborhood of his home that he was returned, term after term, without any effort on his part. There was nothing picturesque about his personality, as about that of every other member of the little group with whom he acted. He had not Reed's wit or Dolliver's eloquence, Cannon's quaintness or McKinley's charm, Kelley's weight or Dingley's plodding patience. His chief stock in trade, where his official manner was concerned, was a smiling, but not the less deadly, indifference to what any opponent said or thought. When Reed,

as Speaker, wished to put temporarily in the chair a fellow partisan whom he could trust absolutely to hold down the minority while the Republicans turned out a couple of Democratic Representatives whose seats had been contested, he called upon Payne, whom he knew no arguments could convince, no sophistries disturb, no threats alarm. Payne proved worthy of his confidence. Bailey of Texas might roar "No quorum!" at him, and McMillin of Tennessee fling contemptuous epithets in the face of the majority, but the temporary tenant of the chair paid no more heed to them than to the winds which blew outside of the chamber: he would neither reverse his rulings nor entertain an appeal, but, looking not to right or left, kept his gavel beating its relentless tattoo on the desk till the two Democrats were out and the contesting Republicans were in.

It was the same way with his share in general debate. No man on the floor of the House prepared his basic data in advance with more care, and then he never allowed any one to bait him by drawing him into a controversy over details. He disposed, with his characteristic smile and his equally characteristic silence, of even so tempting a critic as the late Francis W. Cushman of Washington, who, taking for his text Payne's explanation that hides ought to come in free because they were only a by-product of the live stock which were protected by strong duties, insisted that, by parity of reasoning, milk and eggs should have their tariff rates removed.

Mr. Payne was not without a sense of humor, though the joke must be pretty plain to find him instantly appreciative, and he rarely, if ever, told one himself. Moreover, he was cautious almost to suspiciousness in dealing with men whom he had not known long enough to understand thoroughly. It is not surprising, therefore, that he passed among his associates as a dependable rather than an attractive man. Nearly every one had a pleasant word for him, and his quarrels were too few to be remembered; but, though an old friend here and there addressed him as Sereno, he never achieved a nickname, even of the affectionate sort.

The life of the late William Woodville Rockhill had in it a lesson for ambitious youth, for it showed the value, both to himself and to the world, of having a hobby which carried him somewhere. Rockhill's hobby, which he rode from youth, was Tibet, the country of which, from Marco Polo's time to his, so little was known and so much imagined. He began preparing, in his college days, for his work as an explorer by taking a special course in Chinese along with his studies of other living languages, and after graduation sought an appointment as a secretary of legation at Peking for the purpose of perfecting himself in both Chinese and Tibetan. This was no easy task, since every one thereabouts who knew the language of Tibet became suspicious of his designs as soon as he expressed a desire for instruction, and most of what he learned he had to acquire by stealth. After four years of such self-training he took his first plunge by disguising himself as a Chinese priest and crossing the border of the Forbidden Land. This trip consumed about a year, during which he discovered how to make his way about and divested himself of the notion, then so commonly held in Western Europe and the United States, that the Tibetans were merely intractable savages. Thus he paved the way for a more extended and fruitful tour which he made a year or two later, accompanied by a small retinue of Chinese servants and a bodyguard of ten native soldiers hired from a chief whom he found not wholly impervious to the influence of foreign coin, and equipped with a photographic camera and a few surveying instruments.

How little of a pleasure-jaunt this journey was may be inferred from the fact that in one period of eleven months he covered about eight thousand miles, making his way in the most primitive fashion; crossed sixty-nine passes ranging from 14,000 to 18,000 feet above sea-level; lived sixty days at an altitude of 15,000 feet, with clothing continuously soaked by storms of rain, hail, or snow, and was unable during this interval to procure any food worth mentioning, and no drink but tea. Yet with all their soaking and freezing and starving, his party knew not a single hour's illness from the day of leaving China proper till the day of returning thither. The geographical and ethnological data he brought home with him, and the extraordinary collection he made of articles of personal adornment, domestic implements, and paraphernalia used in religious rites, gave his two excursions high rank among modern scientific enterprises of travel. One of his discoveries, of some significance to Americans, was the likeness between many of the Tibetan towns and the Indian pueblos of Arizona and New Mexico, the resemblance pervading not only situation and architecture, but also the life and worship of these widely separated communities.

NOTES FROM ABROAD.

Through the wall of official unanimity that has been thrown round Germany, an occasional dissentient voice makes itself heard. Dr. Martin Rade, Protestant pastor in the University town of Marburg, is editor of the *Christliche Welt*, and was to have spoken at the proposed international congress of Christian Socialism, at Basel, in Switzerland. Instead he writes:

I can not but deplore the Imperial Chancellor's fashion of treating the question of neutral countries (in his speech of August 4 before the Reichstag), for it was not necessary to have recourse to so dubious a proverb as "Necessity knows no law." With such a proverb he will never be able to persuade those who see in the possibility and existence of neutral countries a triumph of the law of nations. This is why it will be hard to mend the harm done by the German Empire's not keeping clear from the start of the fault committed by violating the rights of the Belgians. I defy any one to say that this thought of mine is unpatriotic.

The needs disclosed by the present war have already stimulated the French Government and people to significant precautions for the future. The Minister of Public Instruction has worked out a plan for the general physical training of French young men from the age of fifteen to eighteen years. A beginning was made at a meeting of the authorities and professors of Paris colleges with representatives of the federations of sports, physical culture, and military preparation. The rector of the University of Paris, M. Liard, whose position places him at the head of the academic institutions of the capital and surrounding region, presided. He explained that one duty was urgent on all, to train up and prepare for the country and its army the young men who will be summoned to-morrow to take the place of their elders in the life of the community. The Minister has named as delegate Pierre de Coubertin, who some twenty years ago gave prizes in several American universities for French work, and, in his own country, has headed the movement towards athletic sports as well as taking a leading part in the international Olympic games. He spoke at some length of the necessity of bringing into the habits of Frenchmen the cultivation of their physical person:

The Englishman cultivates freely his muscular machine. He considers it a patriotic duty to be in perfect physical condition, in the fulness of muscular efficiency, and to possess the best of health by severe hygiene. The effects of such education have admirable consequences when applied to war. In excellent physical condition and accustomed to this severe hygiene, the English soldier supports remarkably the inclemencies of weather; and, whenever he has the least leisure and finds the slightest means, he applies himself to the cares of cleanliness.

M. de Coubertin went on to explain the work in which Government thus takes the initiative—to form in all young Frenchmen, by appropriate exercise in gymnasiums and the open air, a state of mind which will lead them to prepare themselves for physical culture and resistance of body, so that they may be ready to become robust soldiers. Training centres, under professionals and monitors, are to be established throughout Paris and the suburbs within the means of all. The Hébert method will be used for marching, foot-racing, jumping, throwing, swimming, boxing, and single-stick. For students these centres will work in connection with their schools; for young men living in their families there will be convenient centres. For greater exercises the municipal and military authorities of Paris have been asked to give the land in the Champ de Mars which American visitors to universal expositions will remember as the site of that immense piece of steel engineering, the Galerie des Machines. All professionals of athletics have been invited to help in this revival of national physical culture—and preparation.

Ferdinand Hodler, a Swiss painter who has won wide recognition in Germany, signed the collective protest of writers and artists of Geneva against the bombardment of Rheims cathedral. In consequence, the Cologne Gallery has taken down a painting by him and replaced it by an accusing inscription. The Secession Salons of Berlin and Munich, and now that of Vienna, have dropped his name from their list of members. The University of Jena had one of his best-known pictures, Departure of Students in the Napoleonic Wars. This it now offers for sale, the money to be given to the German Red Cross. The venerable Professor Haeckel has charged himself with this exemplary punishment, and, at last reports, had received a bid of 20,000 marks. Gunsburger, of Geneva, who already has forty paintings by Hodler, is organizing an exhibition of his works, with the proceeds of which he hopes to buy back the University-spurned picture for the artist's native and neutral Switzerland.

Science

THE NATIONAL ACADEMY OF SCIENCES.

The autumn meeting of the National Academy of Sciences was held on December 7, 8, and 9, at the University of Chicago, for the second time in its existence. Although a rather small number of members were present, on account of the late date and the distance from the homes of the majority, an unusual number of papers were read, thirty-six in all, largely by guests of the Academy. The variety and interest of these papers, distributed among astronomy (8), mathematics (6), physics, chemistry, and zoölogy (5 each), botany (4), physiology (2), and geophysics (1), served to emphasize the strength of this region as a centre of scientific research.

W. W. Campbell, of the Lick Observatory, in a paper on "The Radial Velocities of Nebulæ," gave an account of results obtained during tbe last three years at the Lick Observatory and its branch at Santiago, Chili, on the determination by the spectroscope of the velocities of fifty-four nebulæ towards or away from our system. These nebulæ are found to have very high velocities, which are not, as in the case of the stars, distributed according to the law of probability. The average velocity of these nebulæ is seven times the average velocity of the helium stars, which have generally been supposed to be the stars most recently evolved from nebulæ. There is thus some basis for the suggestion that planetary nebulæ have been formed from the rushing of high-velocity stars through space. George E. Hale, of the Carnegie Institution Solar Observatory at Mt. Wilson, presented a paper on "The Direction of Rotation of Solar Storms," in which he followed up the consequences of his remarkable discovery that vortical whirls in the atmosphere of the sun produce magnetic fields large enough to displace the spectrum lines, by the detailed study of the direction of rotation in such vortices. It was soon noticed that sun-spots rotating in opposite directions are found in the same solar hemisphere, but these are easily explained as opposite ends of a single vortex like that made by a paddle in water. It is found that the sun may be divided into zones, symmetrical with respect to the equator, in each of which the rotation is in a particular direction, which is different before and after the sun-spot minimum. E. E. Barnard, of the Yerkes Observatory, presenting an "Explanation of Certain Phenomena of the Tail of Comet Morehouse," made use of a beautiful method of examination of the shape of the tail by combining in a stereoscope two photographs taken simultaneously in Europe and America. The distance apart of the stations was amply sufficient to bring out the stereoscopic effect and to show that the tail was not merely bent, but actually twisted, presenting somewhat the appearance of a ring of cigar smoke. This was accounted for by the comet's ceasing for a short time to emit the matter composing the tail, which drifted off under the influence of some disturbing body.

A. A. Michelson, of the University of Chicago, in a study of "The Behavior of Metals and other Substances near the Rupture Point," showed that the elastic yielding takes place as if the metal were formed of three substances which act differently, the first being perfectly elastic and resuming its form when the stress is removed, the second dragging behind, and the third acting like a viscous body, not, however, according to the ordinary simple law making the viscous resistance proportional to the velocity, but more nearly to the square root of the velocity. The more often the metal is subjected to the repeated stress, the harder it becomes, so that steel may attain twice its normal hardness before breaking. An ingenious model was shown which closely imitated the phenomena described. C. T. Knipp, of the University of Illinois, in a paper on "Experimental Data on the Stability of Positive and Negative Ions," studied the motion of the positive rays sent off from a lime cathode in a vacuum tube. These rays receive an acceleration by being passed through a strong electric field, and their deflection by a magnetic field is studied by photography in J. J. Thomson's manner. Certain anomalous lines on the photograph are accounted for by supposing that the positive ion is more stable than the negative, that is, that a negative ion loses an electron more easily than does a positive ion.

T. C. Chamberlain, of the University of Chicago, in a paper on "The Fundamental Segmentation of the Earth," undertook to explain the chief surface forms of the earth as a result of stresses due to changes in the earth's period of rotation, due to its growth as postulated by the author's celebrated planetesimal hypothesis. The solid earth would first yield by bulging equatorially, and the attempt was made to explain the yielding by a sort of triangular division in which the segments were separated by lines of easement of the stresses, and these subdivisions were shown to agree in a certain manner with the great continental divisions of the globe.

A. J. Carlson, of the University of Chicago, in "Some New Observations on the Physiology of the Stomach in Man," created much interest by a graphical depiction of the pangs of hunger. He had had the advantage of a human subject with a fistula, or hole an inch in diameter in his stomach, through which all food had to be introduced, and which also permitted the introduction of apparatus, such as a balloon, for measuring pressure and showing contractions of the stomach. By other subjects the balloon could be swallowed, and the record obtained. The curves showed the rhythmical contractions of the stomach, each of which corresponds to a pang of hunger, and the reaction to various stimulations were plainly visible. The effects of fasting for a number of days, even after the sensation of hunger had ceased, could be traced by the curves.

Shiro Tashiro, of the University of Chicago, in a paper on "The Nature of Nerve Impulse," attacked the difficult question suggested by the fact that lack of fatigue and absence of heat production during stimulation of the nerve have led physiologists to suppose that the nerve impulse is transmitted without consuming any material. By means of a very delicate new apparatus, which can measure as little as one-ten-millionth of a gram of carbonic acid, it was shown that a living nerve gives off a definite amount of carbonic acid, and that stimulation increases this amount. From the evidence it was concluded that nerve impulse is a propagated chemical change, the propagation being due to restoring the equilibrium which was disturbed first at the point of stimulus.

In a study of "The Fertilizing Power of Sperm Dilutions," F. R. Lillie, of the University of Chicago, gave evidence of the truth of the theory that the fertilizing power of spermatozoa is due to a definite substance, which is lost as time goes on, so that a spermatozoön may be perfectly motile after the loss of its fertilizing power. It being assumed that an egg may be fertilized by a single spermatozoön, eggs placed in series of suspensions of sperm in sea-water of increasing dilutions should act as follows: Up to the point where each egg receives a single spermatozoön, every egg should be fertilized; beyond this the fraction of the eggs fertilized should fall off at first slowly, then rapidly, and then should decrease asymtotically to zero. This is not found to be the case unless the time is very short. A glance at the curves shows that, as the time increases, say, from five to twenty minutes, the curve falls to almost zero at a very much less dilution than before; hence the conclusion stated above. W. L. Tower, of the University of Chicago, in a study in experimental evolution entitled "Experimental Production of a New Character," succeeded by changes in the environment of the potato beetle, by exposure to heat at certain periods of growth, in producing definite changes in the form and size of the antennæ, usually considered as highly invariable organs. The changes thus produced are not known to exist in any living or fossil insects of the sort, but are formed in three states of instability, all capable of being transferred to other species through crossing, thus giving a picture of what may be one method of the production of nearly related genera.

A prominent place in the meeting was taken by the second series in the William Ellery Hale memorial lectures on evolution. At the spring meeting the introductory lectures were delivered by Sir Ernest Rutherford on "The Evolution of Matter," and at this meeting the course was continued by two lectures on "Stellar Evolution and the Formation of the Earth" by Dr. William Wallace Campbell, director of the Lick Ob-

servatory. The lecturer gave a masterly presentation of this wide subject, taking his auditors from the farthest limits of the universe to the consideration of the smallest meteorite. Since the only way we have of studying the stars is by means of their light, it should be understood that in the very largest telescope a star, even though millions of miles in diameter, appears only as a point of light without size. In the many splendid photographs shown this is not the case, for reasons belonging to photography. In all the enormous number of visible stars no changes take place in man's lifetime, with the exception of the new stars, the clouds of Jupiter, and the sun's surface. The evolution spoken of takes times that may be measured in thousands or millions of years. It is estimated that there are about sixty to seventy million stars visible to the telescope, but this is but a small fraction of the whole number. They are supposed to form a universe of lenticular shape, of which the Milky Way shows the greatest dimension. Astronomical distances are so huge that they are estimated in light-years, that is, the distance that light, which travels 186,000 miles per second, travels in one year. Thus the nearest star to us is distant by four and one-half light-years. A star may be at a distance from its next neighbor of 80,000 light-years, while the distance from the centre to the boundary of the universe is estimated at 450 millions of light-years. Thus the stars may be in very rapid motion without seeming to change their places. The proper motion, that is, motion as it would be seen on a star map, is measured by the telescope directly, while the motions towards or away from us are measured by the displacement of the lines in the spectra. In this way it is found that the average velocity is at the rate of about nineteen kilometres per second of approach.

The earliest bodies in point of evolution are the nebulæ, or great clouds of hot gas, which all emit a characteristic spectrum, containing a line not elsewhere found, characteristic of a substance that has been called nebulium. Of these the most interesting are the great spiral nebulæ, which are enormously far off, and which avoid the Milky Way. Keeler estimates that there are one hundred thousand nebulæ visible in his telescope. By a careful comparison of the motions of all the stars that have been studied, Kapteyn has concluded that the stars may be divided into two groups, in each of which the direction and magnitude of the velocities are distributed at random, but the two groups are drifting through each other, a result intrinsically improbable, but difficult to escape.

The spectra of the stars have been arranged according to a certain classification, originated at Harvard from the results of the large number of spectra obtained by the Henry Draper telescope. It has been found that the velocity of motion of the different stars is closely connected with their spectral types, and in this way the relative age of the stars has been arrived at. Although a large and a small star may develop differently, the radiation of heat is the main factor in their development. A hot sphere of gas would tend to expand, but the mutual gravitation of its different parts causes it to contract. The work done by the forces in the contraction generates heat, so that the contraction is resisted, and then a portion of this heat is lost by radiation, so that the problem of equilibrium is a complicated one. As the temperature changes, the color and hence the spectrum change. Helmholtz calculated that a shrinkage of the sun's diameter of only forty-five feet per year would suffice to provide all the heat that it gives out, but we now know that the phenomena of radio-activity will provide immense stores of energy from atomic changes.

Our sun is a star that has cooled down so long that its spectrum is traversed by thousands of black lines due to absorption in the cooler layers of the atmosphere by which the sun is surrounded. These belong to a large number of metals which appear late in the life of a star. The solar system, best known to us because nearest, is composed of the sun, eight major planets with their twenty-six moons, about eight hundred minor planets, and meteorite swarms, but of all this the sun contains about 744 parts of mass to one part for all the rest. The orbits of all these bodies lie so nearly in one plane that the whole system could be contained in a flat box, the thickness of which was not over one-sixtieth of its diameter. Nearly all these bodies revolve around the sun in the same direction, only a few satellites going the other way. Of the various theories of the genesis of the solar system, Laplace's famous nebular hypothesis was not considered the most probable. Considerable and favorable mention was made of the planetesimal hypothesis of Chamberlain and Moulton, and the possible method of generation of the solar system from a spiral nebula was clearly described, as well as the generation of such a nebula itself. Finally, the origin of the moon was taken up, and the question whether it broke off from the earth, as assumed by Darwin and Poincaré, was examined. It was noticeable how many American names were mentioned as of importance. This extremely fragmentary account is perhaps sufficient to indicate the tremendous scope of the subjects dealt with by the lecturer, and the value to the public of the William Ellery Hale Foundation.

The Academy was most hospitably entertained by the University of Chicago, an evening reception being given by the president, and a very pleasant dinner by the Chaos Club, an "organization" of unorganized scientific workers in this region.

ARTHUR GORDON WEBSTER.

Clark University, December 12.

"Billy and Hans," by W. J. Stillman and "Billy" by Maud Thornhill Porter, two charming stories, the one of a pair of squirrels and the other of a canary, have been reprinted by Mosher in most pleasing type and equally unpleasing covers. Both are too well known from their earlier publication to need extended comment.

Drama and Music

Mr. Witter Bynner, whose work as a realistic poet has already attracted some favorable critical attention, has published a one-act play, "The Little King" (Mitchell Kennerley), which undoubtedly would be effective in stage representation, if a child could be found capable of giving a life-like interpretation of the principal character. His hero is the unfortunate little Louis, son of Louis XVI and Marie Antoinette, and his scene the cell in the Paris Temple, where the boy is imprisoned under the savage guardianship of Antoine Simon. The time chosen is the hour of the Queen's execution, and the use made of that tragic incident shows rare dramatic discernment. Barelle, the mason who has been employed to build up the windows of the cell and convert it into a dungeon, is a royalist agent who has bribed Jeanne Marie, Simon's wife, to permit the substitution of another little boy, Robert, for the captive prince. The latter, who consents to the plot, without realizing its significance, and who still believes his mother to be alive, is detected in the act of changing clothes with his substitute by Simon, who threatens to denounce his wife and everybody concerned in the conspiracy in order to obtain his own reward as a patriot, and, at the same time, brutally tells Louis that the bells which he has heard, and to which he has been made to dance, were the signal of his mother's death on the scaffold. But he changes his tune when he hears of the money to be earned, and straightway becomes eager to perfect the escape. The prince, however, inspired by parental memories, and foreseeing Robert's fate in his own, rises to royal heights, resolutely refuses to flee, and bids the faithful Barelle, on his allegiance, to depart. The curtain falls upon him standing alone, in his darkened cell.

In the matter of construction, the piece is uncommonly skilful. The action is compact, swift, and full of illuminative incident, the characterization apt and vivid. The ferocious, drunken, ruthless Simon; the blasphemous and greedy Amazon, Jeanne, and the religious and monarchical zealot, Barelle, are all drawn with a sure and realistic touch. And the boy Louis is an admirably fresh and truthful study of simple, intelligent, spirited, sensitive, and affectionate childhood, all the more convincing and affecting because it is so entirely devoid of mere sentimentality or gush. Most children invented for the theatre are impossible prigs, but this one is a living and noble little creature. In nothing is the literary art of the author more clearly manifested than in the forcible and appropriate quality of his dialogue—although exception might fairly be taken to occasional expressions which are of such modern origin as to be clearly anachronistic. He set himself a very difficult task when he undertook to be conversationally realistic in blank verse. That he has been exceedingly adroit in making some of the crudest phrases of his illiterates conform to the exigencies of metre may be readily admitted, but the effect of them, nevertheless, is somewhat anomalous. On the other hand, it should be noted that his scrupulous avoidance of any indulgence in rhetorical or poetic flights, which would have impeded the action, and been unnatural in the circumstances, is a proof of his conscientious artistry. It re-

mains true, however, that the dominant excellence of the play is dramatic rather than literary, although a talk between the two boys, in their privacy, is altogether charming in its simplicity, grace, and naturalness. Mr. Bynner has written a first-rate one-act play, but whether he could, to-day, find actors capable of doing justice to it is exceedingly doubtful. Good luck attend him!

A play in four acts, "A Friend of the People," by Theodore Bonnet (San Francisco: Pacific Publication Co.), is a work of decided ability, with qualities which seem to fit it eminently for the theatre. It is well made, tells an interesting story dealing with contemporaneous politics, and contains a number of effective situations arising legitimately out of character and circumstance and culminating in a logical catastrophe. It is introduced by a prefatory epistle in which the author relates his experiences with various theatrical magnates, who, after lavishing encomiums upon the dramatic and other qualities of the piece, have declined to produce it, because it does not have a happy ending, which, in the prescribed conditions, would be ridiculous. The case which he makes out for himself, as against the managers, is unanswerable, and what he has to say about the general incapacity of most of our theatrical directors to judge the merits of a play in manuscript, or to estimate public discernment at its true value, is sound and forcible. But the facts which he cites are sufficiently notorious, and nothing would be gained by repeating them. The mere fact that he treats his subject from a different point of view from that which has been adopted in the political plays which have recently proved profitable is a sufficient explanation of the managerial mistrust he has encountered. In construction and general workmanship, his play is unquestionably superior to most of the political dramas which have lately been successful, and, should it be well acted, the production of it might prove a very remunerative experiment. The one valid objection to it, that its spirit is reactionary in its attitude towards certain types of modern reformers, would not be likely to antagonize greatly the average theatrical audience. His hero is a hypocritical man and corrupt politician, of engaging parts and abilities, who has won his way to the Governorship of a great State, and a prospective United States Senatorship, by demagogic acts, life service to idealists of all kinds, and secret traffickings with the powers of darkness. His infidelity to his mistress, the wife of one of his best friends, a woman who has believed in him implicitly and who has been of great service to him, is the cause of his final overthrow. Discovering his baseness, she allies herself with his enemies, contrives his exposure, and puts him in a position so utterly hopeless that he seeks refuge in suicide. Thus baldly stated, the plot seems extravagant and sensational, but it is elaborated with uncommon skill and in full accordance with the acknowledged laws of dramatics. Technically the play is extremely well written, and the different personages in it, although unmarked by any great creative originality, are sketched with notable observation and consistency. If they belonged to a higher order of humanity, if they suggested broad conceptions rather than faithful copies, they might pass for genuine psychological studies; certainly they are much more realistic than the ordinary puppets of melodrama.

Recent books on musical subjects which will be reviewed later are "Musicians of To-day," by Romain Rolland (Henry Holt); "Nature in Music," by Lawrence Gilman (John Lane Co.); "My Path through Life," by Lilli Lehmann (Putnam); "Stories from Wagner," by J. Walker McSpadden (Crowell); "Bluebeard," by Kate Douglas Wiggin (Harper); "Orchestration," by Cecil Forsyth (Macmillan); "Music on the Shakespearean Stage," by G. H. Cowling (Cambridge University Press); "Graded Lessons in Harmony," by F. H. Shepard (Schirmer); "The Choirtrainer's Art," by A. Madeley Richardson (Schirmer).

An excellent new score for voice and piano of Bizet's "Carmen" has been published by the Oliver Ditson Co. to meet the renewed interest in this opera sure to be aroused by its revival at the Metropolitan. It is clearly printed on good paper, and below the French text is the English version by Charles Fontayne Manney. But what makes this edition particularly desirable is an introduction of fourteen pages by Philip Hale, who is an authority on French music of the past and the present, and who has read nearly everything written by French journalists and authors on Bizet's masterwork, judging by his numerous brief citations. That "Carmen" was a failure when first produced in Paris, and that this failure broke the composer's heart and hastened his death, is now established beyond all doubt. The saddest part of the story is that, stunned by the chorus of disapproval, Bizet said: "Perhaps they are right." Mr. Hale tells the story of the opera, as well as its history, and briefly analyzes its characteristics. He has also furnished a similar introduction to a new edition of Gounod's "Faust," issued by the same publishers. Though not a failure, "Faust" also was not appreciated at anything like its value when first performed. Gounod had difficulty in finding a publisher for the score, and finally had to content himself with $2,000 for all the rights for France and Belgium, one-third of which sum went to his collaborators. Mr. Hale gives a list of all the Marguerites heard in Paris up to 1912. It includes three famous Americans—Nordica, Eames, and Farrar. The English version in this edition is that of Chorley, while the vocal score is the arrangement by Léo Delibes. Among other recent publications by the Ditson Company are "Thirty Offertories for the Organ," edited by James H. Rogers, and the second volume of the "Anthology of German Piano Music," which is devoted to modern composers from Schubert to Max Reger. There is again a helpful introduction by Moritz Moszkowski. The offertory is, in the opinion of Mr. Rogers, "the organist's best opportunity for making the organ a vital and integral part of the service as a solo instrument." His thirty selections are made from the works of French, German, Russian, and other masters, and there are brief biographic sketches of these.

Lilli Lehmann, according to her interesting autobiography, an English version of which, under the title of "My Path Through Life," has just been published by G. P. Putnam, says she was born in 1848. At sixty-six it is wonderful that she can sing Weber's "Ocean" aria and Beethoven's "Abscheulicher" in such a way as to have it said that "that was vocal art of the highest order. What breath control, what superb phrasing, what beautiful portamenti, and what a fine attack. That was real bel canto. Mme. Lehmann received a well-deserved ovation."

Dr. Muck believes that the war cannot fail to have, in the end, a strongly beneficial influence on the artistic productions of Europe. In a conversation with Olin Downes, printed in *Musical America*, he expressed the opinion that the primal verities would be felt once more. Simplicity, sincerity, music which appears because it must appear, music which is farthest from fad or the desire for pecuniary gain, may reasonably be anticipated. And he broke off: "But what is the use? Who will want music for the next hundred years in Europe? They will want houses and food. Where will it end?"

Holland's principal orchestral association, Concertgebouw of Amsterdam, will give its usual number of concerts this season, and all the soloists engaged will appear.

About 30,000 addresses of musicians are included in the thirtieth annual issue of Max Hesse's "Deutscher Musikerkalender," just published in Leipzig. There are no French or English addresses, but this, evidently, is not an omission due to hostile feeling, for the Russian and Belgian musicians are included.

Art

BOOKMAKING.

The Art of the Book: A Review of Some Recent European and American Work in Typography, Page Decoration, and Binding. Charles Holme, Editor. New York: "The Studio," Ltd.

For some years the "art of the book" has been unobtrusively brought before our public. Picking out individual effort almost at random, one may cite the typographic work of the late T. L. De Vinne, the book decoration of Will Bradley, the agitation of technical periodicals, such as *Printing Art* or the *Graphic Arts*. Some of us may find these efforts rather sporadic, the results an occasional good book rather than an output habitually good. But the spirit and the will to do are strong enough to make the present review of more recent—as well as earlier—work a welcome supplement to the books on illustrating by Pennell and by Walter Crane, or the later one, on German work, by Grautoff.

The countries embraced in the review under discussion are England (taking up nearly one-half of the book), Germany, France, Austria, Hungary, Sweden, and America, and the field included is large: typography, illustration, decoration, covers, end-papers, and binding. The presentation—particularly for the Continental European countries—is therefore summary, yet one gets a fair impression of the result of the application of quite different national and individual points of view to the problems of bookmaking. That not a little of the most modern work shows a spirit of oddity, of unrest, of nervousness, in decoration, and of want of simplicity in bindings, is natural. But the best in all

this, that based on the honest desire to find the right way, will live; mere striving after novelty has never the germ of lasting success. As L. Deubner points out, in the chapter on Germany, there have been many "artist" designs for type which have not lived. That will inevitably happen whenever there is a striving for "artistic" effect which loses sight of a practical object. In Germany, by the way, as far back as 1900, there has been a growing tendency to drop Gothic flourishes and approach to simplicity and similarity to Roman forms. Incidentally, the present book affords us a glimpse of the decoration and illustration of men like P. E. Colin (a remarkable collection of whose work is housed in the Doucet Library, in the Rue Spontini, Paris), Lucien Pissarro, Franz von Bayros, and Carlègle.

It is a fact worthy of note that, with two exceptions, every illustration or decoration reproduced in the present book is in line. When the now ubiquitous "half-tone" swept over the land we got far away from the old truth that typography is an art of the line and fairly cries for line work in illustrations and decorations as well. Everything in its place; the half-tone is not only a matter of tones, not lines, but it is a reproduction of a wash-drawing or painting. There cannot be established between it and the printed page that harmony that makes a book a finished whole. Such we find it, for example, in the books for which the Englishman Morris or the German Sattler designed type, illustrations, and decorations, and in those for which the services of our own Goodhue and Bradley were enlisted. The early printers, who hit upon a balance of type-space and page-size that has not been improved upon essentially, naturally and inevitably came also to this matter of harmony between type and illustration—because in those days there was only reproduction in line. To bring the necessity of this harmony—and its beauty—vividly before our eyes is not the least merit of the volume under review.

The thin volume "The Late Years of Michelangelo," by William R. Valentiner, is a delight to the hand and the eye. The essay itself is worthy of the fastidiously sober garb with which Mr. F. F. Sherman has invested it. Dr. Valentiner considers especially those carefully finished drawings, particularly the Phæthon and the Resurrection, which are an instructive link between the painting and the sculpture of the master. He comments as well upon the friendship with Vittoria Colonna and the dome of St. Peter's. The essay is notable for its fineness of spirit, sympathy, and insight. Though it is a translation, it reads like an original, and at the same time recalls the best traditions of German literary scholarship as exemplified, for example, by Hermann Grimm. The edition is limited to three hundred copies, and the appeal is equally strong to careful bibliophiles and discerning readers.

Despite the war, *Archiv für Kunstgeschichte* begins auspiciously its second year with the usual twenty plates, drawn mostly from incdited originals in German private collections. Italian examples of note are a late Bacchiacca Madonna, an early Palma Vecchio Holy Family, an important Tintoretto, Christ Bearing the Cross, an odd pastoral scene by Dosso, and a fastidiously delicate Saint Cecilia by Tiepolo. Nothing is more welcome in this quarterly number than a portrait of a severe mathematician and his urchin pupil by Lucidel. Other works of consequence in the northern field are two drastic Passion scenes by Wolf Huber, from the Munich Gallery; three charming panels of the early Cologne school, an Eyckian Resurrection with the Three Maries, closely allied to the famous panel in the Cook collection, and a noble drawing of a Virgin's head by Dürer, lately discovered in a scrapbook of the Museo Civico, Venice. An excellent Poussin and a Rigaud represent the French school. Sculpture claims two plates, a Giovanni della Robbia Madonna, dated 1497, and a contemporary bronze bust of Pope Paul III. Thus this excellent series strengthens its hold upon students everywhere.

Charles R. Morey, of Princeton, publishes with an elaborate commentary twelve color facsimiles of manuscript miniatures in the possession of Charles L. Freer. These are cut from a codex of the "Klimax" and from a Gospels. As a result of Professor Morey's conographical investigations these miniatures are dated in the twelfth century. The Gospel codex is even plausibly traced to a particular convent at Constantinople. Since miniatured manuscripts of this century are pretty rare, these careful color facsimiles with the accompanying discussion constitute a valuable contribution to Byzantine studies. The book is No. 12 of "Humanistic Studies" of the University of Michigan and is to be had of the Macmillans.

If, as Mr. George Wharton James says in his "Indian Blankets and Their Makers" (Chicago: McClurg; $5 net), "there are even thousands of Navajo blankets among the nearly one million dollars' worth made last year by those Indians, which would be the pride of any trained and expert collector, and are as fine as any that were ever produced in the palmy days of the art," why is there not a market for them, and why, as he also notes, are the blankets of the early part of the last century the envy and desire of the collector? The answer is that those blankets which were made from the Spanish flannel, unravelled, with the other colors, black and white, produced from minerals, are preferred by connoisseurs to the modern product of Germantown wool, colored with aniline dyes. Mr. James also goes a little too far in suggesting a comparison between the Navajo blankets and Oriental rugs, wholly unfavorable to the latter. No one, however, can question the author's knowledge of the art he so well promotes. He has evidently studied it long and carefully, and has gathered from tale and tradition the history of the blanket from the earliest days. Nevertheless, when he declares that the art of weaving was introduced to the world by the Navajo woman, he will have to submit better proofs than the legends he gives as evidence. The volume, if its exaggerations be passed over, is interesting and instructive, as an exposition not only of the different weaves, the symbols, patterns, and coloring of the blankets, but also of the life of their makers. The illustrations are many and good, and the greatest value of the volume will be as a book of reference for the collector or the student of ethnology.

Finance

THE STOCK MARKET'S VERDICT.

Resumption by the Stock Exchange, last Saturday, of the open trading in stocks which had been suspended since the Exchange shut down on July 31, has had some remarkable results. Far more than resumption of dealings in investment bonds, a reopened stock market was bound to throw light on certain highly important questions. One, very naturally, was the long-discussed question whether reëstablishment of a broad and active market would start an avalanche of selling, back to New York, of the European holdings of American stocks. This apprehension had considerably waned of late, because of the fact that prices, in the narrow trading elsewhere than on the floor of the Stock Exchange, had held firm at a level above the closing figures of July 30.

But the further interesting question remained for settlement, exactly how the reopened market would "reflect," after the old-time fashion of the Stock Exchange, not only the events which immediately followed the outbreak of the European war, but things which have happened later on. In this intervening four months' period, we have had the reëstablishment of relations on international exchange, the huge accumulations of gold at London and Berlin, and the return of money markets to a perfectly normal basis, in England and in this country. But an open Stock Exchange would also have been called upon to pass judgment on such successive events as the German advance to the Marne, the subsequent retreat, the vicissitudes in Poland, the naval engagements, the Zeppelin scare, the changing position of our cotton trade, the cancellation of the Clearing House loan certificates and the rapid retirement of our emergency bank-note currency, the effective establishment of the new banking system, the Administration's attitude towards "Big Business," and the hopes and doubts regarding the forthcoming railway-rate decision. Regardless of such disputed problems as the presumable volume of European liquidation in our markets, here was a list of "influences," of exceptional weight and interest, whose net result on financial sentiment had to be suddenly measured in the market.

When open trading in stocks began again, last Saturday, "minimum prices" were still enforced by the Stock Exchange; they were in the neighborhood of the closings of July 30. On Saturday, prices of the important stocks rose, on active trading, 1 to 5 points above their latest outside prices. On Monday, further advances of from 2 to 5 points were scored throughout the list, carrying a great part of the market 7 to 13 per cent. above the final July prices. The rise was checked next day, when much of the earlier advance was lost; indeed, Wall Street itself admitted that the pace of recovery was too rapid to continue. Nevertheless, the influence on financial sentiment, of this unexpected action of the reopened stock mar-

ket, was profound. In the light of all experience, it was considered reasonable to look for the early spreading of this new-born hopefulness, from financial markets into the channels of production and general trade.

But what, then, are we to say of the larger economic causes—such as the huge destruction of capital in the war, and the enormous increase in the supply of Government securities on the market—which are still continuing? The Chancellor of the British Exchequer has given one suggestion. The present, Mr. Lloyd George affirmed, "is a period of inflation," when no one need worry over money facilities. He naturally referred to the "emergency currencies" and the "emergency credit" expedients, adopted on a scale without historical precedent in every European market. But he added that, "four or five years hence, we shall probably be face to face with one of the most serious financial situations with which we have ever been confronted."

Not all of Lombard Street's opinion has endorsed this prophecy; but the underlying idea is interesting. It seems to be based on the presumption that two factors, not now present, will be required to bring the true economic test—removal of all these artificial props to currency and credit, and reappearance of demands from industry at large, on the old-time scale, for the world's accumulated capital.

In problems of this sort, it is always the first instinct of careful business men to look for some precedent in the past. It has often enough been pointed out that the Napoleonic war, which began between England and France in 1803 and had spread to the six greater European states by 1805, provides the nearest analogy in circumstances.

But the records of the period give scarcely any clue even to an economic shock in the United States. Not even the American Stock Exchange shut down in 1803; the newspapers of that period give no hint of financial trouble. How little upset was foreign exchange may be judged from the fact that the President's annual message, in the autumn, while referring to Europe's "sanguinary contest," remarked:

> Remittances for the instalments of our foreign debt having been found practicable without loss, it has not been thought expedient to use the power of continuing them by reloans, although no difficulty was found in obtaining that accommodation.

The Treasury at the end of 1803 reported expansion of our commerce, increased receipts from customs, and virtual discontinuance of internal revenue taxation. At the end of 1805 it reported public finances in so flourishing a condition that a handsome part of the public debt was redeemed. "Neutral nations, of whom the United States was chief," an eminent historian of that period relates, "were now absorbing the carrying trade of Europe; American receipts from customs exceeded all former estimates, and were constantly rising."

So that this country, during at least the first three or four years of that prolonged, widespread, and immensely expensive European conflict, seemed to be actually a beneficiary. Yet history further tells us that we had to share in the period of protracted economic inertia, eight or nine years later, after peace had been restored.

Lord Bryce *has written to the editor of* **The Unpopular Review:**

'Tis a long time since I have read anything so good in any review or magazine. . . . To my great satisfaction people here were beginning to appreciate and enjoy it when the storm burst upon us

It is fresh, not hackneyed or conventional, and it is full of thinking, written not because something has to be said, but because the writers have something to say.

Contents for January

The Philosophy of the War—The Expansionist Fallacy—Nietzsche in Action—Parables of the Dramatic Mob—Our Chaotic Divorce Laws—The Passing of the Educated Man—The Cult of St. Vitus—Academe and Mayfair—Feminism and Socialism—What is the Chance for a Job?—The Nation's Adventures in Education—What is a Progressive?—Our Debt to Psychical Research (II)—Ethnic Darwinism. A New-old Fallacy.—En Casserole.

Specimen copies sent subject to return or payment

New War Publications

The Evidence in the Case

An Analysis of the Diplomatic Records Submitted by England, Germany, Russia, and Belgium in the Supreme Court of Civilization, and the Conclusion Deducible as to the Moral Responsibility for the War.

By The Hon. JAMES M. BECK
Late Assistant Attorney-General of the U. S.

In this volume the scholarly author sums up, speaking as a judge in a world's court of absolute impartiality, the causation for the present European War and the relative responsibilities of the nations that are parties to this war. The author's verdict is based upon the official documents in the case, and these documents are presented in the original text as an appendix to the argument.

12mo. $1.00.

Deutschland Über Alles
Or Germany Speaks

A Collection of the Utterances of Representative Germans, Statesmen, Military Leaders, Scholars, and Poets, in Defence of the War Policies of the Fatherland.

Compiled and Analyzed by John Jay Chapman

16mo. *75c.*

In analyzing this series of expressions of German ideals, German standards and German aims, Mr. Chapman reaches the conclusion that a craze or madness has come upon the people, such, for instance, as in 1789 came upon Revolutionary France, and in 1806, in a somewhat different form, came upon the Imperial France.

VOCATIONAL AND MORAL GUIDANCE

By Jesse Buttrick Davis, Principal of the Central High School and Vocational Director, Grand Rapids, Michigan.

This book is the result of several years' experimentation and study of the problems relating to the vocational and moral guidance of young people. Its contents are suggestive of ways and means to meet a few of the perplexing demands that modern conditions are making upon the public schools.

The book recognizes the practical as well as the theoretical aspects of the subject, and outlines actual methods of procedure—with definite suggestions from public-school teachers, librarians, and Y. M. C. A. secretaries who have done the work. *297 pages $1.25.*

GENERAL CHEMISTRY

Principles and Application. By LYMAN C. NEWELL
Professor of Chemistry in Boston University.

This new book excels in directness and simplicity of presentation, in the novel grouping and arrangement of subject matter, and in the compact and luminous treatment of theory. It devotes unusual space to the chemistry of everyday life and the industries. Part I—Descriptive Text. Part II—Experiments. Complete, 580 pages, $1.20.

NOTABLE NEW BOOKS FOR THE HOLIDAYS

From Page's List

AUTHORITATIVE BOOKS ON THE WARRING COUNTRIES

CALIFORNIA, ROMANTIC AND BEAUTIFUL

By GEORGE WHARTON JAMES

"It is written in the optimistic spirit of the true Californian, and it is withal a handsome book, beautifully printed and elaborately illustrated."—*New York Tribune.*

Boxed, net, $3.50; *carriage paid,* $3.75.

THE SPELL OF SPAIN

By KEITH CLARK

As do all of the volumes in the popular "Spell Series," so does this new edition not only describe the attractions of Spain for the traveller, but conveys to the reader the spell of that Arabian Nights' Land.

"It is written with ardor and enthusiasm from a genuine love of Spain and a sympathetic appreciation of her people."—*Chicago News.*

Illustrated, boxed, net, $2.50; *carriage paid,* $2.70.

AMERICAN COMPOSERS

A study of the music of this country, and of its future, with biographies of the leading composers of the present time.

By RUPERT HUGHES, author of "Love Affairs of Great Musicians," etc., and ARTHUR ELSON, author of "A Critical History of Opera," etc.

A new, enlarged, and thoroughly revised edition of Mr. Hughes' successful previous book, "Contemporary American Composers," of which the *Boston Transcript* said: "A popular and valuable addition to the literature of music."

Illustrated, boxed, net, $2.50; *carriage paid,* $2.70.

ANNE OF THE BLOSSOM SHOP

A sequel to "The Blossom Shop"

By ISLA MAY MULLINS

"Fragrant as a field of clover, fresh as a May morning, clear as a dewdrop, chaste as a lily, ANNE OF THE BLOSSOM SHOP comes with its delightful portrait of a Southern girl, whose unfolding and perfecting under the influence of home and friends is a story of compelling interest and refreshing power."—George E. Burlingame in the *Pacific Baptist.*

Third Printing. Illustrated, net, $1.00; *carriage paid,* $1.10.

ON OLD WORLD HIGHWAYS

By THOMAS D. MURPHY, author of "British Highways and Byways from a Motor Car," etc.

A book of motor rambles in France and Germany and the record of a motor pilgrimage from Land's End to John O'Groats in Great Britain.

"Mr. Murphy's style is charming, his information varied, his knowledge of things classic and picturesque, broad and scholarly."—*New York Sun.*

Illustrated with sixteen full page plates in color and forty in duogravure. Boxed, net, $3.00; *carriage paid,* $3.20.

THE SPELL OF JAPAN

By ISABEL ANDERSON (Mrs. Larz Anderson)

"Mrs. Anderson's book cannot fail to serve as a new and important tie of friendship between the United States and Japan. It could not have breathed a more conciliatory and friendly spirit, and its simple and engaging style cannot fail to win golden opinions for its talented author."—Nathan Haskell Dole.

Illustrated, boxed, net, $2.50; *carriage paid,* $2.70.

BULGARIA AND HER PEOPLE

Including an account of Bulgaria's relations with Servia and Montenegro.

By PROF. WILL S. MONROE, author of "Bohemia and the Cechs."

"In these days of European war the reader can find much that is of thrilling interest from the calmly written facts relating to the late Balkan War, and its more or less close connection with the great conflict that is now before us. This concise and graphic history of a people who have known little of life's pleasures, but always plenty of the hardships, is written with a dignity befitting the subject."—*Travel.*

Handsomely illustrated, boxed, net, $3.00; *carriage paid,* $3.25.

THE RUSSIAN EMPIRE OF TODAY AND YESTERDAY

By NEVIN O. WINTER

"Mr. Winter has travelled everywhere in Russia and has read about everything that has been written about the people, and gives in this book the cream of the twentieth century about Russia. The book will make a valuable addition to any library and will be an authority on Russia for many years."—*Christian News.*

Illustrated, boxed, net, $3.00; *carriage paid,* $3.20.

POLAND OF TODAY AND YESTERDAY

By NEVIN O. WINTER

"This is a high-class book and it gives complete and exceedingly valuable information about Poland and the Polish people. Such a work represents inexhaustible research and labor and as an addition to the library of the scholar it is without a rival in respect to the subject."—*Boston Herald.*

Illustrated, boxed, net, $3.00; *carriage paid,* $3.20.

THE MESSAGE

By A. J. DAWSON

A remarkable story in which the author forecasts with almost prophetic exactness the Titanic struggle now being enacted in the war caldron of Europe. The plot of the story involves a German invasion of England, with the capture of London.

Illustrated, decorative, jacket, $1.50.

SYLVIA'S EXPERIMENT

The CHEERFUL Book

(Trade 3rd Printing Mark)

The story of an unrelated family

By MARGARET R. PIPER

"Kindliness and forethought for others form the keynote of this delightful book for folk of all ages—an ideal holiday story."—*New York Sun.*

Net, $1.25; *carriage paid,* $1.40.

POLLYANNA

The GLAD Book

(Trade Mark)

CALENDAR

Compiled by ELEANOR H. PORTER, author of "Pollyanna, The Glad Book."

Artistically decorated and printed in colors. Handsomely boxed, net, $1.00; *carriage paid,* $1.10.

THE WORST EDITION OF SHAKESPEARE.....*Charles S. Brooks*
ACADEMIC SUPERSTITION AND DEMOCRACY.....*Florence V. Keys*
and SIGNED BOOK REVIEWS BY WELL KNOWN AUTHORITIES

THE YALE REVIEW IN 1915

will publish a series of articles designed for readers who have kept pace with events of the war through the newspapers, and desire mature and vigorous discussion of what has happened, why it has happened, and how. The war, however, will not interfere with the REVIEW's established policy of supplying the best general reading available in a periodical publication. Criticism of contemporary literature and contemporary literary movements of a quality not common in recent years in America, which was brilliantly inaugurated in 1914 by ROBERT HERRICK and BLISS PERRY, will be continued with equally notable articles in many other fields.

SPECIAL INTRODUCTORY OFFER

To introduce the YALE REVIEW to those persons who wish to read the best articles procurable on public questions, art, science, history, and literature, we will send complimentary the January number with one year's subscription beginning with the April number.

$2.50 a year ***75 cents a copy***

BOOKS OF THE WEEK 757

THE MARY CARLETON NARRATIVES
1663-1673
A MISSING CHAPTER IN THE HISTORY OF THE ENGLISH NOVEL.
By **ERNEST BERNBAUM**, Ph.D.,
Instructor in English in Harvard University.
8vo. *Cloth, with paper label.* 106 *pages.* $1.00 *net.*
The career of the once famous adventuress, Mary Carleton, is not without lively human interest in itself; but the especial value of this study lies in its disclosure that a narrative which for 250 years has been thought a biography is in reality a novel. The ingenious devices sustaining the imposture are shown to be the outgrowth of seventeenth-century journalism, and to anticipate the methods of Daniel Defoe—thus exploding the accepted doctrine that in the Restoration no serious realistic fiction was written.

A Beautiful Art Gift Book

BERNINI

AND OTHER STUDIES IN THE HISTORY OF ART

By RICHARD NORTON

Museum of Fine Arts, Boston

This noteworthy book is the product of deep thought. The little-known sketches of Bernini, showing the development in his mind of the design for the Piazza of St. Peter's, and the sculptor's models wrought by his own hands are fully reproduced. Of great service to the reader also are the typical examples, many hitherto unpublished, which illustrate the main points of the different studies. This volume is probably the most attractive art-book published this season.

Illustrated with sixty-nine plates

Cloth. Quarto. $5.00 net

THE ALGEBRA OF LOGIC

By LOUIS COUTURAT

Authorized translation by LYDIA G. ROBINSON, with preface by PHILIP E. B. JOURDAIN. Pp. 41, 8vo; cloth. An introduction to the study of mathematical logic. Price, $1.50.

One of the simplest and most concise treatments of the subject of symbolic logic. The preface is of an historical character and gives a very thorough account of the development of the subject and the various phases of it, especially emphasized by each of its different representatives.

THE EAST I KNOW

By PAUL CLAUDEL

Translated by Teresa Frances and William Rose Benet

No less a critic than William S. Braithwaite lists this book at the head of the "Ten Best Books of Poetry for 1914," describing it as: "A volume of prose poems by one of the greatest poets living in the world to-day. Although Paul Claudel is unknown to English readers, his influence is the strongest shaping force there is on the young poetry of most European countries. I know of no living writer of whom we may more confidently predict immortality for his work. If any reader can set down this volume without realizing that a great new force in literature and life has been born into the world, he is incapable of imaginative appreciation."

The book is well suited for use as a gift.

The Nation

NEW YORK, THURSDAY, DECEMBER 24, 1914.

Summary of the News

An Interesting political development of the week, and one that has been somewhat neglected, was the meeting at Malmoe, Sweden, on Friday and Saturday of last week, of the Kings of Sweden, Norway, and Denmark. This was the first occasion on which the monarchs of the two former countries had met since the separation—a model of bloodless revolution—of Norway and Sweden in 1905, and the incident undoubtedly marks the establishment of closer relations between those two nations. That aspect of the conference, however, is only of secondary interest. Its real significance is in relation to the present struggle and in connection with the persistent and well authenticated reports of German wooing of the Scandinavian countries, especially of Sweden. The result of the meeting seems to have given no encouragement to any hopes that Germany may have entertained of involving her northern neighbors in the war on her side. A full agreement, it is stated, was reached concerning the neutrality of Sweden, Norway, and Denmark, and the principal object of the conference was to agree on uniformity of action to safeguard their common interests in the more difficult questions arising out of the war, principally in connection with Scandinavian shipping. According to dispatches from Petrograd to the New York *Times*, the meeting is viewed there with approval as foreshadowing an alliance of the three countries which shall lead to a declaration of permanent neutrality both for the states themselves and for the straits uniting the Baltic with the North Sea and the Atlantic.

A development of the utmost importance in the situation in the Balkan states was the announcement of the Bulgarian Minister at Petrograd on Tuesday that an agreement had been reached between Rumania and Bulgaria under which Rumania would restore to Bulgaria the province of Dobrudja and most of the other territory which she acquired from Bulgaria as a result of the second Balkan war. At the same time the Bulgarian Minister announced that his country would continue to be neutral, and expressed the belief that Rumania, "although she has no cause to fear us," would do the same The importance of this announcement is that it sets at rest all doubts as to the intentions of Bulgaria, and disposes of a possible source of danger to the Allies. The way to Western Europe is now definitely closed to the troops of the Sultan. Irrespective of any action with regard to the war that may be taken by Rumania or Greece, Bulgaria will remain neutral. Whether the announcement portends a change of attitude on the part of Rumania and her approaching participation in the war is not so clear. If she is determined to satisfy her Transylvanian aspirations by force of arms, she is at liberty to do so so far as Bulgaria is concerned. At any rate it may be taken for granted that her surrender of the newly acquired province is not dictated by motives of pure philanthropy, and it is possible that she has received from the Allies the promise of a *quid pro quo* when the time comes for the division of the Austrian spoils. The suggestion is obvious, however, that that time, if it is to come at all, might be appreciably hastened were Rumania to join the Allies.

The vote in the House on Tuesday on the Prohibition Amendment was 197 for the resolution to 189 against, 61 votes short of the two-thirds majority required.

In the Federal District Court on Monday Judge Hough dismissed the equity suit brought by the Government under the Sherman law against the Lehigh Valley Railroad Company on account of its relations with the Lehigh Valley Coal Company, the Lehigh Valley Coal Sales Company, and a number of similar concerns.

Increases in freight rates approximating 5 per cent. on all the railways between the Atlantic seaboard and the Mississippi north of the Potomac and Ohio Rivers were granted on December 18 by the Interstate Commerce Commission, two Commissioners dissenting from the opinion of the majority.

In response to Col. Goethals's request that ships of the navy be sent to the Panama Canal to prevent violations of neutrality, Secretary of the Navy Daniels last week ordered the cruiser Tacoma to proceed to Colon. Col. Goethals's request seems to have been made almost entirely as a precautionary measure, as he stated in a message to Secretary Garrison on December 17 that "excepting for reports of the misuse of wireless, no neutrality is known to have been violated."

In Mexico, the position of Carranza appears to grow more precarious. The State Department on Monday received news from Vera Cruz that his force of some 20,000 men was severely defeated at Apizaco and Puebla by a Conventionist army under the command of Zapata and Angeles. According to information received by the State Department from its agents in Mexico, Puebla, Apizaco, Pachuca, and Guadalajara have all fallen into the hands of the Conventionists. A situation of some difficulty arose last week as a result of the fighting between the Mexican factions at Naco, in which shots were freely fired over the border into United States territory. The garrison of Gen. Bliss, in command at Naco, has been reinforced by some 4 000 men, and, according to the latest intelligence as we write, Gen. Maytorena has withdrawn his troops further from the border.

A British Protectorate was formally proclaimed throughout Egypt on December 18, thus reconciling the form of British rule in Egypt with what has been the fact for the past thirty-two years, and marking the end of Turkish power in Africa. Prince Hussein Kemal Pasha, an uncle of the ex-Khedive, who has thrown in his lot with the Sultan, was installed as Khedive on the following day. Incidentally it is interesting to note that this action by Great Britain brings to an end a curious anomaly in her imperial administration. Hitherto her representative in Egypt, the most powerful of her pro-consuls, has borne the modest title of "British Agent." In the proclamation of the Protectorate Lieut.-Col. Sir Arthur Henry McMahon is appointed to be "his Majesty's High Commissioner for Egypt."

Relations between Greece and Turkey were subjected to a further strain last week by the arrest and condemnation to death in Constantinople of a warrant officer attached to the Greek Naval Attaché. A strong protest was made by the Greek Minister, and it is understood that Germany has brought pressure to bear on her ally to have the sentence revoked.

The Italian Senate adjourned on December 18, after giving evidence of complete accord with the neutral policy of the Government. In a speech before the adjournment Signor Salandra, according to cabled dispatches, coupled an expression of hope that peace might be reëstablished in 1915 with the significant statement that he expected that next year would add to Italy's glory and greatness, an end which would be accomplished owing to "the unity of the people and the strength of the army." On the same day King Victor Emmanuel signed a royal decree authorizing the issuance of a loan of $200,000,000, bearing interest at 4½ per cent., and repayable within twenty-five years. The difficulty that arose between Italy and Turkey over the Hodeida incident, which we noted last week, has not, as we write, been settled. The Ottoman Government has agreed to concede all of Italy's demands, but the authorities at Hodeida have not so far complied with the stipulations, and it was reported on Monday that Italy had sent a more peremptory note, demanding immediate satisfaction.

The Appropriations Committee of the French Chamber has had under consideration the budget for 1915, which provides for a monthly expenditure on the war of about $200,000,000 during the first six months of next year, a sum roughly equal to that which is expended by England. Speaking before the Appropriations Committee on Friday of last week, M. Ribot, Minister of Finance, emphasized the strong financial position of France, and declared that the nation would not be embarrassed by a prolongation of hostilities. The most important item in the budget is the Government's request for authorization to issue Treasury bonds up to $400.000,000, with authority, if necessity should arise, to go beyond this maximum by decree after consulting the Council of State. The French Parliament reopened its sessions on Tuesday.

The deaths of the week include: Johannes Bernardus Blommers, Col. Edward D. Meier, December 15; Dr. Winfield S. Smith, December 16; Charles R. Rutan, Brig.-Gen. John Vincent Furey, Daniel Parish, December 17; Archibald Ross Colquhoun, December 18; Eugene Zimmerman, Brig.-Gen. Charles Norton, December 20; Brig.-Gen. John Beatty, Richard J. Evans, December 21.

The Week

"We now let these Belgian documents speak for themselves" is the concluding sentence of Dr. Dernburg's plea in justification of Germany's violation of her treaty obligations. And they *do* speak for themselves; but they do not speak for Dernburg. That gentleman, in the course of his 1,500 words, more or less, of introduction, has not a word to spare for the simple fact that the military arrangements discussed between a representative of the British army and a representative of the Belgian army related solely to what would be done "in case Belgium should be attacked." Special pleading, on the part of the official advocates of any belligerent, is to be expected; but there are limits beyond which special pleading becomes an insult to intelligence. Those limits are passed when the consideration of measures to be taken by one country in case a treaty is violated by another is deliberately declared to be proof that the first country herself was determined to commit the violation. And on no better basis than this does Dr. Dernburg rest the defence of Germany's crime against Belgium.

Two extremely interesting facts stand out from the record of Admiral von Spee's ships and from that of the Emden. It was believed before this war that a commerce-destroyer would have the greatest difficulty in getting coal if it did not belong to a nation with coaling-stations throughout the world. But these German vessels had no difficulty whatever in coaling. What troubled them was their inability to obtain ammunition. It is reported that the Gneisenau had shot away all her ammunition some time before the end came; and the Scharnhorst could not have been much better off, for the two bore the brunt of the action off Coronel. From the official report of the gallant captain of the Emden to the Kaiser, it appears that he, too, ran out of ammunition. He then actually turned his vessel towards her pursuer, in the hope of sinking the latter with a torpedo or by ramming her, but in a few minutes his funnels were shot away, his steam fell off, and there was nothing left but to run the ship on a near-by reef. The deadliness of these modern battles for the loser appears not only from the fact that, like the Monmouth and the Good Hope, the Gneisenau went down with all on board, but from the official statement that, while about 110 men were killed on the Emden, only eight were wounded. The knowledge that scarcely a single German vessel has thus far surrendered under fire, and that the crews have chosen to perish rather than haul down their flag, as did the men of the Gneisenau, is producing a tremendous feeling of pride and elation in Germany, where they consider that their navy of only thirty years' standing has proved itself the equal of the British in ability, daring, and a courage which welcomes death for the Fatherland.

Sufficient information has now come to hand about the naval battle off the Falkland Islands to make it clear that it was as accidental as was the action off Coronel. On the latter occasion the two fleets knew that they were in the same waters, but were not aware how close they were to each other, for the British admiral had not waited for his one battleship to join him. Moreover, they met only an hour before sunset. Had either fleet been slightly delayed, the battle would not have occurred. Off the Falklands, Admiral von Spee apparently had no idea that the British reinforcements had arrived. He was looking for the Canopus, the one British battleship he knew to be about, and when his scouts reported her and some cruisers, he went after her, only to find himself in a hornet's nest. Then he boldly decided to attempt to save his light cruisers for further raiding by sacrificing his own ship, the Scharnhorst, and his other armored cruiser, the Gneisenau. In this he was only partially successful, the Dresden alone escaping. Thus there is no tactical or strategical lesson to be drawn from either battle. Von Spee is still entitled to the highest praise for getting his ships together by wireless, and for his skilful handling of them when they met the British cruisers. It is presumed that he was heading for the South Atlantic, which would seem to have been quite the proper course, when he fell into the British trap. A dash for the English coast, destroying merchantmen as he went, and an effort to reach home waters by way of the North of England would seem to have been as useful a plan as any he could have adopted.

That the "Finis Finlandiæ" so often spoken of by Russian reactionaries should be planned anew at this time of Allied battle for small nations has naturally alarmed English sentiment. The publication by the Russo-Finnish Committee—a body composed of high officials, working with the sanction of the Czar—of a programme of legislative measures for Finland, has been taken by some as purely academic; but others will not dismiss it so lightly. The programme is the result of many years' work; it gives practical form, moreover, to some of the more general measures passed by the third Duma in 1910 to restrict Finnish liberties. According to a Danish correspondent of the London *Nation*, its "adoption *en bloc* when laid by the Czar's Ministers before the present Duma is a foregone conclusion, a mere matter of form." By it the laws regarding the Russian press, societies, and meetings are to be extended to Finland; all officials are to be removable by Russian authorities; all schools and the Helsingfors University are to be placed under the Petrograd Ministry of Education; and preference for Russian goods is to be established. The Russian author, M. Lebedeff, takes the more hopeful view that the Duma, more liberal than in 1910, will reject the legislation. But there is no doubt of its submission, and this fact alone is disturbing at a moment when it was beginning to be hoped that the war promised to better Russian governmental policy.

Though the shrinking of Magna Charta in time of war is to be expected, King John's ghost must have found a grim satisfaction in the recent debate in the House of Lords on the Defence of the Realm Act. Incidentally, the fight waged illustrates what the upper House gained in the accession of Viscount Bryce. The new act would give to a court-martial the power to execute a British subject, whether in military or naval employ or not. With men like Bryce, Lord Loreburn, and ex-Chancellor Halsbury on the floor, the debate quickly became a grave discussion of Constitutional principles. No reason was shown by the Government why the ordinary courts were not sufficient for all present purposes; and the upshot was an agreement postponing the operation of this part of the act until Parliament reassembles. To another section giving the authorities the right to take over property no objection was interposed. It may obviously be necessary for the military at any time to take possession of the land, destroy buildings, and remove the population. The matter is one quite different from resorting to military courts for civilian trial. No outwardly plausible reason will induce Englishmen to surrender on such a principle; and it is strange that the Commons waived a point contested by the Lords.

A dispatch from Cape Town states that Gen. Botha has gone to his farm for a short vacation, the rebellion being, in his judgment, practically at an end. It did not re-

quire this announcement to satisfy the world at large that the troubles of the British Government in that direction were over. The original insurrection, that led by Col. Maritz, collapsed at once; but for a short time it seemed not impossible that the later movement, headed by Gen. Beyers and Gen. De Wet, might prove formidable. Such did not, however, prove to be the case; and when, before long, these leaders were removed, the one by death and the other by capture, it was evident that the affair was virtually disposed of. The Germans' hopes of troubles for Britain from disaffected Boers, East Indians, Egyptians, and Irishmen thus seem destined alike to complete disappointment. In the case of the Boers, this exemption is clearly to be ascribed to the broad-minded policy, probably without a parallel in like circumstances, adopted by the British Liberal Government soon after the war; and it is natural to ask the question whether the strong-arm policy in Egypt so confidently urged upon England by Col. Roosevelt on the occasion of his visit four years ago would not have had the effect of making her situation in the land of the Nile very different from what it is at the present juncture.

Chairman Hilles does but his duty when he predicts a sweeping victory for the Republicans in 1916. One of the responsibilities of his position is deciding just when to prophesy. But he is not well advised in going into details, such as naming the issue. Not all of the members of his party are certain that they want it to be the tariff. Who is the great tariff protagonist now? One Boies Penrose, of tariff-devoted Pennsylvania. Would Mr. Hilles regard without secret uneasiness the nomination of the Senator for President? Or has he forgotten the train of events that followed the last attempt of his party to revise the tariff? Would he like to live over the time when Republicans in House and Senate were craftily urged by their opponents to say in intelligible language whether revision meant revision up or revision down? More cautious Republicans will hope that the ghost of the Payne-Aldrich bill may not be conjured up quite yet, and will deem it wiser to watch and pray for a less dangerous issue, like hard times. It is still some distance to the next Presidential campaign, and who knows what may develop by then? A year from now we may be in the midst of a discussion of the powers of the Federal Trade Commission, of President Wilson's part in arranging an armistice among the European Powers.

Everybody takes a shot at the dying Bull Moose. Now it is the unfeeling Democratic majority in the House, which, unmindful of the service rendered the party in the battle of 1912 by the deserting Progressives, cuts off an allowance of $1,800 a year heretofore made for an official representative of the Progressives in the organization of the House. The excuse for this action is the President's call for economy. What more tempting economy can there be than economy at the expense of another party? But the Democrats are able to point to a solid fact in support of this step; this is that the present representation of the Progressives, who number seventeen, will be reduced to seven after the fourth of March, owing to the tragedy of the November elections. And among these seven will appear neither Congressman Murdock, their present leader, nor Congressman Hinebaugh, first lieutenant. Why continue an appropriation of $1,800 a year for a set of nobodies? So far have we come from the sanguine days of 1912! There was a song in those days that the Progressives, who, at all events, are good at singing, must feel like making their own. Its refrain was: "You gotta quit kickin' my dawg aroun'."

Judge Hough's decision in the Government suit against the Lehigh Valley and its affiliated companies for violation of the Anti-Trust law and the "commodities clause" of the Hepburn act, is chiefly interesting for its view of what is or is not proper reorganization of a company in order to conform with the law. The Lehigh Valley Railroad, in divesting itself of its previous control of the marketing of coal produced along its line, formed a separate Coal Sales Company, the stock in which it offered for subscription to its own shareholders. The Government asserted that this form of dissolution was evasion of the law. Judge Hough finds that the law has been properly observed, provided the separation of the two branches of the industry has been carried out in good faith, and he holds that no evidence to the contrary is presented. Precisely the same conclusion was reached by the New Jersey District Court last April, in the suit to prove illegal the Lackawanna's similar method of separating its transportation and coal-marketing business.

The American Association for Labor Legislation is to hold its annual meeting at Philadelphia, on December 28 and 29. A special notice sent out by the Secretary speaks of "the backwardness of Pennsylvania in protecting her more than a million industrial workers" as having "long been regarded as a serious obstacle to progress in other States." But on the other hand, turning to the printed programme of the meeting, we find that one of the leading papers on the subject is to be on the "Proposed Workmen's Compensation Law for Pennsylvania," while another is on "The Operation of the New York Workmen's Compensation Law." To the former title is attached a note saying that "Pennsylvania is to be the last of the principal industrial States to pass a compensation measure; all political parties are pledged to its enactment in 1915." And under the latter title the remark is made that "the New York compulsory compensation law, which went into effect on July 1, 1914, has attracted much attention as the most liberal American law." It thus appears—as indeed we all know—that, however regrettable the backwardness of Pennsylvania, it was not enough of an obstacle to prevent her biggest and nearest sister State from adopting a law of the most liberal kind; and furthermore that Pennsylvania herself is sure to fall in line very soon. Such facts as these show how impotent are the stock objections against action by separate States to stop a social or industrial reform when its justice and practicability have once become clearly recognized.

When we find an address opening with a reference to the appalling inhumanity and waste of the war in Europe, followed by the remark that "we rarely stop to think that an equally disastrous and perhaps even more shameful war is going on in our midst all the time," we are prepared for a reformatory thriller of the first order. But such is not at all the character of the address made by President Maclaurin, of the Massachusetts Institute of Technology, to which we are referring. Speaking before the Boston Safety Society last week, he tried to impress upon his hearers the enormous extent of the suffering and loss caused by avoidable industrial accidents in this country; but, while insisting on the duty of doing everything that can be done to reduce the evil, he dwelt particularly upon one aspect of the question which is too generally lost sight of. This is the cardinal importance of what can be accomplished by voluntary effort, if sufficiently stimulated by a knowledge of its possibilities. Dr. Maclaurin speaks of instances in which corporations have reduced accidents to their workmen by one-third in a single year, by two-thirds in ten years, "and some," he says, "have very nearly eliminat-

ed them altogether." But it is not wholly, nor even chiefly, by the employers that the lesson needs to be learned; it is the workmen themselves, above all, according to Dr. Maclaurin, who must learn to mend their ways. In Germany, he says, statistics show that "there are about twice as many accidents that happen through the carelessness of the workmen as through the neglect of proper safeguards on the part of the employer"; and in this country he thinks it probable "that the proportion to be ascribed to the workmen is even larger than it is abroad."

An illustration of the kind of thing that needs to be done for the improvement of judicial procedure in this country is furnished by the work of a committee, representing both law and medicine, which has been considering the question of reform in the matter of expert medical testimony. To a very large extent, the scandalous experiences which have been so frequent in this regard have been due to want of ability or vigor on the part of judges; but much, too, is to be ascribed to the rules of procedure. The committee referred to, which includes in its membership Judge Barnes of Chicago, Professor Mikell of the University of Pennsylvania Law School, Dr. Adolph Mayer of Johns Hopkins, and Dr. Morton Prince of Boston, has made several important recommendations, which are summarized by the *Illinois Law Review*. Without entering into details, it may suffice to say that each of them is directed towards the simple and obvious desideratum of giving to the determination of the question of sanity as much of the character of a straightforward and scientific inquiry as is compatible with the preservation of fundamental legal rights.

The Census Bureau's report on the insane under institutional care in the United States shows a continuance of that steady increase in their number (and their ratio to the total population) which has so long been familiar. To what extent, or whether at all, this increase means a real increase in the frequency of insanity appears still to be an open question among careful statisticians; for the report draws attention to an influence which was long ago recognized as going far to account for the figures—the extension of institutional provision for the care of the insane, and the growth of the practice of making use of such provision. That these factors are still operative in an important degree is evidently the opinion of the census authorities. Another question which, one would think, deserves careful inquiry, is that of age-distribution; for it is not impossible that the change that is gradually taking place in this regard may have much to do with the matter. Finally, a distinction of no small importance is that between a merely arithmetical increase of frequency and such an increase as signifies worse conditions or habits of life. To whatever extent the augmentation may be due to the saving of the lives of persons more than normally liable to mental disease, to that extent it is not to be regarded as indicating a decline in the general well-being.

The "orphan-asylum Indian," whom Secretary Lane has deprecated, can most quickly be brought to independence by industrial education; and Commissioner Sells's supplementary report shows how much is being accomplished along this line by the unusually large appropriation which he was able this year to obtain. Schools are being established with the primary end of fitting the Indian for agriculture and trades; demonstration agents have been appointed to improve methods of farming; and cattle-raising has been started in Oklahoma on a new scale by a joint use of Indian and Government funds. It is the statement of Secretary Lane that the United States has spent a total of $10,000,000 in irrigating Indian lands, and that most of it has been sheer waste because the tribesmen were ignorant of irrigation farming! If the Secretary's and Commissioner's reports together show a new energy in dealing with the nation's 300,000 protégés, their insistence on preparation for citizenship indicates that their zeal is foresighted. Mr. Sells announces a new plan of sending three representatives to spend their time on the reservations investigating and reporting on Indians ready for absorption—an improvement upon the old system of letting the Indian himself apply for citizenship; and Mr. Lane states that, with his Alaskan and Western land legislation virtually assured, the preoccupation of the Department will this year be with the development of the Indian.

John Lind's second instalment of "The Mexican People" in the *Bellman* speaks well of the Mexicans not merely in their general character, but in their attitude towards Americans. "It has been difficult for the Mexican people to believe that our President did not have some ulterior motive in his proffered assistance and good offices. I think, however, that they are now nearly convinced; and when once convinced, . . . more loyal friends are not to be found." Again: "You have heard a great deal about the hostility of the Mexicans for everything American. I found no such hostility except among the class who supported Huerta. They hated us. What there is left of them hate us now. They do not hate us as individuals. They hate and dread the influence of our institutions." The Mexicans of the North, who are, Mr. Lind thinks, to dominate the future, "like us as well as any foreign people can like another." He does not reason as if the Mexicans are a brutish and ignorant race, whom only the big stick can terrify into proper respect. His own opinion is that there is a considerable intellectual class in Mexico, and that the masses are illiterate rather than ignorant. The practical workings of the President's policy may have been disappointing; but Mr. Lind contends that the spirit of good-will in which it was conceived will slowly make an impression, and be reciprocated.

Parallels implying comparisons are doubtless odious, yet there may be profit in setting side by side "Der Tag" of the chief of the kailyarders and such a dialogue as Landor's between Alexander and the Priest of Hammon. The grounds on which Landor excoriates the earlier fighting king are much those on which Barrie tries the Kaiser. Substitute references to Belgium and culture for Alexander's boast that the ruler of Macedon had demonstrated his regard for religion by slaying nine thousand of its Grecian enemies, and the variation of the Priest's rejoinder would be easy: "William! William! the enemies of culture are the cruel, and not the sufferers by cruelty." Between Thebes and Louvain is no faint analogy. To the Priest, a hound on a heap of dust may dream of a fine city:

> But to destroy them is the very foremost of the excesses I abhor. All the cities of the earth should rise up against the man who ruins one. Until this sentiment is predominant, the peaceful can have no protection, the virtuous no encouragement, the brave no countenance, the prosperous no security. We priests communicate with one another extensively; and even in these solitudes, thy exploits against Thebes have reached and shocked us.

The dream in which the Kaiser loses his sense of time is not so fine a reminder of the perspective of the centuries as a single sentence of the Priest's when Alexander complains that dust from the temple door has blown into his eyes: "Of that dust are the sands of the desert and the kings of Macedon."

NAVAL BOMBARDMENT OF OPEN TOWNS.

The uncertainty which still enwraps the technical right, under international law, to bombard from the sea unfortified coast towns is seen in the war dispatches. From Berlin on Saturday it was stated that, while the German Government feels that it is "entitled" to shell undefended towns, there is a difference of opinion about it in the Navy. Some officers think it is not to the honor of the fleet; more believe that it is a mistaken policy. The net impression is that raids like last week's upon the English coast will be repeated, if occasion offers. They certainly will not be headed off by the angry words which Winston Churchill, of the British Admiralty, applies to them. His attitude will, if anything, encourage the Germans to keep on raiding. And they may point out that, while he waspishly denounces the action of the German cruisers, he does not say that English warships will not do the same thing, if they get a chance.

This, however, would be unfair. England has officially gone on record against the German practice. In the instructions of the British delegates to the Hague Congress of 1907 we read: "The Government consider that the objection, on humanitarian grounds, to the bombardment of unfortified towns is too strong to justify a resort to that measure, even though it may be permissible under the abstract doctrines of international law." This was a clear departure from the view held and proclaimed by the British Admiralty earlier. In the naval manœuvres of 1888, the "enemy squadron" was supposed to ravage the coast of Scotland. It was reported as destroying Greenock, "blowing down" Adrossan, and "shelling the fine marine residences and watering-places in the Vale of the Clyde." Instant protest against such practices was made by T. E. Holland, professor of international law at Oxford. In a letter to the London *Times* he denounced them as "Naval Atrocities," and declared it a most urgent question whether the British Navy was to be allowed to think that it could conduct uncivilized warfare. Professor Holland's protest at once provoked counter-protests from naval officers. One of them wrote to the *Times* that, in a great war, "not the slightest respect would be paid to old-fashioned treaties, protocols, or other diplomatic documents." Here was the English version of the scrap of paper! Capt. James of the fleet begged to inform Professor Holland that "the talk about international law is all nonsense." These were only individual opinions. But a committee of admirals was appointed to report, among other questions, on "the feasibility and expediency of cruisers making raids on an enemy's coasts and unprotected towns for the purpose of levying contributions." Their conclusion was that "there can be no doubt about the feasibility of such operations"; that they would surely be attempted by "any Power at war with Great Britain"; and that "we know of no means more efficacious for making an enemy feel the pinch of war."

All these facts are set forth in Professor Holland's "Letters on War and Neutrality," a new edition of which was issued only this year. His position in the matter of naval bombardment of unfortified towns was that international law did not prohibit it, but did restrict it. And he raised his voice most humanely and eloquently against the supposition that, because the rules of naval war, narrowly interpreted, might permit the doing of barbarous deeds, therefore barbarous deeds could be both done and exulted in. Professor Holland uttered one warning which comes home with special force at the present time. He affirmed that England ought to be told to what risks her seaboard towns might be exposed in time of war, and pointed out the folly of allowing, in "mimic warfare," "any course of action which could be cited against us in case we should ever have to complain of similar action on the part of a real enemy."

To what purpose recall these things today? For the purpose of pointing out that the "war party" in all countries is essentially the same. It has existed in Great Britain and in the United States, just as it has in Germany. In all it has had the same characteristics: reckoning everything in terms of powder and shot; impatience at restraint by any "sentimental" considerations; eagerness to be always ready to "strike," and to strike first; a constant desire to make a whole people think night and day of preparations for war and conquest. But in our own country and, measurably, in England it has been held in abeyance. Compulsory military service has not been tolerated. The plans of war experts, who, if they had their way, would compel us to maintain a garrison in the planet Jupiter, and to sail battleships along the Milky Way, have been kept under control. To obey the law and to live in peace has been thought better policy than to snap one's fingers at treaties and plunge into war. The British Government has not been exempt from rash counsels by heady men whose thoughts are all of war. It has been stated on good authority that Winston Churchill was anxious to "smash the German fleet," a week before war was declared, but that the Cabinet sat down hard on him. There are always preachers of might and ruthlessness. Every nation has its gospellers of blood and iron. But the nation that strives to keep its civilization unpoisoned will not ask what can be done, but what ought to be done, and even in war will have a decent respect for the opinion of mankind.

THE WAR AND "ECONOMIC EXHAUSTION."

The absence of any sensational readjustment in the world of investment capital, at a time when the temporary borrowings of the belligerent European states are being replaced by long-term war loans of wholly unprecedented magnitude, has been a subject of much comment. The entire episode is providing a new and remarkable study in economics on the grand scale—not less so, when so few of the seemingly unavoidable immediate economic consequences are happening as had been expected. Germany on September 19 offered a war loan of $1,100,000,000. It was offered at 97½, and bore interest of 5 per cent.—not, perhaps, a remarkably high bid for capital, when it is remembered how relatively high a rate the Empire has lately had to pay for loans, even in time of peace. It was oversubscribed in Germany.

Dr. Helfferich, of the Deutsche Bank, in a monograph on this loan declared that "there is no parallel in history for our war loan, and it will be no easy matter for any country on the globe to equal it." The Imperial loan was, in fact, greater by $275,000,000 than the famous French indemnity loan of 1872, previously the largest single operation of the kind on record; and the German loan was subscribed in Germany alone, whereas the whole financial world had a hand in the loan of 1872. But the British Government's answer to the Berlin bank director's challenge was the successful offer, on November 17, of a loan for $1,750,000,000, or more than half as large again as the German operation. The interest rate was 3½ per cent. and the price 95, which yielded the investor not much more than do the existing 2½ per cent. consols, at present prices. And we are beginning to hear of another huge loan by Germany.

That this huge displacement of capital, present and prospective, does not more seriously upset the investment market generally has been a matter of great surprise. The immense facilities for credit established in all European markets under Government auspices, when the war broke out, explain this

to some extent. No doubt, the real effects will be felt much later on—perhaps when the present facilities of "emergency credit" begin to be withdrawn. Possibly, also, it may be said that a successful billion-dollar or two-billion-dollar war loan, at a time when suspension of trade activity has released immense supplies of capital, is no more remarkable than the "flotation" of the billion-dollar Steel Corporation in 1901, when promotion and investment were on a scale of feverish activity. But as the war goes on, the providing of the fifty-odd million dollars daily for the expenses of the combatants is sure to develop new and interesting precedents in the field of political economy.

What has already happened throws some light on the favorite theory of "economic exhaustion" as a result of war. Nothing can be more convincingly reasoned out as an inevitable consequence, yet nothing is harder to prove by historical precedent. We can, in fact, recall but one instance in the great wars of the past two centuries in which a combatant had to lay down its arms because of such exhaustion. But the Southern Confederacy of 1865 was in a position where the supplies of its armies were literally cut off by superior forces. Lee had lost access to his own country's farms and storehouses. It was no longer a question even of money or credit, but of food.

It must be frankly admitted that the present war is creating situations new to history, in this regard as in others. With Germany or France, for example, it is a case of withdrawing from production, for an indefinite period, the greater part of the able-bodied male citizenship, and turning them into consumers. And in Germany this happens when the nation is cut off from access to the outside producing world. What is to be the end of that process? The question is not, as with the Confederacy, what will happen to the army, but what will happen to the nation. It is doubtful if the question has ever been really tested in our time. Prof. Roland G. Usher, in the December *Atlantic*, has an ingenious theory. It is, that every German not in the ranks has been catalogued in advance by the Government, and is shifted by governmental mandate from one selected field of industry to another; that production and consumption, supply and demand, are regulated by edict. Even the money supply, Professor Usher tells us, is of no consequence, because "paper credits" could be offered on security of "a great variety of credit values," and "there would be plenty of real value because there would be plenty of work; the Government would see to that." These measures "seem to conform accurately to the experience of history."

Professor Usher, in short, though supporting his statements of fact or planning by no citation of authority, clearly makes out on his own account something like a case for war as a blessing to industry, trade, finance, and credit. We are ourselves inclined to cling to the old and pretty thoroughly tested conception of war as an instrument purely of economic havoc. The confusing, in his argument, of drastic expedients to stave off instant ruin with expedients to establish orderly and permanent prosperity, is too plain to be mistaken. We doubt if even the General Staff has assumed quite as much as Professor Usher. A rather generally accepted German authority on the war problem begins his discussion of its economic aspects by admitting that the argument for economic breakdown, under the strain of maintaining armies on the present scale, has strong *prima facie* grounds. The result would be averted, he imagines, by releasing part of the fighting force, from time to time, for home production. That actual economic strength could be derived as a consequence of the war, does not occur to him; and in a military deadlock where both sides were inspired with equally strong moral purpose, success would come presumably to the belligerent "who can hold out financially longest."

On questions such as this, it will require courage for outsiders to dissent from the above remarks of Gen. von Bernhardi.

UNHAPPY POLAND.

The Partition of Poland, a century and a half ago, was long the favorite example, for American orators, of a great international crime. And until within a couple of decades, the interest of our people in Poland remained largely rhetorical and literary. Not till the Polish emigration to the United States assumed large proportions did we begin to think in a more vital way of the actual Poland of the present day. This feeling for a contemporary, breathing Polish people has, of course, been greatly quickened by the European war, yet even now it may be doubted if Americans have anything like an adequate realization of the unhappy plight of the Polish provinces of Russia, Austria, and Prussia. They are, in fact, to be ranked high among the victims of the war.

Few of us stop to reflect how the tide of battle has swept back and forth over the fields and towns of Russian Poland and of Galicia, with all the widespread suffering and destruction and horror which this has caused. We think of East Prussia as German, and set down the Russian invasion of it as a blow mainly felt at Berlin; but the province contains a large Polish population, and it is of a sort in general not able to flee before the Cossacks, and so most exposed to the miseries of war. Indeed, those cannot be far wrong who assert that the Poles are as fully deserving of commiseration as the Belgians. More than five hundred towns, chiefly occupied by Poles, are reported to have been destroyed in the course of the fighting which has surged back and forth. The distress of thousands of helpless civilians has so impressed their compatriots and sympathizing friends in this city that a Polish Relief Committee has been organized, with headquarters at 105 West 40th Street, of which Madame Marcella Sembrich is the honorary president. The need which it is designed to meet is unquestionably great and piteous.

One of the ghastly tragedies of the war is the way in which compulsory military service has forced Poles to fight against Poles. There are great numbers of them in the Russian army; and perhaps as many more in the ranks of the Austrians and the Germans. They have all, so far as known, done their military duty; but it must add a bitterness to death for them to know that it is their own blood kindred whom they are, in many cases, compelled to fight. International law no longer permits a conqueror, like Napoleon, to force the troops of a beaten army to take service under his banner and possibly to lead them against their own countrymen. But virtually such a fate has befallen the Poles this year; the far-off consequences of the breaking up and partition of their ancient kingdom having been to set them in unnatural battle array against each other.

But what of Polish hopes growing out of the war? Is there any real foundation for the belief that its close may see a reunited and autonomous, if not independent, Poland? Up to the present, all that the Poles have to go upon is vague promises. Their friendship and support have been actively competed for. It was before the end of August that the Russian Grand Duke issued his manifesto and appeal. His language to the Poles was that "the hour has struck" for fulfilling the "holy dream of your fathers." "Let the boundaries cutting asunder the Polish people be effaced; let them unite under the sceptre of the Czar." Under that sceptre Poland was to be born again, "free in religion, language, and self-government."

This was well fitted to stir Polish enthusiasm, but, after all, was there anything in it more solid and sure than in the proclamation of the German commanding general, von Morgen? He caused it to be posted in the parts of Russian Poland invaded by German arms: "Arise and drive away with me those Russian barbarians who have made you slaves. Drive them out of your beautiful country, which shall now regain her political and religious liberty. This is the will of my mighty and gracious King." No wonder that the Poles have doubted both these advances, and have been quietly organizing a new party which takes as its watchword, "We do not want to hear of Russia or of Austria or Germany. We want only one thing—the Polish state without guardianship from any side."

Georg Brandes, in the *Day*, declares that this is a political impossibility. It is no time, in his opinion, to begin shouting *Polonia farà da sè*. That Poland should be able of herself to attain her freedom he holds to be out of the question. This may be so; and yet when the final settlement is made after the war, the case of the Poles will plainly demand special consideration. The wonderful way in which, for a hundred and fifty years, though no longer a nation, they have kept alive their intense national spirit, refusing to blend with their conquerors; and the burning high again of their hopes in the midst even of the devastation which the war has brought upon them—all this must be allowed weight. If the war is to end in a brighter day for small nationalities, the just demands of Poland cannot be wholly overlooked.

THE RATE DECISION.

Opinions still differ concerning the exact scope and effect of the decision of the Interstate Commerce Commission, on Friday, in the matter of the petition of the railways to be allowed to establish higher freight charges. More time will doubtless be needed to balance detail against detail, and to arrive at an accurate estimate of what the result will mean to the railways in dollars and cents. It appears to be safe to say at once, however, that the contentions of the roads have been virtually admitted by the Commission. It concedes the force of their arguments, and does not seriously question their statistics and the inferences from them. They asked, roughly, for a 5 per cent. increase in freight rates, and this is granted to them, with the exception of certain commodities and certain routes, or combinations of routes, of traffic. But the latter must have been expected. The net result is, we doubt not, as full a compliance on the part of the Commission with the reasonable requests of the railways as sensible railway managers could at any time have counted upon.

And it should not be forgotten that a sound judgment of the decision will take into consideration more than the actual amount of increased railway revenue that may follow. This is important; in some cases it may prove to be absolutely vital. Yet we believe that the few millions, more or less, which will soon be placed in the treasury of the companies, will not signify so much to their officers as will other aspects of the decision. The money to be had is one thing; the moral effect of receiving permission to obtain the money is another and a larger thing. It is confidently to be expected that the credit as well as the income of the railways will be enlarged. If they need to borrow, in order to enlarge equipment and spend more on maintenance, it is probable that they can now do so without such general recourse to short-term notes, at high rates of interest, as has lately been common. With more funds in sight, and with railway credit placed upon a broader and more secure basis—not the least part of it being the restored public confidence which we are almost sure to witness—it would seem that not alone the business which comes *to* the railways, but the business which comes *from* them, ought soon to wear brighter promise than for a long time back. In all these aspects of the matter, we may well look upon this decision as something like a landmark in railway finance.

Upon the immediate effects of the rate decision, the attention of both the railways and the public will be for the time being fixed. This is inevitable, and it is proper. The Commission itself was bound to pass upon the merits of the railway case as that stood at the time. Any attempt to take a long look ahead, in the endeavor to foresee every consequence and to guard against every possible mischief, would have been unwise. We can't be always wondering what lies on the other side of the hill. A present emergency has to be met by the best light of the present, with the ultimates left to be dealt with as they arise. It was apparently in this spirit that the majority of the Interstate Commerce Commission acted. And the general approval which their decision has received, and, in our opinion, deserved, will only be heightened by a consideration of some of its indirect and far-reaching results.

For one thing, we think it will go a long way towards raising the Interstate Commerce Commission itself in public esteem. There is no denying that it has been out of favor for a long time back. Complaints about it have been as thick as blackberries. Nor have all of these been wanton. The most friendly critics have been compelled to protest againnst the Commission's delays. If these have resulted from an unavoidable congestion of business, that fact only gives edge to another form of dissatisfaction with the Commission. It has been described as a grab-all. It wants to inquire into everything, so it has been said, and to meddle with everything. Then there has been much outcry about its mixing up of functions. These are partly judicial, partly legislative. Latterly, it has employed a kind of prosecuting counsel, making it a sort of tribunal unknown elsewhere in the world. So the bitter argument has run, but we shall hear less of it for a time. The Commission has shown that it can be both prompt and fair in a case of great importance. Its personnel and its work will be less evil entreated.

In a still broader way, one effect of the decision will be to make the people more hopeful about the whole question of government regulation of railways. It was a fateful experiment upon which this country entered with the creation of the Interstate Commerce Commission. With its ups and downs we are not here concerned. It has doubtless been at times misunderstood and misrepresented. Its powers and its duties have not always seemed to be clear. But all along it at least represented an effort to bring a great public activity within a reasonable public control. And from that original purpose the country has not been swayed either by abuse of the Commission or by the appeals of Mr. Bryan and others to leave it behind as an outworn instrument and proceed to the ownership and operation of railways by the Government itself. Against so rash a flying to ills that we know not of, this latest decision by the Commission should be an added preventive. Americans will not believe that regulation is "played out." In this exercise of the powers of the Interstate Commerce Commission they will see proof of fairness to all the parties in interest, and of flexible adaptability to the changing needs of both railways and the public.

ODDS AND ENDS ABOUT INCOMES.

The main facts brought out by the returns of the income tax concerning the number of American incomes falling between specified limits were made public nearly two months ago. In the annual report of the Commissioner of Internal Revenue, now before us in full, we look rather for gleanings that gratify or pique curiosity than for the broader facts that throw light on the distribution of wealth. However, there are some points that have interest, and which it may be worth while to mention.

Of the fifty-two political divisions listed —the forty-eight States, the District of Columbia, Alaska, Hawaii, and Porto Rico— there are thirty-six which show no individual incomes in the highest classification, while the remaining sixteen do show such incomes, ranging in number from 1 to 82. The highest classification in the tables is, however, not that of incomes exceeding $1,000,000, but of incomes exceeding $500,000. The Government does state the total number of persons declaring incomes above $1,000,000, the aggregate of these in the whole country being 44; a point that gave rise to much discussion and conjecture when first announced. But as to the incomes above $500,000 we now learn that one each is to be found in California, Delaware, Minnesota, Vermont, and Wisconsin; two each in Maryland, New Jersey, and Rhode Island; three each in Connecticut, Massachusetts, Missouri, and Ohio; six in Michigan; eleven in Pennsylvania; thirteen in Illinois, and eighty-two in New York. Thus it appears that none of these big incomes are to be found in "the Solid South," the only ones in what are generally thought of as Southern States being the two in Maryland and the three in Missouri, and that, exclusive of Minnesota and Missouri, there is, in the whole vast region west of the Mississippi River, only one solitary income of the kind, namely, the one in California.

That of the whole array of the biggest incomes, 135 in number, as many as eighty-two —very nearly five-eighths—should be found in the State of New York is not surprising. But it seems a little strange that Massachusetts should show only three, the same as Connecticut; and even more strange that there should be only one more in Massachusetts, with its 3,400,000 inhabitants, its numerous big manufacturing towns, and its traditional great wealth, than in Maryland, with 1,300,000 inhabitants, no considerable city except Baltimore, and a level of wealth apparently far below that of Massachusetts. The case of New Jersey might be thought even more surprising, were it not for the fact that the great army of Jersey commuters whose place of business is in this city were required to report from this city, the instructions directing that returns be made from the individual's "principal place of business." But a study of the figures, going beyond these mere surface facts of the highest classification, and considering the lower classifications and the amounts collected, might bring out some very interesting peculiarities. And to what extent these peculiarities reflect the facts of wealth or income, and to what extent they turn on questions of conscientiousness in making returns, is an inquiry that might prove to justify careful examination.

It is the desire of the Government to give no information as to the income-return of any particular person. But there are, in the tables before us, the makings of a very interesting game in this regard. One is reminded of the story of a Roman cardinal who, in a distinguished social gathering, was telling of his early experiences as a simple priest. His very first penitent, he said, confessed a murder to him. Presently there entered a great nobleman, who greeted the Cardinal with great *empressement*, saying that he had remembered through all these years that he had been the first penitent the Cardinal had received. When the Government tells us that there is just one man in Vermont, say, or Delaware, who returns an income of over $500,000; and when, upon another page, we find the total receipts in that State from the 6 per cent. supertax on incomes above $500,000, it is apt to be a pretty easy guess who the man is, and it is not at all a guess, but a certainty, what income he reported for taxation. And even the zeros, perforce, tell a tale not less interesting. Wherever there is a State with nobody in the over-$500,000 class, one is able to say with certainty that *this* man or *that* man, supposed to be enormously wealthy, did not acknowledge an income of that magnitude.

Further than this, deponents say not; but there is evidently here plenty of meat, both for the "Sunday" feature writer and for the solemn young worker for a Ph.D. The former might look up lists of multimillionaires, and point out who's who— and still more who ought to be who— in the various States. And the latter, running his eye over the tables, would soon find his pencil itching to plot curves of correspondence between income and illiteracy, or what not, which, if they did not point a moral, might at least help to adorn a thesis.

Chronicle of the War

The most dramatic event of the war last week was the raid on December 16 by German cruisers on Scarborough, Hartlepool, and Whitby, towns on the east coast of England. Taking advantage of a foggy night, three swift battle cruisers and three armored cruisers eluded the blockade maintained by the British fleet in the North Sea, and at about daybreak appeared off the east coast of England and began the bombardment of the towns. A considerable amount of damage was done to property, and over one hundred people, all but seven non-combatants, were killed and more than three hundred wounded. The bombardment lasted about half an hour, after which the cruisers departed. They were subsequently engaged by British destroyers, but their superior speed and armament enabled them to beat off the British vessels, and their escape was facilitated by the fog. It was announced from Berlin that two British cruisers were sunk in the action, but this report proved false. One or two of the destroyers suffered some damage, and there were a few casualties on board the British ships. The German official announcements of the exploit are careful to speak of the squadron having bombarded "fortified places," but it appears that of the three towns Hartlepool alone, and that only in a very technical sense, can be regarded as fortified, Scarborough and Whitby being entirely unprotected. Comment on this aspect of the affair will be found in our editorial columns.

Berlin during the past week has been much occupied with rejoicings over the success of the naval raid and a defeat of the Russians in Poland. The material results of neither achievement seem altogether commensurate with the amount of enthusiasm they have inspired. The raid on the English coast is difficult to explain on other than political grounds. The results achieved from a strategical standpoint were absolutely nil. Indeed, the principal result appears to have been, as might have been fully expected, to give an enormous impetus to recruiting in England. The risk taken (the possible destruction of first-class ships, which Germany could ill afford to lose) was out of all proportion to any possible naval advantage that might accrue. What, then, was the object of this spectacular adventure, and why, on slight evidence, so far as official announcements from the front went, was semi-official encouragement given to the people of Germany to celebrate a crushing victory over the Russians? Official warnings were issued later against a too-buoyant expectation of immediate results, but meanwhile the rejoicings had taken place, inspired by a message from the palace to the Reichstag that the greatest victory of the war had been won.

These two events seem to gain significance in the light of what immediately preceded them, the naval defeat off the Falkland Islands, the disaster to the Austrian army in Servia. The naval raid was Germany's answer to the destruction of her ships in the South Atlantic, designed to relieve public depression and to stimulate enthusiasm and confidence. The advantage gained in Poland and Galicia came opportunely, and was suffi-

ciently substantial to lend itself easily to exaggeration to the dimensions of a sweeping victory. This was useful in Germany, but it was infinitely more useful in Austria as a counter-stroke to the defeat at the hands of Servia, and it seems a not unreasonable supposition that it was designed primarily to impress public opinion in the Dual Monarchy. Through the veil of censorship which in Austria, as in Germany, hides any expression of public sentiment, there have been visible recently several indications that no such unity as binds the German people together obtains among the heterogeneous population of Austria-Hungary. By way of Italy and Switzerland there have come in the past few days several reports of anti-war demonstrations, both in Hungary and in Austria, and these reports reveal the existence of a bitter sentiment against Germany, an impression that Austrian soldiers are being sacrificed to the attainment of German ends, and a feeling of resentment against the complete domination of Germany in the councils of the Empire.

Taken in connection with the recent riots, the expression of opinion attributed by the *Gazette de Lausanne* to an Austrian diplomatist, and published in the New York *Times* on Tuesday, is significant. This diplomatist, who is unnamed, but is described as "a statesman who had his hour of notoriety," makes a strong plea for a separate peace and the abandonment of Germany. In his view, German victory would be as disastrous for Austria-Hungary as would the defeat of the Dual Alliance, and the only hope for the Empire lies in an immediate peace independent of Prussia. In default of thoroughly trustworthy information concerning internal conditions in the Dual Monarchy, it would be unsafe to base any definite conclusions on the evidence of dissensions that has reached us, but it seems not improbable that internal troubles in Austria-Hungary may ultimately, and possibly before very long, have a profound influence on the course of the war, and some support would appear to be lent to this view by the coincidence of the naval raid and the exaggerated reports of Russian defeat following hard on the news of disaster to Germany by sea and to Austria on land.

The interdependence of the eastern and western campaigns becomes increasingly apparent. The present aggressive of the French and British is dictated principally by the conditions of the eastern campaign. To Poland and Galicia strong German reinforcements have been sent from France and Flanders, and it becomes the business of the Allies to take whatever advantage they can of the consequent weakening of the German forces in the west, and to make it impossible for more troops to be spared from that region for the campaign against Russia. Concerning the fighting in the west there is little to add to what we said last week. On the whole it has been favorable for the Allies, and progress is reported virtually all along the line; but it has been so slight that the bare mention of geographical names to indicate its extent appears almost meaningless. Whereas in the earlier stages of the war progress of either side was marked definitely by the names of towns and villages, we measure now by hamlets and houses, and are intrigued by such expressions as "the house of the ferryman" or "the inn of Kortaker."

For some weeks now attention has been centred principally on the see-saw of the Russian campaign. It was riveted there by the announcement from Berlin on Thursday of last week of the sweeping victory to which we have alluded. This was the culmination of a series of battles which began about November 10, when, as we described in the *Nation* of December 10, the new German attack from Silesia commenced. The occupation of Lodz on December 6, and the retirement of the Russian army to new positions, was brought about by a fierce frontal battle that lasted some ten days. The Russian centre was then pushed back at Lodz. Strong German reinforcements were brought up, and while von Mackensen pounded at the Russian right on the Bzura River, its left in Galicia was attacked by the Austrians pouring over the Carpathians, reinforced by three army corps withdrawn from Servia, and by German troops sent round from the Czenstochowo-Cracow front to the Carpathians. On December 17 came the news of simultaneous success by the Teuton allies on the two wings, by the Germans on the Bzura River, by the Austrians at Limanovo, southeast of Cracow. The Austrian report indicated precisely the line of battle, stating that the Russians were retreating on the front Rajbrot-Niepolemice-Wolbrom-Novo-Radomsk-Piotrkow. Piotrkow was evacuated on December 16, and the railway from Warsaw to Czenstochowo was thus cut by the Germans. Skierniewice, on the railway line from Piotrkow to Warsaw, also appears to have been abandoned. This, however, seems to have been the limit of German success. The Russians, outnumbered, retreated to a narrower front already prepared, extending from the Vistula along the right bank of the Bzura River to the River Rawka, and thence to Rawa. Here it appears that a determined stand has been made, and Russian reports, while fully admitting a retreat, deny absolutely that it was hasty or disordered.

In Galicia also the force of the Austro-German drive from the region of Cracow and from the Carpathians seems to have spent itself for the time being. We hear of severe fighting still on the lower Dunajec River, and we can surmise that thereabouts the line extending from Southern Poland into Galicia forms an elbow, turning eastward towards Krosno and Sanok. Thence we may assume that it extends across the Carpathians, for we still read of fighting in the region of the Latorcza River, which is on the Hungarian side of the mountains. Summing up, then, the situation seems to stand thus: The Austro-German aggressive has not succeeded in relieving Przemysl. The pressure on Cracow is relaxed for the moment, but it is likely to be renewed at any time by another turn in the fortune of the campaign similar to those which have twice already enabled the Russians to drive the German armies back to their own border. Meanwhile the Russian operations in Northern Poland in the direction of Mlawa appear to have been successful, as we learn that the German troops there have fallen back towards the line of Lautenburg-Niedenburg, across the frontier into East Prussia. There appears, therefore, to be some prospect that the Russian troops in this region may succeed in joining hands with the forces which have been established in the Mazurian Lakes district since the beginning of November.

Foreign Correspondence

THE WAR LOAN—AN ANXIOUS DAY IN THE NORTH SEA—A VISITOR FROM THE TRENCHES—THE COMMISSARIAT.

By SIR HENRY LUCY.

WESTMINSTER, December 5.

The success of the war loan is in its moral effect equal to a great victory in the field. Never before was a Chancellor of the Exchequer authorized to levy a loan of three hundred and fifty millions. It was expected that in the flush of patriotism supply would not fall far short of stupendous demand. As things turned out, it was exceeded by a sum which in ordinary times would serve the current needs of the State. A peculiarly satisfactory feature of the movement is the large number of applicants for comparatively small sums. Everybody wants to have a finger in the patriotic pie. When the Boer war loan was raised, the number of such applicants was about 25,000. To-day it is 100,000. This subsidy will serve to carry on the war up to Midsummer Day. There is increasing hope that by that time peace may be in sight. If not, a rarely United Kingdom will be prepared to subscribe another loan of equal amount.

Mr. Lloyd George reckons that at the end of the financial year national expenditure will exceed the rate of 535 millions per annum. That is a frightful sum, a fine upon unoffending peace-loving people imposed by the arbitrary action of the German Kaiser and people. At the end of the first three months it was found that the war had cost half as much again as the Crimean War, which extended over three years, and almost half as much as the Boer War, which ran into four. It is possible to regard it as one of the best investments ever made by this country. When militarism in Germany is finally crushed by efforts of the Allies, there will be practicable for us a saving of from forty to fifty millions a year in naval and military expenditures.

Those who remember the storm created in Parliament and the country four to five years ago, when the question of additions to the fleet came up, will regard with astonishment the manner in which Mr. Winston Churchill, in a parenthesis as it were, mentioned that within the next twelve months the number of super-Dreadnoughts will be increased by thirteen. In Mr. McKenna's time at the Admiralty the Government, hampered by threats of revolt by a section of their supporters, proposed to provide a maximum of four. George Wyndham, like Mr. Wegg dropping into poetry, crystallized the demand of the Opposition in a couplet which attained wide vogue:

> We want eight,
> And we won't wait.

Mr. McKenna's successor, without saying "by your leave," lays down the keels of thirteen of the biggest battleships, and is rewarded by a general cheer in the House of Commons reëchoed through the country. In the same period of time Germany, straining to the utmost her resources and opportunities, can increase her naval strength by only three ships. Here is another striking fact pointing to peace early or late in the coming year. England's forces on sea and land, instead of growing weaker, are appreciably in-

creasing, while Germany's are as steadily diminishing.

When the secret history of the British fleet in the North Sea comes to be written, a profoundly striking entry will appear under date Thursday, November 12. On that day I happened to be lunching with ———. (I anticipate the action of the censor by leaving here a blank.) Suffice it is to say that if my host does not know the inner secrets of the Admiralty, others must be wholly in the dark. He told me that on that night the long-interned German fleet would break out into the open sea. The occasion was, with German precision, selected because by rare coincidence the state of the tide and the late rising of the moon presented tempting opportunity. Admiral Jellicoe, getting wind of the intention, made every preparation for meeting it. "Within twenty-four hours," said the great man jubilantly, the light of battle in his eyes, "the two fleets will be engaged in an action in its way commensurable with the fighting in Flanders or Poland." For three weeks I have respected the confidence reposed in me and abstained from allusion to this conversation. There is no possible harm in recalling it now. As we know, nothing happened. The explanation probably is that the Germans, knowing their secret was out, and that the British fleet cleared for action, awaited them, at the last moment abandoned an intended surprise.

On the eve of the prorogation the Prime Minister was questioned as to the truth of the report that the only son of Prince and Princess Christian had joined the German Army, and was actively engaged in fighting the Allies, numbering among them the country which for nearly forty years has made handsome provision for his family household. Mr. Asquith, with evident reluctance, was obliged to answer in the affirmative. He made no reply to the direct question whether in such case the pension of £6,000 a year paid out of the national exchequer to the Princess Christian and her husband would be continued. The matter will not be allowed to remain as it stands. The Committee of Supply will, early in next year, afford an opening for further discussing the matter. It will be seized by the Labor party and the Radicals below the gangway. What can be done in such matters is shown by the fact that since the outbreak of war the annuity of £3,000 a year granted by Sir Robert Peel to the Princess Augusta of Cambridge (Grand Duchess Dowager of Mecklenberg-Strelitz) has been withdrawn.

The amazing fatuity of the Press Bureau is illustrated afresh by publication of Sir John French's second dispatch. This masterly document takes the form of a diary of operations on the far-flung battle-line in Flanders. The first entry is made on October 3, the final one on November 2. Even for the civilian this terse record of skilful generalship and dauntless courage is of profound interest. Much more keenly, because more intelligently, will it be studied by military men at home and abroad. But why in the name of common-sense should the earlier entries have been held over for nearly two months, the conclusion for four weeks? The official explanation will, of course, be the stereotyped one that in the public interest it is not desirable that the enemy should have early information of events—in which, by the way, they personally shared, and whose trend they (or those who survive) have for weeks brooded over with saddened recollection. There need be no indecent hurry in the matter. Supposing the diary had been published weekly. Being exclusively concerned with past events, it could not have been of slightest service to the enemy, while its comparatively prompt publication would have been gratefully accepted by a nation hungering and thirsting for news from the front. A characteristic touch of banality is added by the fact that, though the Field-Marshal's dispatch is dated November 20, and probably reached the War Office by special messenger on the following day, it was not circulated till ten days later, having in the meanwhile been pigeonholed in the office of the Secretary of State.

WESTMINSTER, December 12.

Evidence of Sir John French's desire to ease as much as possible the strain upon men at the front is forthcoming in an arrangement recently made whereby officers in rotation enjoy a term of five days' leave. This enables them to get home for practically three full days. Yesterday I had a visit from one of these holiday makers, and learned from his smiling lips some particulars of life in the trenches. It was marvellous to see this debonair young fellow, faultlessly dressed, and to realize the description of himself, laughingly told, as to his personal appearance only four days earlier—his face unwashed and unshaven, his war-worn khaki thickly crusted with mud, his shoes and puttees soaking wet in the flooded trenches. His delight in getting home, having a bath, a shave, a total change of clothing, and sitting down at a prettily furnished table, to eat a daintily cooked meal, was almost childish in its exuberance. Only one day more of it. But there was no trace of regret or repugnance in view of the prospect of forthwith returning to life in the trenches, with death momentarily at hand.

This is the state of mind, prevalent in all ranks, that minimizes the horrors of war and strengthens the heart and hand of our soldiers. They make the best of everything, especially of bully beef, which is their daily unvarying fare. It is, I learn, nothing more nor less than the best Argentine beef, packed in tins weighing a pound, one being a man's daily rations. It is ready cooked, but some of the men, naturally skilful, make out of it varied dishes. The officers, who share with their men the bully beef at lunch and dinner, generally manage to get a rasher of bacon served with their morning tea. It is always tea, no coffee. Native bread is a scarcity in Flanders, and the British troops are served from the produce of camp kitchens rigged up in the rear. Food is in abundance, all of excellent quality. None are more appreciative of this specialty of the campaign than the sprinkling of old soldiers who took part in the Boer War. Said one, munching a chunk of bread thickly plastered with excellent butter, "When we was in South Africa they used to give us dubbin for butter." Dubbin, I perhaps need hardly explain, is the nauseous, greasy substance which in wet weather is rubbed into heavy walking-boots. The story is obviously an exaggeration born of the high humor common to the trenches. But it not unfairly illustrates the difference between the daily lot of the British soldier at meal-times to-day and his condition under the lamentable administration, in big things and little, that marked the Boer War. Jam is popular and plentiful, and every man who cares for it has his daily "tot" of rum.

I showed the captain a postcard that reached me by the morning delivery, one of the regular shower of demands for subscriptions started by private persons with avowed intention of alleviating the lot of the soldier in the field and of his family left behind him. "A fund has been started," thus it runs, "to provide a £600 motor coffee stall for supplying hot coffee and soup to men in the trenches. Please send a shilling (not stamps) to Miss ——, and post a copy of this card to three friends (not mutual), signing your own name."

The project set forth in this admirably precise and concise fashion greatly added to the chronic amusement of the cheery captain. That a single motor coffee stall, even though it cost £600, should be of practical use along a line of trenches measured by scores of miles indicated appalling ignorance. How, he asked, was the coffee stall to approach the trenches within hailing distance? If that difficulty were overcome, did the lady propose that the men in the trenches would stroll out, cluster round the coffee stall, as is the custom at some corners of London streets, and leisurely toy with their cup of coffee or basin of soup? If they did, they would within five minutes be disturbed by the arrival of a fresh customer in the form of a shell that would make short work of the £600 coffee stall, its enterprising keeper, and the ring of customers. "The fact is," said the captain, "the conveyance of food to the trenches is one of the most difficult and dangerous bits of business in the campaign. It engages the services of a specially trained body of men, who can work only under shelter of the darkness of night."

Darkened London, through which citizens are beginning to learn how to grope their way at night, will presently have its condition paralleled by widely spread districts of the country. Last night householders in Hythe, Seabrook, Sandgate, Cheriton, New Romney, and Romney Marsh, all on the Kentish coast, were served by the Constabulary with peremptory orders to obscure their business and domestic lights. Notification is given that no shops, hotels, picture palaces, or other buildings will be permitted to show any exterior lights. The interior lighting of all shops will not be permitted to give extra illumination to the roads and streets, so that such illumination can be seen from the sea or sky. Where dark blinds are not partially drawn so as to obscure the interior lighting all lights visible from the roads or streets must be shaded blue or gray.

White or cream-colored blinds are ruled insufficient without extra shade. Red blinds must be shaded. Venetian blinds must be turned to obscure any lighting from within. Buildings with glass roofs or skylights must be adequately treated to prevent light being visible from the sea or from above. Proprietors and owners of public and private buildings are warned that any person or persons failing to comply with these regulations are liable, under the Defence of the Realm acts and recent orders in Council, to severe penalties, and that if necessary—"although it is hoped that there may be no occasion for it"—such penalties will be strictly enforced. I understand that similar notices have been distributed in all towns, hamlets, and villages along the east coast of England and Scotland

A Study of Sources

ENGLISH INFLUENCE IN COUNT VON BERNSTORFF'S ORATION.

In his celebrated oration on "The Development of Germany as a World Power," delivered before the American Academy of Political and Social Science on November 6, 1909, Count J. H. von Bernstorff, German Ambassador to the United States, exhibits a surprising amount of English influence. The oration was published as a supplement to the Annals of the Academy in January, 1910 (Vol. 35, at the back), and a sumptuous reprint was struck off marked "Copyright 1910, by the American Academy of Political and Social Science."

A comparison of this grave work with William Harbutt Dawson's book, "The Evolution of Modern Germany" (London: T. Fisher Unwin, 1908. "All rights reserved") makes it plain that, in the language of doctors' dissertations, "the two works exhibit remarkable coincidences of character, situation, and language." The coincidences begin comparatively early in the Oration. Thus, take this passage:

Impartial students of Germany's position will find themselves confronted by economic facts which alone sufficiently explain why Germany has to turn its attention to the expansion of its influence abroad. (Bernstorff, p. 11.)

The candid student of Germany's position finds himself confronted by economic facts which alone sufficiently explain why Germany is to-day turning its attention with increasing urgency to the expansion of its influence abroad. (Dawson, pp. 335-336.)

Or this, on the same page, after the orator has borrowed a few statistics and estimates (uncredited) of the tremendous growth o German population:

The question which these facts raise is primarily economic: how will this large population be employed; how will it live? (Bernstorff, p. 11.)

The questions which these facts raise are, of course, primarily physical and economic Where will this large population live; how will it be employed; how will it be fed? (Dawson, p. 336.)

Or this, on the same page:

I cannot but think that if this fundamental fact of Germany's enormous annual increase of population were intelligently grasped, muoh of the unfortunate polemic to which my country's industrial expansion still gives rise in certain quarters would be moderated. (Bernstorff, p. 11.)

One cannot but think that if this fundamental fact of Germany's enormous annual increase of population were intelligently grasped, much of the unfortunate polemic to which that country's industrial expansion still gives rise in certain quarters would be moderated. (Dawson, p. 338.)

The rest of page 11 comes almost bodily out of Dawson, with the difference that it is word for word a long quotation from Dr. Paul Rohrbach's "Deutschland unter den Weltvölkern." Dr. Rohrbach receives due credit by Mr. Dawson, of the enemy, but n credit or mention from Count von Bernstorff, his compatriot.

Page 12 is similar, except that his Excellency skips playfully back and forth ove. pages 339, 340, 341, and 343 of Dawson. It i practically all clipped from Dawson, sentenc by sentence. Compare:

Between a present national ratio of 300 persons per square mile and the ratio of Saxony, Rhineland, and Westphalia, there is a difference which represents a population of some forty millions, and within that limit there is clearly a very considerable capacity for expansion. This expansion can, however, only be on industrial and not on agricultural lines. There is no reason to believe that the corn-growing capacity of Germany is as yet exhausted, yet it is a fact, which points its own moral, that, in spite of the careful protection of the agricultural industry, the production of food corn, while it increases absolutely, has ceased to keep pace with the growth of the population. The best that can be hoped is therefore that for a time corn-growing will hold its own. (Bernstorff, p. 12.)

Between a present national ratio of 300 persons per square mile and the ratio of the West of Prussia there is, however, a difference which represents a population of some forty millions, and within that limit there is clearly a very considerable capacity for expansion. This expansion, will, however, be on industrial and not on agricultural lines. . . . There is no reason to believe that the corn-growing capacity of the country is as yet exhausted, yet it is a fact which points its own moral that, in spite of the careful protection of the agricultural industry, the production of food corn, while it increases absolutely, has ceased to keep pace with the growth of population. . . . The best that can be hoped, therefore, is that for a time corn-growing will hold its own, etc. (Dawson, pp. 340, 339.)

Dr. Rohrbach suffers depredations, as before, again on page 12, to the extent of a quarter of a page of his choicest conclusions, with no quotation marks. Dr. Rohrbach, let me add, is not the only German writer who thus is pillaged, for on page 10 of the Oration Professor E. Paulsen is made to contribute half a paragraph, *mot à mot*, with no credit, or mention.

Why waste good white paper in paralleling page 13, since the observed phenomena are the same? Here Herr Rohrbach's well-known conclusions on the value of colonies are incorporated with sure selection, but with true impartiality his Excellency has again been careful to omit Mr. Dawson's conscientious acknowledgment of the source. Some of the latter's remarks on the decline of German emigration to South America are clipped *literatim* to assure his Excellency's hearers that Germany has no designs on that continent.

We must contrast Mr. Dawson's moderate and generous treatment of Germany, rising at times to the dignity of chivalry, with the fashion in which the Ambassador uses the Englishman's material to further his own spiteful innuendo against England. Not only does his Excellency annex statements of fact, but he offers as his own Mr. Dawson's carefully argued opinions upon questions of German domestic politics, or else he first uses the original author's words, and then substitutes his own deductions.

To sum up, the core of the Ambassador's Oration is merely an appropriation from the English book. Omitting many courtly phrases, and some discussion of an American book on a similar subject, there remains little but Mr. Dawson's estimates, observations, researches, and conclusions throughout, with no mention of him anywhere. We congratulate his Excellency upon his good judgment in selecting authorities, but he does not flatter the American Academy of Political and Social Science in assuming it to be ignorant of Dawson, Rohrbach, and Paulsen.

BERT EDWARD YOUNG.

[One of our correspondents has received the following letter from Mr. Dawson, and asks that it be made public.—ED. THE NATION.]

KENERTON ROAD, BECKENHAM, ENGLAND.
9 October, 1914.

DEAR SIR: Will you accept my cordial thanks for your thoughtfulness in calling my attention to the wrongful and indefensible use made of my book, "The Evolution of Modern Germany," by Count Bernstorff, in the address on "The Development of Germany as a World Power" given by him before the American Academy of Political and Social Science (Philadelphia) and published in the annals of that institution? Hitherto I had not been aware that the Count had passed off as his own long passages taken from this book, but having now had an opportunity of reading the address as published, I can only confirm with regret your statement that a wholesale and quite unacknowledged appropriation of my labors has been made.

Not only does the Count annex passages containing statements of fact, but he even puts forward as his own my argued opinions upon various questions of German domestic politics. In other cases he first uses my words and then substitutes his own conclusions for mine—not a very ingenuous proceeding, I venture to think. My only comfort is that, where Count Bernstorff quotes from two German writers used, and of course named, by me in this book, he impartially claims authorship of these borrowed passages likewise.

Acting on your suggestion that this act of plagiarism should be disclosed, I am calling the attention of the American Academy of Political Science to the facts, and I do this with the greater justification since I observe that the Academy claims "copyright" for the Count's address, although to it, all unknowingly, I prove to have made a quite considerable contribution. Need I say that I attribute to that honorable body no responsibility for what has happened?

For the rest, I prefer to leave the matter to public, and especially literary, opinion, only adding the expression of a hope that the Count's ideas of literary integrity will not be reflected in his further activities either as an exponent of Germany or a critic of British political history and diplomacy.

Again thanking you for your courtesy, I am Yours faithfully,

(Signed) WILLIAM HARBUTT DAWSON.

The Race Problem

ITS DANGERS AND OPPORTUNITIES—SIGNS THAT THE COUNTRY'S ATTITUDE TOWARDS THE NEGRO IS CHANGING FOR THE BETTER.*

By OSWALD GARRISON VILLARD.

I.

The smouldering intensity of the race problem in America is well illustrated by the steady stream of books dealing with it which reaches the reviewer's desk. Every shade of opinion is usually represented, but in the list before us the hopelessly bitter anti-negro screed is fortunately lacking. It is a sign of good omen, as is the fact that the book of emotion and purely personal feeling without knowledge is less and less to the fore. Instead, we have a growingly serious effort by white and colored writers alike to deal in a scientific spirit with what is the least solved and least understood of our social problems; to apply to it the laboratory method so warmly urged as the necessary resolvent in all matters sociological.

I would not, of course, deny that the tract is still urgently needed. There is so much that cries out to high Heaven in our treatment of the negro that ardent appeals to the American conscience, to our spirit of justice and fair play, must still be in order. Dr. Du Bois's "Souls of Black Folk" remains the high-water mark of this form of writing, as is attested by its reaching its ninth edition—one of the few really great books to come out of the South since the loosening of the fetters. But notable as is this portraiture of a soul oppressed, there is the greatest need of still other forms of writing, such as the coldly scientific portrayal of historic fact and the calm analysis of the clashing elements in this social and political problem. There is, moreover, increasing need of interpreting not only the views and aspirations of one race to another in a friendly and helpful spirit, as does Booker Washington, but of approaching the Southern difficulties as a governmental question to which some answer must be found that is consonant with the grim realities—so grim as to make quite possible the appearance any day of a new "Uncle Tom's Cabin."

Is it not incredible, in view of the magnitude and threatening character of the problem, that it remains practically untouched from an administrative point of view, that it is almost wholly overlooked by our governmental agencies, that our statesmen are indifferent to it? Even President Wilson, with his keen constructive mind, his readiness to tackle every other problem and to offer a solution for it, is content to pass this by when he can, or if he cannot, to lose his temper over a rudely aggressive recital of the race's wrongs, or to dismiss the question with a story as he did the other day when a group of Southern investigators called upon him. If it is the despair of our statesmanship, it is the despair of neglect and of cowardice. Republicans and Democrats alike shirk the issue, partly for lack of vision or a constructive programme, but always in dread of a prejudice which must be made to yield before the majesty of the laws of the land and of justice itself. Serious authors follow suit to the extent of treating the issue from every other point of view save that of government; they rarely deal with it as a domestic and social problem for which remedies must as certainly be found as for those concerning labor and capital or any others which menace the peace and happiness of the people of the United States. Instead we hear solemnly that the only way out is to govern the inferior race by violence, by defiance of law and order, by the negro's exclusion from a share in government as from its benefits. It is true that we have such helpful and valuable studies as Albert Bushnell Hart's "The Southern South." But the writer has yet to appear who can analyze the situation with that firmness of grasp which is characteristic of Lord Bryce's treatment of most of our difficult problems, and at the same time throw down the gauntlet to our dormant statesmanship.

Dormant it plainly is, for Washington is content either to approach the subject from the unblushing standpoint of prejudice, as illustrated by the scarcely checked effort to segregate the colored employees in the Federal departments and by the familiar Congressional diatribes of the professional negrophobes, or to ignore it; while our Federal courts have been as adept in dodging questions involving fundamental civic rights as our public is blind to the flat and defiant Southern violation of the Constitution. We have had President's commissions to deal with the rural-life problem and farmers' credits and banks. A new bureau concerns itself exclusively with children; and our forests have their especial Federal guardian. But there is no Government agency which devotes itself to studying scientifically the racial problems that have lately driven no less able a foreign observer than Sir Sydney Olivier, for five years Governor of Jamaica, and all his life close to the negro problem, to the belief that this country is again headed straight for civil war unless our responsible statesmen turn squarely about and move in the contrary direction from that which is marked for the wayfarer by disfranchisement, the Jim Crow car, and latterly the establishment of black ghettos in our Southern cities.

And so race friction grows apace, South and North; in the South economic pressure, the upward strivings of blacks and poor whites, the machinations of the pothouse politicians who misgovern them both; the shocking failure to give a real education to the children of the South, and particularly to those of the freedmen; the constant wedging apart of the races in their social life by new restrictive legislation planned, passed, and enforced by the white men to suit their will—these developments are full of menace, since they are conceived by passion and prejudice. Only in some of the Southern colleges is there beginning a movement to find a way out of the terrible morass of hatred and injustice into which both races are sinking.

In the North the influx of colored multitudes finds us less willing, if anything, to give a square deal to the individual than in the South; finds our labor unions bitterly hostile; our cities unready to take them in hand, to render them useful citizens, to mould them to their commercial needs. We shudder at their squalor and then deny them the means of livelihood to rise beyond it; we, too, would restrict their habitat if they depress our land values and so touch our pocket nerve. But to take them up as a burden and as a study, whether we dread, or despise or like them—there are few individuals of us, indeed, who are ready to take the trouble, our invaded municipalities least of all.

II.

But that there is a leaven stirring appears clearly from the volumes before us. The great book is not yet there; we must still wait for a Jacob Riis to touch the public heart on behalf of the black children, big and little, the outcasts who are truly the wards of the nation, but are treated not even like step-children. This group of books does represent a sane and earnest effort to reach the truth from the several standpoints of the writers. From the colored race comes Prof. Kelly Miller's collection of essays, "Out of the House of Bondage." Always well written and full of interesting and valuable facts, Professor Miller's works place him in the small group of foremost colored writers of which the other two are Booker Washington and Du Bois. He speaks invariably with scientific calmness, and it would be difficult to find elsewhere so compact and judicial a story of the negro's rise from slavery as is contained in the essay which gives this volume its title. Professor Miller does not minimize the race's faults in this survey of its wonderful achievements, nor does he dwell long upon its progress as valued in material units. What he does ask is how far the negroes have acquired the capacity "to become not merely recipients but partakers of the life and spirit and power of that civilization of which they would constitute a part." As to that, he admits that they have yet to begin; that most of their energy has been spent in grasping the meaning of knowledge, and that there is little dynamic power left. But Professor Miller looks forward to a wonderful change in this respect during the next fifty years. His is a

cheerful, hopeful note throughout, whether dealing with the negro in politics, or his education, or the present-day weakness of his clergy. He has vision and faith and what few white writers possess—an appreciation of the fact that fifty years of liberty is too short a time in which to pass any final verdict upon a people: "in the economy of racial life a half-century is scarce more than a single year in the experience of an individual." More than that, in his own detachment and his grasp of principles, he shows a breadth that should insure his being one of the first chosen for counsel if the dominant forces in our political life should ever realize that the initial step towards solving the negro problem is to call into partnership the colored leaders themselves.

Mr. John Daniels's study of the Boston negroes, like Miss Ovington's similar inquiry among New York's black people, is precisely the kind of painstaking inquiry into a local problem which must be the basis of sound knowledge of the situation in the North. He has not limited himself wholly to local phenomena, but has given the national background as well, one chapter, for instance, comprising an admirable summary of the Abolition movement in Massachusetts and of the service of the colored soldiers from that State. If the judicial attitude is sometimes lost, as in his discussion of the split among the colored people over the teachings of Booker Washington, to whose side the author clearly leans, there is a great deal that is informatory as to the actual achievements of the colored people in the home of Abolition. He does not always know how to make good use of his material, but he does clearly explain the change in the feeling which has left the Boston public, if not actually hostile, at least indifferent to the colored man. He does not hesitate to set forth the chief weakness of the negro group as a political entity. This is "an inability to subordinate personal and minor differences to an inclusive and effective organization and a general fixed policy" and a tendency "to be jealous and envious of each other's success, to quarrel and to split into continually changing factions"—a truth which adequately accounts for the failure of one national political organization of colored men after another. Yet if Mr. Daniels discovers inherent individual weaknesses which in his opinion render the average Boston negro inferior to the average white man, he is none the less certain that the race has genuine contributions to make to the national life, and ends his book with the hopeful note that in Boston, as in the nation, "this people will eventually attain the position at once of self-respect and of worthy recognition," despite the negro's backwardness and weaknesses and the white man's prejudice.

III.

The three books from Southern sources in the list are full of encouragement because all are sympathetic and not one of them accepts unreservedly the prevailing Southern opinion. Dr. Bailey, a professor in the University of Mississippi, for instance, realizes the need of scientific inquiry upon which I have touched, and dwells upon it most earnestly in the series of papers he has made into a volume. He complains justly that we have not even analyzed what race prejudice really is, and as to the social problem itself he exclaims: "How few are the first-class men that are making this most baffling, distressing, and imminent of human problems the object of devoted and patient scientific investigation." From the Southern contention that all is well with the negro in the South when left to the Southern whites and not interfered with by Northern philanthropists, he strips the lamb's skin to call the negro's situation "a direful tragedy." More than that, he admits frankly that fine as are the Southern white folk, the "situation is too much for them. We cry out strenuously, Let us solve our own problem! But we are not solving it; indeed, the complication of it is growing. . . . So, while we need not cease talking and writing about the negro problem, let us study it in the light of twentieth-century science and Christianity." Since the negro is not getting a fair show, colonization seems to Professor Bailey a possible solution from which the cost will not deter the nation, not even, he thinks, if it should take the price of several Panama Canals. But he sees, of course, that this is not possible in short order to-day, any more than it was when first earnestly urged some seventy years ago in the heat of the Abolition struggle. He admits frankly that immediate and wholesale deportation is "a futile dream" for the present. His hope lies, therefore, in a "parallel civilization for the colored folk." Just what that is to be he knows not, for history shows nothing upon which to base it; he can only urge it as a question for that long-continued scientific study for which his book is a brief. If it contains no other practical suggestion than this, his effort is none the less worth while; for it is, first, the quiet answer which the thinking South is beginning to make to its own demagogues, and, secondly, it is illuminated by the obvious desire to do justice and by his readiness to state truths unpalatable to his section, as, for instance, that "no human question can be regarded as permanently settled when one people remains subordinate to another simply on account of racial differences."

Less satisfactory, though written with more of the scientific spirit and much learning, is the "Democracy and Race Friction" of Prof. John Moffat Mecklin, professor of philosophy in the University of Pittsburgh. It is an attempt to support scientifically the prevailing Southern opinion, to explain Southern inconsistencies and cruelties on the familiar ground of group solidarity, race consciousness, and the intermarriage question. It assumes the negroes to be almost hopelessly immoral and judges them as though their record of fifty years permitted the last word, without a realization, of course, that the negro in the South is precisely what the white man who owned him body and soul in slavery days and now controls him, socially, economically, and politically, has made him. But even he has written a tract which the Southern point of view could hardly have produced fifteen or twenty years ago. Thus, he denounces Mr. Vardaman as the type of demagogue who has made "unscrupulous use" of race antagonism to achieve office and has aggravated conditions so that the races in Mississippi are farther apart than ever. Again, while dwelling always upon the inferiority of the negro race and the theory of group differentiation, and denouncing the intellectual leaders like Du Bois who tell the negro that there is no goal too high for him to aspire to, he none the less writes the following:

It is wiser to admit the negro to all the stimulus and inspiration of the white's social heritage, in so far as this does not endanger the integrity of the social heritage itself, than to encourage an ignorant and debased citizenship by his neglect and repression. It is, of course, entirely obvious that every murder, or lynching bee, or cowardly terrorizing of a weaker race sets free subtle educative sources which react upon both groups. It furnishes "social copy" for the rising generation of blacks and whites which will be built into the fabric of their personalities, brutalizing and barbarizing their own souls and ultimately cheapening the whole tone of the civilization of the future.

But to admit the negro to all the stimulus and inspiration of the white's heritage is surely an extremely dangerous practice for those who believe in having one race up and the other down. In another place he writes that there cannot be the same interpretation of equality before the law for whites and blacks. But if you admit the latter to the stimulus and heritage of the white race, how can you prevent their aspiring to equality before the law upon which the Anglo-Saxon primarily insists? The only safe way is to deny them everything; anything else is equal in folly to keeping the Russian peasants illiterate in order that they may not become enemies of the existing monarchical order. Again, at one place Professor Mecklin asserts that there are "*fundamental* racial differences," and then declares that these are found "only at the lower level of instinct, impulse, and temperament, and do not, therefore, admit of clear definition. . . ."

There are other inconsistencies, and there is plenty to make the knowing smile, as the matter of negro immorality, where, as usual, there is no real appreciation of the guilt of the white man during three centuries. Repeatedly Professor Mecklin shrinks from the logic of his own conclusions; repeatedly his humanity interferes with his argument. He means to be just and kindly and to write without bitterness (though the tone is always one of condescension), and so he is compelled at the end to the conclusion that the thing to do is "to accept the situation as it is, with all the complications arising from segregation and race antipathy, and to

insist upon a stern, even-handed justice based upon equality of consideration"—but, marvellously enough, that is to be done by a varying interpretation of equality before the law! "This implies, of course," Professor Mecklin continues, "that each individual, as well as each racial group, is to be free to find a natural level in society. This implies also competition of the most vigorous and comprehensive nature, industrial, moral, cultural, and even ethnic. It means the elimination of the unfit and the preservation of the fit. Most important of all, it means in the end a healthy and permanent progressive civilization. This is the only effective method history has thus far revealed of testing and preserving that which is ultimately and supremely worth while."

With this Professor Mecklin completes his boxing of the compass, for this, together with absolute equality before the law, is all that the most violent Northern partisans of the negro have ever asked. They demand merely that the negro be freed from injustice and handicaps due to color, in order that he may find his natural level; the negroes, too, have insisted that this is the only way to peace and happiness in the republic. Aspiring colored people will find nothing in Professor Mecklin's book to worry them. Indeed, they may well take courage from it. If this is the best presentation of the old-fashioned anti-negro case that can be made, it is evident that it is losing steadily, being weakened both by its lack of logic and by its conflict with the humanitarian tendency of the age.

The same fine new humanitarian note that runs through these Southern writings is struck even more clearly by Mrs. L. H. Hammond in her "In Black and White." No one can peruse the earnest, moving volume from the pen of this Southern woman without understanding why it is that Northern negrophiles are now looking largely to the South for hope and encouragement. She, too, has found, after years of work, that the need is to ascertain and to face the facts. As Dr. James H. Dillard has put it in his introduction to her volume: "The problem of the South to-day is how to find voices and hearings for her best thoughts and sentiments." Behind all the cant and hypocrisy of the demagogues, behind all the cowardice of legislators, clergy, and public men, and the horrors of the mob, there is a stirring of conscience in the South and a growing realization that the white men and women of that section are not doing justice in their treatment of the colored people. How soon will it find potent voice? How soon will the terrorism of public opinion cease to dominate the liberal spirits who must in any such undertaking face abuse and ostracism, if needs be, because they can no longer hold back the truth? Upon the answer to that question depends largely the progress this country will make towards a solution of the problem. One of the leading Southerners in public life to-day, who years ago came North to breathe a freer air, tells of returning to his former home and spending a long evening with old comrades, the leading citizens of the town, in a discussion—the inevitable discussion—of the negro. He found to his satisfaction that they held his own radical, for the South rather revolutionary, views, and as he rose to go he said: "Now, boys, I have got clearly in mind all that you have said, and I shall publish it to-morrow." There was a wild rush for him. "By heavens, Smith," they cried in unison, "you shall not leave this room alive unless you swear to do nothing of the kind." He promised, of course; and his playmates of boyhood days continue to suppress their real thoughts and bow down to the God of things as they are.

How much longer is this padlocking of the lips to continue? Not long, if we may judge by Mrs. Hammond's book, in which one finds, as in the frank and noble utterances of the speakers at the recent Southern Sociological Congress, a readiness to come out and tell of things as they exist, and not as they appear to the eyes of multitudes who think to see what they would have. It is a plain, homely volume, full of happy illustrations and a clear understanding of human nature, breathing a spirit of good will towards everybody, and distinguished by true religious feeling. Her kindliness towards the negro and keen appreciation of what is good in him recalls the philosophy and the rare understanding of negro nature which marks "Ezekiel"—the sympathetic child creation of a Northern woman, Miss Lucy Pratt, which valuable book, it is pleasant to note, is now being reissued, for a large sale, we hope, to young and old, by Messrs. Houghton Mifflin, of Boston. Mrs. Hammond's insight and philosophy enable her to say: "The only basis for living between man and man, whether low or high, which is safe for either is justice." And she is keen to see that where there is less than justice the danger is ever greater for the oppressor than for the oppressed. The time will soon come when utterances like these will be a commonplace from the South. They are notable now, from a white source, as is this wise and noble sentiment:

> My only fear for white supremacy is that we should prove unworthy of it. If we fail there, we shall pass. Supremacy is for service. It is suicide to thrust other races back from the good which we hold in trust for humanity. For him who would be the greatest the price is still that he shall be the servant of all.

Therein lies much of the philosophy of the problem; that it is coming to be taught in the section which fifty-six years ago was locking up in penitentiaries white women who dared to instruct negroes how to read and write, is a happening to cheer the most pessimistic. One must be blind indeed not to see, despite surface discouragements and friction in many places, which way the deep, underlying current is setting.

If the books that are being put forth leave no doubt about the new humanitarian note in the South, this only emphasizes again the necessity for the country's administrators to busy themselves more about it and to grapple with it as a national problem.

Poetry

A POET OF BELGIANS—EMILE VERHAEREN.

PARIS, November 16.

There has been talk lately of electing Maurice Maeterlinck to a seat in the French Academy. It would certainly be the highest testimonial of esteem and sympathy which intellectual France could offer to Belgians in their national affliction; but it is without precedent and perhaps impossible, since the French Academy, of its essence, is for French Immortals. Maeterlinck asks that, if any honor is to be done, it should go to an older and, he adds modestly, to a better man—Emile Verhaeren. "Any writer with patience enough can do my prose, but not Verhaeren's inspired poems."

Verhaeren, beyond doubt, fulfils the tradition that discerns a divine spark in the true poet—*sacer vates.*

> The complaining millions of men
> Darken in labor and pain;
> But he was a priest to us all
> Of the wonder and bloom of the world,
> Which we saw with his eyes, and were glad.

He has lived to write in plain prose, more tragical than any verse, the present dark hours of "Bleeding Belgium." But, from the beginning, his whole poetic work has been to make known the labor and pain, the wonder and bloom of the world of Belgians. It is in the cruel revenges of time that Stefan Zweig* should have pronounced: "Verhaeren is to-day part and parcel of German culture; and much of our contemporary lyric poetry, its welcome turning to optimism, for example, would be unthinkable but for his work and influence!"

By Goldsmith's "lazy" Scheldt, not far from Antwerp, Emile Verhaeren was born nearly sixty years ago in the plain-lands which he has painted in strong verse feebly rendered by these literal lines:

> Round the least village where the bell-tower,
> Tufted with its gilt weathercock and shining
> with slates,
> Grows up over houses a few yards high—
> Close to a fishing town, close to a gardening
> town—
> Here where the dikes quick bar the sight,
> There were black oxen low in the earth-
> mould,
> And further where a sail half-seen
> And red on a background transparent, enam-
> elled,
> Hints of waves and the morning song
> Of boatmen making for the open and the river
> Slashed by the sun-rays' swords of gold—
> Everywhere—be it flax-field or oat-field,
> Corner of rye or clover square or meadow
> wedge—
> Everywhere, to beyond the purpled horizon—
> The green immensity of plains and plains!

And that, till present waste and ruin, was Flemish land—*Toute la Flandre*, with its "garland of downs" in Verhaeren's volumes. After the wont of its *bourgeois* fam-

*Verhaeren. By Stefan Zweig. Boston: Houghton Mifflin Company. $2 net.

ilies, his speech from the beginning was French and he has uttered Flanders in verse genuinely French, though racy of the natal soil. For his training in letters he was sent to the Jesuits' College in Ghent, where another poet articulate of Belgium—kindly Georges Rodenbach, who disappeared too soon in the full success of Paris—sat with him on the benches, and where, a little later, came that early-dying genius, Charles Van Lerberghe, and Grégoire Le Roy, and Maurice Maeterlinck. Of these Verhaeren has said: "Their sadness and gentleness, their subtle feeling and talent fed on memories and tenderness and silence, wove a wreath of pale violets round the forehead of Flanders."

Verhaeren's colors were robuster, as appeared when his "Flamandes" ("Flemish Women") exploded in 1883 on the little old-fogy world of Belgium. He had finished some time before his five years of law at Louvain, the university now burned by hordes of culture. The light-hearted journal which he published with student comrades—"the four greatest poets of the epoch"—had been suppressed by the University authorities. Zola was writing of "Earth," of whose delving he had not man's experience; and an apparent likeness of method fixed on the new poet the discredited label of Naturalism. Camille Lemounier, who led the feared school, came to his defence; but the friends best able to plead in his favor could say little more to the accusation of *impudeur massive* than to hail in him a *tempérament*. Among his own tumultuous verses he inserted an aggressive Apologia in the name of "Flemish Art":

> Your brushes knew not face-paint,
> Indecencies and naughty pranks,
> Things understood of vices
> That wink the eye in Art to-day.
> . . . . . .
> In the splendor of landscapes
> And gold-panelled palaces,
> In purple and ornament
> Sumptuous from the antique age,
>
> Your women reeked with health,
> Red-blooded and white with fat,
> And they led the rout in leash
> With airs of royalty.

Ruskin had his own opinion of Flemish art, as he explained freely. Without prejudice, in this early period, Verhaeren is surely excessive. He looked too confidingly at his Flemish "Old Masters":

In smoky dives where hams are hung,
Black sausages, candles and bladders,
Clusters of partridges, clusters of turkeys,
Enormous strings of stuffed fowls
Spotting with their pink flesh the black ceiling's corner—
In a circle, round meats heaped on the table,
Blood following the fork in their flank on the platter—
All these whom gluttony seats heavily at table,
Craesbeke, Brakenburgh, Teniers, Dusart, Brauwer,
With Steen biggest and drunkenest in the middle,
Gather, chins dripping, vest open,
Mouths full of laughter, bellies full of pork.

It is unsafe to transpose Art into Life, and the three appetites to which Goethe limited man in his "Xenien" are never all man. Verhaeren, in these last days, has had cruel proof of his early misjudgment of "The Peasants":

Men of the plough, so mawkish made by Greuze
In the soft colors of his peasantries,
So clean of dress, so ruddy-white that 'tis
A pattern gay to see 'mid gingerbread
Of Louis Quinze salons, making pastels alive—
Look at them here, black, coarse, and animals—such they are.
. . . . . .
Their country? Come now? Who among them believes in it?

Bleeding, wandering Belgium answers, after thirty years, for the Flemish peasants. The inexperienced poet, like Zola for the French, has simply verified another of Goethe's penetrating criticisms of Man as he lives:

> Shrewd Sir Philistine sees things so,
> Who all his life on the outside passes.

Ever since, half of Verhaeren's poetry has been a refutation of his younger excess. Within three years' time, he brought out his first Paris volume—poems on "The Monks." He had wandered often in his childhood through the cloisters of a near-by monastery of St. Bernard; and it is said he returned for a "retreat" in gestation of these verses which, indeed, might not shock their subjects, but would leave all sorts of spiritual reserves to—these white-robed guardians of Christian thoughts,
Who stay at sunset brooding o'er the world.
. . . . . .
From what horizons dark, from what far lands of gold
Do you run to the cloister's threshold, dry and dun,
Great Christian ascetics, who alone still hold,
Upright, your dead God over the modern world?

From a short notice like this, the winding course of the poet's changing art could not be understood. By 1890, he was plunging his readers in "Novembral seas," not unlike those in which Nietzsche drowned and which were perhaps only the fog of the great world-city whose pave he was beating:

O my evening soul, this black London dragging through thee!

With the years came quiet—which is a manner of speaking—with successive volumes of such verse as "Hallucinated Countrysides," "Illusory Villages," "Tentacular Cities." Belgians woke up to find they had a poet, in some ways the greatest since Victor Hugo. And, amid their celebrating him, he kept on in a renewed art that deals with little people—miller and bell-ringer and blacksmith and the cord-maker in Flemish fields. So it has gone on, through many volumes, intenser, deeper, in spite of frequent volcanic titles—"Tumultuous Forces" and "Multiple Splendor." And, with others still, there are the four crowning volumes of "All Flanders"—tender, melancholic, heroic—and a play which is rather a poem of "Philip the Second," who also knew Flemings.

Here is the poet's outlook on "The Poor" in the later book—"Faces of Life":

Thus are poor hearts—with lakes of tears within them,
Pale like the tombstones—of a cemetery.

Thus are poor shoulders—weighted more with toil and burdens
Than roofs of brown hovels—amid the downs.

Thus are poor hands—like leaves on the roads,
Like leaves dead and yellow—in front of the door.

Thus are poor eyes—lowly, kind, and heedful,
Sadder than animal's eyes—under the storm.

Thus are poor folk—weary of gesture, indulgent,
And Want gnaws fiercely at them—all along Earth's plains.

Still, Verhaeren's poetry looks onward "To the Future":

O race of man, bound to the golden stars,
Hast thou felt the fearful, beating travail
That sudden, since a hundred years,
Shakes thine unmeasured strength?

And elsewhere:

Vast hope, from the unknown, displaces
The old balance which our souls have loathed;
Nature seems to be carving
A new face for her eternity.

Now, at the last, his thought has become precise:

Since thou art raging, devastating war,
How virginal and beautiful again the words
Of peace and liberty, of right and justice!

Book Notes and Byways

THE "TRUCE OF GOD."

(Some Christmas Parallels.)

The time draws near the birth of Christ,

and inevitably we think of the Magi and the Star. Something marks off this day from other days. However much the distance between us and the church has widened, however unorthodox we may be, the old story keeps its spell. Of whatever creed or shade of faith, we recognize in this season the distinctive anniversary of the founding of our civilization. "Cette obscure clarté qui tombe des étoiles," that pale light which fell from the star which, in the story, the shepherds followed, marks the end and the beginning of our Christian year. So it has been for centuries, and so many men had fondly hoped that it would be for generations who shall call this time ancient, "Che questo tempo chiameranno antico," as Dante says.

Is it still possible, even for those by nature inclined to do so, to read the old message in the old way? Civilization has indeed withstood the shock of many a war and many an invasion, yet it is undoubtedly true that we have now set up a sign-post on the road towards the future. The year that has passed has been a serious year for thinking men. Its events have challenged our entire civilization and somewhat more than other men are we, of the universities, indicted when our civilization is condemned. A single analogy proves nothing, to be sure, or a single contrast, but perhaps an historical incident will help to show us the way that we are going.

With deep regret the head of the Catholic Church has uttered his "non possumus." We are told that the fighting in the trenches and over the Polish marshes must go on. In what our historians have taught us to call the Dark Ages, there were times when a hush fell over battles and when in the midst of fiercest conflict man's nobler spirit called a pause. Nor was this mere complacent pacifism; it was in the day of wars and fighting bishops, between the times of Hildebrand and Turpin. Yet for a few brief days, at least, during the "Truce of God," no sword was lifted, and a little space to gather the harvest or to observe with due solemnity some sacred anniversary was covered by inviolable peace. How the apologists have attacked the pagan Romans who fell upon the Christian Alaric when he and his warring Goths paused to worship and dreamed themselves secure under the special sanctity of Easter! Let us recall that the Council of Toulouges, in 1041, ordered that all wars be suspended during holidays and Sundays, during Advent and Lent, and during the second half of each week. It has sometimes been held that this was quite ineffective. Such can hardly have been the case, for fifty-four years later the order was confirmed and extended to all Christian countries by that Council of Clermont which decreed the first crusade. An entirely ineffectual decree would hardly have been thus extended.

Have we changed since the days of Alaric the Goth? In such matters "When in doubt, read Gibbon," is an excellent rule. He cites as a particularly illuminating incident in those unhappy times, the fate of an aged Veronese in the year 400:

"The old man, who had passed his simple and innocent life in the neighborhood of Verona, was a stranger to the quarrels both of kings and bishops; his pleasures, his desires, his knowledge, were confined within the little circle of his paternal farm; and a staff supported his aged steps, on the same ground where he had sported in his infancy. Yet even this humble and rustic felicity (which Claudian describes with so much truth and feeling) was still exposed to the undistinguishing rage of war. His trees, his old *contemporary* trees, must blaze in the conflagration of the whole country; a detachment of Gothic cavalry might sweep away his cottage and his family; and the power of Alaric could destroy this happiness, which he was not able either to taste or to bestow."

If we read Lodz or Dixmude for Verona, and Poland or Belgium for Italy, in what way do they differ?

"Fame," says the poet, "encircling with terror her gloomy wings, proclaimed the march of the Barbarian army." To-day we are told that it is not fame but fate. In spelling the difference is slight, and it may be that in sense, too, the difference is merely on the surface. It may be that the fame of one is the fate of another.

But to-day no truce shall fall, and yet men who sat with us on college benches are at the front and more are helping to bring the wounded from their trenches to their beds. How shall we make answer? What shall we say? We, who are more deeply involved in, and more narrowly responsible for, the spiritual tides of our time? Is this any serious index of change? Or in our softness are we too easily shocked? In any case let us face the facts. Can there be any such thing as a permanent "peace with honor"? If so, under what moral dispensation? If not, and if we must fight, let us prepare ourselves to fight well. Can we still think with old Sir Thomas Browne that man is a "noble animal, splendid in ashes and pompous in the grave," or must we look upon him as the "blond beast" of a later school; can we still believe with as naïve a faith those other lines of a poet whom the schools expound:

> "God's in his Heaven
> All's right with the world"?

It may be that our own human power is very slight, that in the world's way (which is perhaps not "good") it is not at all decisive; that, after all, as the mystic said, "God swings the earth like a trinket from his wrist"; it may be that we are again under the sway of another ἀνάγκη, of a fate that rules not only the destiny of individuals, but a new ἀνάγκη which presides inexorably over the destiny of nations. The view has been offered for our consideration by colleagues from over-sea. For all the sombre grandeur in which this new conception is framed, and for all its ancient sanction, may it not be that it is merely the last infirmity of not quite noble minds who, finding themselves in a position for which, under existing moral sanctions, there is no excuse, and before the world, no justification, are merely taking refuge in an outworn academic form to ask us to stop thinking—in order that we may agree with them? This cowering attitude towards fate is either justified by the way of the world and we must stop blithering about morals, or it is false and we must pass judgment and speak our minds like men.

No Christmas bells shall this year ring good will and peace for Poland or for Belgium. Shall the rest be silence? Under the spur of our necessity in these morally dark days surely we have need of honest thinking, of some new message, or some unequivocal reaffirmation of the old. A new generation cannot grow up to manhood in this silence and in this moral neutrality which is merely another name for moral cowardice. We need not take sides for one nation as against another, but if fate is not the *ultima ratio mundi*, principles must be involved, and we must take sides for one principle as against another. When some half million of our fellow-Christians (and some Turks) have been slaughtered; when ten or fifteen millions are homeless and facing famine; when almost every day some battleship is sent to the bottom with her thousand "souls," as we might sink rubble in a caisson, the silence of a Christian nation begins to look like moral bankruptcy. We need not despair of civilization if some millions have violated a principle, if disinterested men still have the courage at least publicly to affirm it; but this silence is suffocating. "While Boethius," we are told, "oppressed with fetters, expected each moment the sentence or the stroke of death, he composed in the Tower of Pavia, the 'Consolation of Philosophy'; a golden volume, not unworthy of the leisure of Plato or Tully, but which claims incomparable merit from the barbarism of the times and the situation of the author." How much nobler was the attitude of this Roman of the Decadence; and how much nobler was the spirit of that free-thinking Condorcet who, knowing that he was himself to be led to the guillotine, yet spent his last days in writing his "History of Human Progress" and in extolling the true principles of that misguided Revolution, of which he was himself the victim!

CHRISTIAN GAUSS.

Princeton, N. J.

Correspondence

"DEUTSCHLAND UEBER ALLES."

TO THE EDITOR OF THE NATION:

SIR: Professor Schuetze bitterly complains, in the current *Nation*, of Mr. Galsworthy's "mistranslation" of "Deutschland über Alles" into "Germany above everything." He says: "Mr. Galsworthy distorts into a jingo slogan an innocent avowal of loyalty to country. The meaning of the line is: 'Germany, Germany, dear to me above all things.'" That may be Professor Schuetze's meaning when he sings "Deutschland über Alles," but that it is implicit in the line itself can scarcely be maintained.

Professor Schuetze should reserve some of his indignation for Dr. Bernhard Dernburg, who also translates the same line for the benefit of the readers of the *Saturday Evening Post* (November 21) as "Germany above everything."

Is it possible that, to the German mind, Dernburg is right and Galsworthy wrong? It may be so. For four long months the mental processes, not only of the warriors, heroes, and War Lords of Germany, but also those of her statesmen, philosophers, and theologians, have been the object of unadmiring astonishment to the rest of the civilized world.

Professor Schuetze should turn his attention, while he is on the subject of mistranslations, to Dr. Dernburg's rendering into English—again for the benefit of Americans—of the succeeding line of the same stanza. The "Schutz und Trutz" for which "her sons ever stand united" Dr. Dernburg translates: "Defence and Protection." Is there the slightest authority for softening "Trutz" into "protection"? Would not "Defence and Defiance" be more in accord with both the root significance and the actual every-day meaning of "Trutz"? Is not, for example, a "Trutz- und Schutz-Bündniss" an "offensive and defensive alliance"? There could be no valid objection to Germany's singing about this, but why try to deceive us as to the meaning of her song?

Is it possible that the more accurate translation did not sufficiently harmonize with Dr. Dernburg's description of "Deutschland über Alles" as "a song of modesty"?

One may indeed be defiant when on the defensive, and even Modesty, when outraged, may not only "blush like scarlet," but also have "defiance in her eye." But the picture of a shy, shrinking, blushing Germany singing "Deutschland über Alles" as, armed to the teeth, she desolates Belgium; or even as, more peaceably, she practices the goose-step in the presence of her Generals and Field-Marshals, seems to have elements of psychological confusion. Possibly, Professor Münsterberg will help us.

A convention of the German and German-American apologists for the purpose of deciding upon authorized versions of German songs and speeches should be held at once. After that, perhaps, we should not find that the Imperial Chancellor's speech to the Reichstag had been "mistranslated," and that, as Dr. Dernburg has discovered, he—the Chancellor—never dreamed of admitting that by the invasion of Belgium any "wrong" had been done. He was thought to have said this, and, indeed, by his silence under

world-wide criticism, would seem to have thought so himself. Now, Dr. Dernburg tells us that all he meant to say was that "the neutrality of Belgium could not be respected." Nor would we have our Department of State officially announcing that Germany had, in a communication, denied the "intention" to "seek expansion in South America," while Dr. Dernburg transforms the same document into a "solemn declaration . . . fully to respect the Monroe Doctrine."

It would be easy but wearisome to cite many more examples of the obvious and rather clumsy attempts of the German protagonists to prepare their output for a supposed American market. On their wares the customary label, "Made in Germany," might now well be replaced by one reading: "Made for America."

J. William White.

Philadelphia, December 9.

THE GENTLENESS OF WAR.

To the Editor of The Nation:

Sir: It is a pity that German apologists, writing to enlist the sympathy of Americans, can never be brought to appreciate the value of an understatement. If they would assert a little less, we could believe a great deal more. If they did not whitewash so vigorously, we should not suspect so much dirt. Herr Heinrich Friedrich Albert has contributed to the December issue of the *Atlantic Monthly* a paper on "German Methods of Conducting the War," in which he points out blandly that war, so conducted, far from resembling Hell, is a pretty close approach to Heaven. The Prussian soldier, as painted by Herr Albert, is what old-fashioned people used to call "too good for earth." Shelley's apostrophe to Emilia Viviani,

Seraph of Heaven! too gentle to be human,

is the only description which can be found to fit him.

Of course, all charges of cruelty are swept aside as of "psychopathic origin." Herr Albert wastes no time on *them*, but proceeds at once to make clear to us the benignant nature of Zeppelins and airships, which are far more "humane" than artillery, and which, by compelling the speedy surrender of a fortress, "may spare many thousands of lives, and property of incalculable value." Even when the bombs are dropped upon cities not under siege, "a calm and judicious consideration" will soften our prejudice against them. They were never intended, for example, to destroy life in Paris. "The bombs were meant for the wireless station on the Eiffel Tower." If the inconspicuous nature of the Tower concealed it from observation, the blame, we presume, rests with the French, who should have built it higher.

As for the burning of Louvain, Herr Albert clears the invading troops of all responsibility, and practically of all participation in the deed. He does not even admit, with those delightful German professors who put forth their appeal, "To the Civilized World," that German soldiers "with aching hearts were obliged to fire a part of the town"— a purely academic view of militarism. Herr Albert's soldiers behaved better than that. All they tried to do (and who can blame them?) was to defend themselves against the furious attack of Louvain civilians. When, "during this fighting *fires broke out* which spread with terrific speed over the city," they risked their lives to rescue the Town Hall, and "works of art endangered by the flames." All this time the Louvainers, indifferent to the fate of their city, fired "incessantly" at the brave men engaged in the work of preservation. "Unfortunately, it was not found possible to save the valuable library of the University."

What a picture of magnanimity! Nothing like it in history. Nothing much like it in fiction. Why not accept the simpler statement of a patriotic German editor who announced that the Belgians, instigated by the English, burned Louvain, in order to "foul the fair name of Germany"?

The levying of indemnities is another point "much misunderstood." The practice seems at first sight an unkind one, and there are some troublesome Hague regulations, which, if respected, would spoil all a conqueror's sport. But Herr Albert assures us that these huge sums are demanded "to discourage sniping, and for the administration of occupied territory." They are in the nature of ordinary taxes. True, no dollar of them has been wasted so far in feeding the starving or sheltering the homeless Belgians. This evidently does not come within the province of practical administration. But, if Belgians starve, the fault (and this we never should have suspected) lies at the door of England. "There seem to be plans under consideration by the German Government to feed the Belgian population by importing foodstuffs," says Herr Albert vaguely; and these nebulous plans are in danger of being frustrated by England's wicked efforts to seize such foodstuffs as contraband of war. How can kind-hearted Germany feed innocent Belgium when England stays her hand?

The destruction of the Cathedral of Rheims is the episode which of all others we have least understood, and this is because we were, many of us, ignorant of the amazing circumstance which made such destruction "a military necessity." We are ignorant no longer. A German official report, quoted at length by Herr Albert, states that the Commander-in-Chief gave orders to spare the Cathedral, "so long as the enemy refrained from using it to his advantage." The French, thinking to profit by such forbearance, dispatched "a military observer" to the roof. This observer, unlike the Eiffel Tower, was visible from afar. "It was necessary to dislodge him," and by the time he was dislodged—though the firing then ceased instantly—the Cathedral was in ruins. It sounds like a locomotive running over an ant. The roof—with that tendency to spontaneous combustion which marks the propinquity of German troops—"burst into flames"; "but the responsibility rests with the enemy, who attempted to misuse a monument of architectural art under the protection of the white flag."

So far the report. Then follows a priceless sentence of Herr Albert's very own: "For a German, the fact that an official communication is issued by the army headquarters is proof sufficient of its absolute truth to facts."

This is sublime. When I was a little girl at a convent school, another little girl, of Quaker parentage and an agnostic turn of mind, told the good old lay sister who was mending our clothes that she did not believe she was born in sin. "Don't believe you were born in sin!" said the scandalized nun. "But, my dear child, the catechism says so."

Apparently "official communications" are a German's catechism. He offers them to free-thinking Americans with all the assurance of Prester John expatiating on the qualities of his countrymen. "No vice is tolerated in our midst, and with us no one lies."

Philadelphia, November 30.

THE NEUTRALITY OF BELGIUM.

To the Editor of The Nation:

Sir: A friend of mine recently expressed doubt whether Germany had violated any treaty in which she promised to respect the neutrality of Belgium, and then referred to a paper which he afterwards lent to me. It is the fourth number of the *Vital Issue*, published in New York, and contains an article: "Belgian Neutrality; Its Real Meaning. Why the German Chancellor Called the Neutrality Guarantee a 'Scrap of Paper.' Histories of Various Treaties. By Prof. John W. Burgess, of Columbia University, New York." The article is in the form of a signed communication, dated September 11, 1914.

"So much has been said about 'Belgian neutrality,' so much assumed, and it has been spoken of as such a sacred thing, that it may be well to examine the basis of it and get an exact idea of its scope. It is not a moral question. It is a question of truth." The author alludes to the treaty between Belgium and Holland in 1839, and declares that "it is in this treaty that the original pledge of Belgian neutrality is to be found"; that the agreement was approved and adopted by Prussia and the other Powers who signed the Quintuple Treaty on the same day; and that a little later the second treaty was ratified by the German Confederation, of which Prussia and Austria were members. Then, in 1866, the German Confederation was dissolved by the war between Austria and Prussia, and in the following year was formed the North German Union, of which Prussia was the largest state. "Did these changes abrogate the guarantee of the Treaty of 1839," he asks, "or make it obsolete?" The test, he says, came in 1870, when British statesmen had so much doubt that they procured from the North German Union and from France separate but identical treaties "guaranteeing the neutrality of Belgium during the period of the war between France and the North German Union (the so-called Franco-Prussian War), which had just broken out, and for one year from the date of its close." "These treaties expired in the year 1872, and the present German Empire has never signed any treaty guaranteeing the neutrality of Belgium. . . . Perhaps we may now somewhat more clearly understand, why the German Chancellor referred to the guarantee of Belgian neutrality as a 'scrap of paper.'" I propose to examine these statements.

The neutralization of Belgium dates from the treaty of November 15, 1831, of which article 7 asserts, "La Belgique, dans les limites indiquées aux articles 1, 2, et 4, formera un Etat indépendant et perpétuellement neutre. Elle sera tenue d'observer cette même neutralité envers tous les autres Etats." And article 25: "Les cours d'Autriche, de France, de la Grande Bretagne, de Prusse

et de Russie, garantissent à Sa Majesté le Roi des Belges l'exécution de tous les articles qui précèdent." (Martens, "Nouveau Recueil de Traités," xi 394, 404.) By the Treaty of London, April 19, 1839, Holland agreed to the independence of Belgium, and article 7 was repeated without change: "La Belgique, dans les limites indiquées aux articles 1, 2, et 4, formera un Etat indépendant et perpétuellement neutre. Elle sera tenue d'observer cette même neutralité envers tous les autres Etats." On the same day the five great Powers signed the Quintuple Treaty, by the second article of which the treaty of 1831 was annulled, but in whose first article the treaty between Belgium and Holland, including, of course, the guarantee in article 7, was declared to have the same force as if it had been inserted in the Quintuple Treaty; so that the independence and neutrality of Belgium were again guaranteed by the contracting parties. (*Ibid.*, xvi, 777, 788-790.)

In 1870, the shadow of war, and the knowledge of previous diplomatic intrigues between Benedetti and Bismarck concerning Belgium, caused Gladstone to seek for temporary but particular recognition of Belgian neutrality, and assurance that it would be respected. (Morley, "Life of Gladstone," ii, 340, 341.) On August 9, 1870, a treaty was signed at London between Great Britain and Prussia in which the guarantee of the treaty of 1839 was formally acknowledged by the two parties. "Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, and His Majesty the King of Prussia, being desirous at the present time of recording in a solemn Act their fixed determination to maintain the independence and neutrality of Belgium, as provided in the Seventh Article of the Treaty signed at London on the 19th of April, 1839, between Belgium and the Netherlands, which Article was declared by the Quintuple Treaty of 1839 to be considered as having the same force and value as if textually inserted in the said Quintuple Treaty, their said Majesties have determined to conclude between Themselves a separate Treaty, which, without impairing or invalidating the conditions of the said Quintuple Treaty, shall be subsidiary and accessory to it." Prussia then promised to respect the neutrality of Belgium, so long as it should be respected by France, and England undertook to coöperate in the defence of this neutrality in the event of it being violated by France. "This Treaty shall be binding on the High Contracting Parties during the continuance of the present war between the North German Confederation and France, and for twelve months after the ratification of any Treaty of Peace concluded between those Parties; and on the expiration of that time the independence and neutrality of Belgium will, so far as the High Contracting Parties are respectively concerned, continue to rest as heretofore on the 1st Article of the Quintuple Treaty of the 19th of April, 1839." (Martens, xix, 591-593.)

Under wrong date Professor Burgess quotes an observation made by Gladstone in 1870, for the purpose of showing that this statesman doubted whether the Treaty of 1839 was binding upon Prussia or upon the North German Confederation, but the context makes it dubious whether anything of the kind was meant. Nor does the author allude to numerous other expressions during these days which would invalidate his contention. During the debates in the British Parliament on the proposed treaty, objection was made that the Treaty of 1839 gave ample guarantee, and was binding upon Prussia, as well as the other contracting parties, but that an additional agreement might be construed to weaken the original one. With respect to this, Earl Granville declared in the House of Lords: "As to this instrument in the slightest degree weakening the effect of the previous Treaty of 1839, I entirely deny it. There is an express reservation of that Treaty." (3 "Parliamentary Debates," cciii, 1757.) On the same day Gladstone in the Commons said: "The Treaty of 1839 loses nothing of its force even during the existence of this present treaty. There is no derogation from it whatever. The Treaty of 1839 includes terms which are expressly included in the present instrument, lest by any chance it should be said that, in consequence of the existence of this instrument, the Treaty of 1839 had been injured or impaired. That would have been a mere opinion; but it is an opinion which we thought fit to provide against." (*Ibid.*, col. 1789.) He had already asserted that, after the lapse of the proposed treaty, "the two belligerent Powers . . . being parties to the Treaty of 1839 shall fall back upon the obligations they took upon themselves under that treaty." (*Ibid.*, col. 1700.) A fortnight before, Bismarck writing to the Belgian Minister at Berlin had said: "J'ai l'honneur de vous donner par écrit la déclaration, surabondante en présence des Traités en vigueur, que la Confédération du Nord et ses alliés respecteront la neutralité de la Belgique, bien entendu qu'elle sera respectée par l'autre partie belligérante." ("Archives Diplomatiques, 1871-1872, i, 244.)

If Professor Burgess has been correctly quoted, I cannot see that he has made proper representation of the facts. In so far as he upholds his contention that Prussia as part of the North German Confederation was not bound by the Quintuple Treaty, he does so by paraphrasing the Treaty of 1870, and he is able to do so only by omitting a preceding portion of the treaty which would invalidate his argument, while that which he does use is separated merely by a semicolon from following clauses which would demolish his contention altogether. So far as Prussia was concerned there was evidently not recognized either in Germany or elsewhere any lapse of the Treaty of 1839, resulting from the fact that Prussia had entered the North German Confederation. The Treaty of 1870 was not made in order to secure the guarantee of the North German Confederation, but because England was anxious then, as she was in 1914, to obtain assurance that Belgium's neutrality would be respected by those who had promised to respect it. Such assurance the King of Prussia gave for Prussia, recognizing at the same time the validity of the Treaty of 1839. And the validity of this treaty was not supposed to be weakened by the Treaty of 1870, since at the expiration of the latter engagement the earlier one was to remain in force, as it continued to be in the meantime.

It must be said that certain difficulties arise in the theory of international law as to state succession and transitory treaties, but, since Professor Burgess neither rests his argument upon them nor attempts to deal with them, I shall not discuss them in this place. I am not certain that the preponderance of opinion on the part of writers upon international law could be in favor of that which he suggests; but in any event there would seem to be little doubt that the world, including Germany herself, believed that Germany was in honor and, by treaty, bound to respect the neutrality of Belgium, if not to uphold it. In 1909, answering a question in the Commons whether England was still under obligation to maintain the integrity of Belgium, the Under-Secretary of State for Foreign Affairs replied that "the treaties signed in London on 19th April, 1839, under which Great Britain, together with Austria, France, Prussia, and Russia, guarantee the independence and neutrality of Belgium are still in force." ("Parliamentary Debates," 1909, ii, 323.)

The Germans themselves made no such defence as that proposed by Professor Burgess. The Imperial Chancellor von Bethmann Hollweg said in the Reichstag: "Wir sind jetzt in der Notwehr, und Not kennt kein Gebot! Unsere Truppen haben Luxemburg besetzt, vielleicht auch schon belgisches Gebiet betreten müssen. Das widerspricht den Geboten des Völkerrechts. Die französische Regierung hat zwar in Brüssel erklärt, die Neutralität Belgiens respektieren zu wollen, so lange sie die Gegner respektieren. Wir wuszten aber, dasz Frankreich zum Einfall bereit stand. Frankreich konnte warten, wir aber nicht, und ein französischer Einfall in unsere Flanke am Unterrhein hätte verhängnisvoll werden können. So waren wir gezwungen, uns über die Proteste der luxemburgischen und belgischen Regierung hinwegzusetzen." (*Berliner Tageblatt*, August 5, 1914.) The Chancellor, as had been the case with Bernhardi, resorted to that plea of ultimate necessity which international jurisprudence recognizes but hesitates to define.

A correspondent writing in the *Vital Issue* says: "Germany has been particularly unfortunate in her diplomacy, and the expressions of her Chancellor in respect to the violation of Belgian neutrality have lost Germany the very general sympathy of this country." His letter is written from Toledo, Ohio. To this communication "The Editor" appends a note: "This gentleman (a Canadian, we hear) will probably be glad to see the 'new light' of this number on the supposed 'violation of Belgian neutrality.' Is it not remarkable how the public has been imposed upon?"

And, turning again to the beginning of the article, I observe that immediately under the title, and immediately over Professor Burgess's name, the editor has placed another note, which concludes: "In spite of the immense difficulties this paper will continue to throw a true light on the present European crisis."

EDWARD RAYMOND TURNER.

Ann Arbor, Mich., November 30.

THE NAVY LEAGUE.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent who savagely attacks the Navy League acknowledges that the League expressly stated, in sending out the pamphlet "God's Test by War," that it did not endorse all its sentiments. The League leaves something to the discrimination of readers, not to speak of their fairness. But, leaving aside the wisdom of distributing this

or that pamphlet, it is no more than just to point out that the Navy League is an out-and-out peace organization, but that it stands for the peace of righteousness. It heartily welcomes every sane effort towards peace, and is glad to coöperate with it. The League is by no means a club of naval officers, but of civilians, though some officers are very naturally members. It is in no manner subventioned by manufacturers of arms and armor, but is wholly supported by voluntary subscriptions. It simply believes that, until the millennium comes, and recent events seem to prove that it will not arrive for a while yet, it is the part of a wise nation to insure against war by keeping the fleet strong and efficient. And it would appear, from a study of the American press, that the country at large is rapidly coming to acquiesce in the wisdom of this policy.

EDWARD BRECK.

Washington, D. C., November 30.

AN HISTORICAL PARALLEL.

TO THE EDITOR OF THE NATION:

SIR: May I add yet another instance to the growing list of allusions made by ancient writers to the present war? Diodorus XII. 13, apropos of the legislation of Charondas, ventures the following reflections, which might perhaps, in view of the clear reference involved in φιλοσοφία καὶ πᾶσα παιδεία, be entitled "Of the Relation of Treaties to Kultur": τίς γὰρ ἂν ἄξιον ἐγκώμιον διάθοιτο τῆς τῶν γραμμάτων μαθήσεως; . . . ταῖς τε κατὰ πόλεμον συνθήκαις ἐν ἔθνεσιν ἢ βασιλεῦσι πρὸς διαμονὴν τῶν ὁμολογιῶν ἢ διὰ τῶν γραμμάτων ἀσφάλεια βεβαιοτάτην ἔχει πίστιν· καθόλου δὲ τὰς χαριεστάτας τῶν φρονίμων ἀνδρῶν ἀποφάσεις καὶ θεῶν χρησμούς, ἔτι δὲ φιλοσοφίαν καὶ πᾶσαν παιδείαν μόνη τηρεῖ καὶ τοῖς ἐπιγινομένοις ἀεὶ παραδίδωσιν εἰς ἅπαντα τὸν αἰῶνα.

F. H. FOBES.

Lexington, Mass., November 21.

THE HEALTH OF STUDENTS.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of December 3 you comment editorially on the recent report of President N. M. Butler, of Columbia University, on the health of college students. That much of the intellectual work of the world has been done by invalids or half-invalids, is still imperfectly understood. Whoever doubts this should read Mrs. S. P. Shaler's "The Masters of Fate," in which she describes the physical and nervous handicaps against which hundreds of men and women fought their way to distinction.

Now, the lesson of such a record is this: a large number of the sufferers might have been spared such a handicap if they had been properly cared for in youth.

It has become obligatory, therefore, that colleges and universities, whose special business it is to train the intellectual youth of both sexes for life, shall see to it that the health of their wards is not neglected. In this work, the scope of preventive medicine is incomputable.

That President Butler, at Columbia, has drawn attention to this need, and that Harvard has this year appointed a professor of hygiene, are two hopeful signs.

WILLIAM ROSCOE THAYER.

Cambridge, Mass., December 20.

Literature

AN ENCYCLOPÆDIA IN PARVO.

The Everyman Encyclopædia. Edited by Andrew Boyle. New York: E. P. Dutton & Co. Vols. I-XII. $6 net.

The editor of this encyclopædia puts forward no extravagant claim. Knight's Encyclopædia, a useful work in its generation, nearly seventy years ago, has served, if not as a basis, at least as a guide for the present one, but even where the general treatment has been followed the editor justly says that it would be difficult to recognize, in the process of altering and amending, any obligation to the original source. A comparison of a number of articles with the corresponding ones in the parent work discloses no resemblance, even in cases where a partial transfer might have seemed permissible. Everyman's Encyclopædia is thus substantially a new work, written and compiled—as we must assume in the absence of names of contributors—by Mr. Andrew Boyle and a staff of assistants. The appearance of the new Britannica and the New International Encyclopædia must have made such a task comparatively easy to skilful hands, and these, it may be said, have evidently been employed, as far as the important articles are concerned.

The main problem was how to build up, within the compass of twelve small-sized volumes of about 640 pages each, a serviceable Anglo-American encyclopædia; that is to say, how to establish the proper relation between British and American topics. So excellent a work as Chambers's did not succeed in the effort to graft American subjects upon the British stem, and, of course, no encyclopædia in any other language will satisfy the American reader. Meyer's "Kleines Konversation-Lexikon," admirable neutral ground as it is for scientific, technological, and various other subjects, is too German to serve adequately either the British or the American reader able to consult its columns.

Externally, Everyman's is not unattractive, though there are no colored plates or other illustrations of the kind that delights the eye in Meyer or Brockhaus. Maps were excluded by the plan of the work, and we have only simple diagrams, old-fashioned woodcuts, and rather ill-reproduced photo-engravings to break the monotony of the closely printed page. No fault can be found with the abbreviations employed. The work has, on the whole, been brought well down to date, events of the year 1914 figuring not infrequently. A regrettable feature of the plan of condensation is the omission, in the biographical articles, of the month and day of birth and death. Meyer, with only half the space at its disposal, gives us precise dates. Surely, an occasional exception might have been made in such cases as that of Alexander II, where we are curtly told: "He was assassinated in March."

As if to offset the saving in space in other directions, Everyman's gives us the full string of Christian names wherever the subject had more than the one name by which he is generally known, thereby succeeding, not in establishing greater accuracy, but in obscuring the real name in not a few cases; for, unlike other encyclopædias that follow the same practice, no order is preserved in Everyman's. Thus, under Bismarck we have "Otto" first, followed by "Edward Leopold"; under Wagner, we have "Richard" last, preceded by "Wilhelm"; under Agassiz, we have "Louis" in the middle, flanked by "Jean" and "Rodolphe"; while under Reuter we have "Heinrich Ludwig Christian, known as Fritz," which last name is the only one by which Reuter is ever spoken of.

If the number of good articles on important subjects were the only criterion of encyclopædic excellence, high praise would have to be awarded to Everyman's. Such summaries as are given under "Economics" (nearly ten pages), "Great Britain" and "England" (together twenty pages), "Greece" (twelve pages), "Egypt" (sixteen pages), and under headings relating to the natural sciences and to technological subjects, may challenge comparison with similar articles in the standard encyclopædias. But the test of editorial capacity, in works of this kind, lies largely in the ability to observe a proper proportion between all the subjects; to harmonize, in accordance with one fixed standard, the important and the relatively unimportant; above all, must the editor aim at accuracy in little as well as in big things. In other words, no encyclopædia can dispense with the services of the ever-watchful, omniscient revising editor. Because Everyman's has evidently not had the benefit of such a supplementing and eliminating hand, it becomes the task of the reviewer to point out some of its defects.

First and last, Everyman's is an encyclopædia for British readers, and only secondarily is it useful to Americans. It contains a very large number of articles on exclusively British topics, the American aspect of which has either been totally ignored or only very slightly touched upon. Such articles, to mention only a few, are "Alien," "Rank" (in the army), "Salmon," "Ships and Shipbuilding" (thirteen pages), "Clergy, Discipline Act, 1892"; "Municipalities" and "Municipal Trade" (together eight pages), "Illegitimacy," "Pensions," "Merchant Shipping," "Elections," "National Insurance," "Subway," "Cycles and Cycling," "Coach and Coaching," and "Coast Protection." The opportunity to treat peculiarly important American subjects has not been seized. There is, for instance, no article on Interstate Commerce. We are sometimes referred for the treatment of the American phase of a subject to articles under another head, and, at least in one conspicuous instance, in vain. At the conclusion of the eleven-page article devoted to "Army," there is this reference concerning the American army and navy: "See United States—Army and Navy." Such a heading does not exist in the article "United States,"

and the entire subject is thus ignored. In itself, the article "United States" is fairly accurate and comprehensive, the portion devoted to American literature being better than the political part. Saner judgment prevails in the literary summary than, for instance, in the biography of Poe, with its rhapsodic overestimate of his genius.

We have discovered, in articles dealing with American history, few such grotesque blunders as those contained in the biography of Conkling, where we read: "Garfield had defeated General Arthur in the Presidential elections," . . . and "During the whole dispute C. had been favored with the whole-hearted support of the ex-President, Arthur." Better things might have been expected of an encyclopædia appealing to Americans than a one-page article on New York city (London has twelve pages), which is too condensed to contain a mention of Bronx Park, but finds room for such unilluminating commonplaces as: "New York city leads in literature in the United States, owing to the many large publishing houses which have been established. The monthly magazines are exceptionally good. New York is noted also for its daily papers," etc. A characteristic British touch occurs in the brief article on George Washington (a column in length), where it is said of him that, "though he fought against the English, [he] was a typical English gentleman."

Speaking generally, American biographies partake of the perfunctory character of nearly all the notices on modern subjects of whatever nationality. Men who have sprung into prominence in recent times, such as Bethmann-Hollweg, Arrhenius, Woodrow Wilson, are dispatched in a few words, but even celebrities of well-established reputation, such as Helmholtz and Humboldt, are treated altogether inadequately. Under Huxley, precisely as in the articles in Meyer and Brockhaus (strange to say), there is no mention of either Darwin or evolution, and the notice in Everyman's has a crowning blunder of its own, in crediting Huxley with the authorship of "The Origin of Species." There is no historical grasp in the articles on Alexander von Battenberg, Bismarck, and Francis Joseph. Some of the statements therein are meaningless.

As bearing on the question of proportion, we may mention that Gustave Hervé, the present-day leader of French Socialists, has twice as much space as Rousseau; that Hegel (in obedience to the general encyclopædic reverence for the dead past) gets three times as much space as Helmholtz, that Coleridge has exactly as much space as Goethe and Shakespeare (two and a half pages), and twice as much as Cervantes; that less than a page suffices for Isaac Newton, but that Ruskin requires more than a page, and Cecil Rhodes more than a page and a half. Rembrandt is dispatched in less than a column, but John Constable has nearly a page, almost as much as Raphael. Adam Smith has to be content with less than half a column, but more than twice as much space is given to Thomas Cook & Sons. Much space is taken up by articles on newspapers and periodicals that might well have been spared. The *Illustrated London News* has two-thirds of a column; the unrelieved eulogy of the *Saturday Review* takes up nearly as much space; under "Allgemeine Zeitung" (Augsburg, now Munich), we have a list of all the editors since 1798. The New York *Journal*, "founded in 1733 as a weekly," graces the list of dailies. To Saint Paul's Cathedral is devoted nearly a column, and St. Paul's School, London, is deemed worthy of a special article, but we have looked in vain for an article on St. Peter's, or any other of the world-famous churches.

It is easy to pick flaws due to defective proofreading in the best of encyclopædias, but Everyman's excels in a peculiar class of misspelled names. Gen. D'Aurelle de Paladines (in the article "Franco-German War") figures as "*D'Anselle* de Paladines"; Anzengruber's "Pfarrer von Kirchfeld" becomes "Pfarrer von *Hirschfeld*"; the Baldwin Locomotive Works (under the heading "Philadelphia") are transformed into "*Galvin* Locomotive Works," and the Goncourt brothers (article "France") appear as "Jules and *Emile* Goncourt." Far worse is the repeated mention of the *election* of prominent Austrians to the Upper House of the Reichsrath (as in the articles on Arneth and Count Anton Auersperg, misspelled Auersberg), and the statement that Auerbach studied in the "*University* of Hohenasberg" (*recte* Hohenasperg). One of the worst blunders in the work occurs in the article on Vienna, which describes conditions that ceased to exist fifty years ago. The Ringstrasse has not yet come to life, and walls and fosses still surround the city.

There are no articles on Böhm-Bawerk, on Diesel or the Diesel engine, or on Count Berchtold, or Benedetto Croce, to mention only a few glaring omissions. Maria Montessori has no biography, though her system is referred to under "Idiocy." Under the article "Astronomy" (twelve pages) there is no mention of Simon Newcomb (except in the bibliography), though room has been found for H. G. Wells's sentimental rhapsody of a Samurai.

There is not invariable consistency as to the language in which titles of books, other than English, are given. Some titles appear in English translation, some as originally written. Friedrich Rückert has, unaccountably, three French books to his credit. Inconsistency is also manifest in the alternation of "Baron" and "Freiherr," "Count" and "Graf"; thus we find "Mansfeld, Ernst Graf von" and "Mansfeld, Peter Ernest I, Count."

The transliteration of certain foreign names leaves much to be desired. Ignorance of the transliteration of Russian names leads to the gratuitous enumeration, after various Russian proper names, of current erroneous varieties of spelling which only mislead English readers. Thus, under "Mendeléeff" we read "Dmitri Ivanovich, or Ivanowitch," and under "Turgeniev" we have, in a parenthesis, the perplexing choice of "Turguenev, Turgency, or Turgenieff."

With all its shortcomings, Everyman's Encyclopædia is distinctly a useful work of reference, though not useful alike to all classes of readers.

CURRENT FICTION.

Stories without Tears. By Barry Pain. New York: Frederick A. Stokes Company.

Mr. Pain has sanity. He has, in fact, more than sanity; he has intelligence, he has cultivation, and he has not a little humor. He is at his best in his stories of school life—particularly "The Boy and the Pessimist," "Chrisimissima," and "The Celestial's Editorship." The simplicity of outlook, the slightness of hold, which make the other stories seem, on the whole, rather a waste of time, are a source of merit in these tales. The schoolboy of our American fiction is treated with undue seriousness; something of Mr. Pain's casual manner might do him good. For the rest (except in the fables at the end, which are witty and, in a measure, charming), Mr. Pain is rather an ingenious inventor of situations than a story-writer. His stories are refined minute farces, somewhat amusing for the moment, but altogether mechanical—and as unproductive of real laughter as they are of tears.

A Child Went Forth. By Yoi Pawlowska. Boston: Houghton Mifflin Co.

There was a child went forth every day,
And the first object he looked upon, that object he became,
And that object became part of him for the day or a certain part of the day,
Or for many years or stretching cycles of years.

These lines of Whitman's serve as motto for a book of unusual quality. The American publishers give no information about the author or her work; but from the evidence of these pages we surmise that she is a Hungarian who as a very young girl was sent to school in England, and that this is the story of her childhood in Hungary. Its charm is not easy to define—chiefly the effect, it may be, of its apparent artlessness. Its exotic flavor seems to contribute little to that charm—far less than the sense of natural kinship with these people of the strange names and odd customs. The child-life recorded seems, in a way, quite unremarkable, and yet the chronicler, by virtue of her sincerity, contrives to make it altogether worthy of remark. Here is the old adventure of dreaming childhood in a waking world, the slow and painful adjustment of the newcomer to the rules of thumb by which the adult race lives. It is one of the most moving of themes, but its treatment in English commonly ends in rank sentimentalism. The present little narrative is realistic in the best sense—faithful to the fact, but to the carefully chosen fact; and animated by a perfectly healthy and unforced sentiment. In short, with all its appearance of slightness and artlessness, it is, in its way, a very genuine product of (alas, how else shall we

phrase it?) literary art. A reviewer in *Punch* laments that our knowledge of little Anna ends with her departure for England, that "we are not told which particular English school was favored with her patronage, nor how she got on there." It is a singularly dull remark, since one of the chief merits of the little work is that it is so obviously complete in its own character—as a study of childhood. We have an Elsie Series already!

Tales of Two Countries. By Maxim Gorky. New York: B. W. Huebsch.

A sense for structural values and for form has never been the strong feature of Gorky's novels; and the want of it has uniformly damaged his very short stories and sketches—stories shorter, that is, than "Twenty-six Men and a Girl" and the powerful "Chelkash." The characters may be vividly done, and there may be a poetic feeling for nature; but dramatic outline is wanting, and the pulse of action but fairly begins to beat before it is halted again. His longer narratives may be long-winded and monotonous, but realism can be exhibited at the length necessary to demonstrate spiritual insight, until character study and the stripping of vicious social environment sometimes reach astonishing force. Horrifying naturalism, human analysis without incident, can seldom be compressed effectively into ten pages. The present volume falls into two divisions. In the first there are a dozen thumb-nail vignettes of Italian scenes, unambitious and frankly objective; most of them giving an impression of triviality, but some possessing reserve force. In the second are as many stories of Russian life, savage, satirical, and sardonic by turns. The writer here knows not merely the outward being of his people, but their inner; it is only unfortunate that his tone of pessimism leads less frequently to direct sincerity than to a cynical toying with semi-allegorical ideas, as in "The Poet," "The Writer," "The Liberal." The tone is the intellectual smartness of a man made mordant by observation of life rather than deeply moved by it. There can be few to whom the volume will not seem a falling off from "A Confession" or "The Spy."

Little Eve Edgarton. By Eleanor Hallowell Abbott. New York: The Century Co.

The nice young chap at the summer resort announces a desperate conclusion—there isn't an interesting girl to be found nowadays outside of a magazine story. His elderly confidant retorts that if he thinks so, it is because he hasn't known where to look for her; smart dressing and a pretty face are not the signs by which you know an interesting woman. Thereupon, with all the impersonal benevolence of a pure theorist, he requisitions the services of a noticeably insignificant-looking daughter to prove his point. Follows the rehearsal of the humorous miseries of this enforced companionship, and the unfolding of the remarkable personality disguised in the little Edgarton girl's colorless manner and shabby clothes. The singular thing about the poor dear, as we understand it, is that her unusualness isn't a matter of choice, but of having lived all her life at the mercy of a globe-trotting scientist of a father. Bored to extinction by an existence in which adventure has been daily fare, she ardently pines for the settled and the commonplace. Death and disaster by land or sea fail to stir her blood (if possible, she will save your life expertly, but quite perfunctorily); what really rouses her is a rare culinary opportunity like that of making four hundred muffins for the hotel breakfast. She will obligingly discuss peat-bog fossils with you, but what she heartily prefers is to steal a while away from microscopes, specimens, and notes on all the 'ologies, and spend a quiet half-hour bringing her own paper-doll book up to date. We are glad to be able to announce that, in spite of her heavy sartorial handicap, she finally wins her way into the sphere of fashionable conventionality from which she has heretofore lived in sorrowful exile; also that the nice young chap recognizes with joy his interesting girl at last, although he has to be struck by lightning, and she to sustain an alarmingly severe crack on the cranium, before the author is able to lead them to so satisfactory a conclusion.

Gerald Northrop. By Claude C. Washburn. New York: Duffield & Co.

This is an excellent example of a type of current fiction which possesses a number of good qualities, and which we might very well do without. It is the type of clever "workmanship," well modelled and well chiselled, or at least well chased. But it is consciously clever; in its most vivid or intense moments it never forgets to be sophisticated. Provincialism is its blackest beast of fear. If New York or London or Chicago serve for its earlier scenes, we may be sure it will prove to be only a way-station to Rome or Paris. And the hero upon whose career we are called to hang in a well-bred way is pretty sure to be that spineless puppet, or puppy, with a Temperament, who, thanks largely to books of this sort, threatens to stand for the creative artist in the popular fancy. The Gerald of this story is that puppy. It is not his fault, because his father has been it before him; he is of pedigreed stock. The grandfather has barely emerged from shirtsleeves to the ownership of a big factory in a provincial Western city; an honest, hard-working American, piteously aghast at the spectacle of his strange offspring. The ineffectual father and his Parisian wife have died during Gerald's boyhood, and the grandfather dies while he is at Harvard, leaving him everything, with the simple request that he "give America a chance" before, as it were, following his Gallic nose across the water. Gerald duly goes through the motions, but is too fastidious for this crude land; and though in the end, after a series of æsthetic and amatory adventures abroad, he does return to it, he returns unchanged, still the puppy conceitedly and indecently whining for the moon. The trouble with him, from a robust reader's point of view, is the trouble with all heroes of his kind. He is responsible to nothing but to his own self-titillated sensibilities; there is no strength in him. Therefore, stories like this—it is odd how many of them there are—represent, with all their cleverness, a sad waste of energy. A hero is not a formula or a code of morals. Virtue in the little sense is neither here nor there with him; but virtue in the big sense we must have from any human being who demands so much of us in the way of time and attention. Tom Jones has it, and Silas Lapham, and even Pendennis; but not a mother's son among the fecund tribe of Geralds.

AN OVER-RATED STATESMAN.

The Memoirs of Francesco Crispi. Compiled from Crispi's diary and other documents by Thomas Palamenghi-Crispi. Translated by Mary Prichard-Agnetti. Vol. III, "International Problems." New York: G. H. Doran Co. $3.50 net.

The third volume of Crispi's so-called Memoirs covers chiefly the last decade of the nineteenth century. Crispi was hurled from office on March 3, 1896, as a result of the national indignation at the disaster in Abyssinia. He spent the remaining five years of his life sorting his papers, editing, expurgating, and destroying, so that they might eventually serve as his apologia to posterity. His nephew, who has edited them, goes farther and composes from them a panegyric pitched in a major key.

The present reviewer, as he has indicated in his comments on the earlier volumes, does not believe that it will ever be possible to whitewash Crispi. As time goes on, and the Crispian *claque* grows faint, the majority even of Radical Italians will perceive not only that Crispi left nothing of permanent value to Italy, but that, partly through his vanity and partly through his antipathies, he bequeathed to her a legacy of troubles. And throughout the twenty years, from 1876 to 1896, when he was the dominant figure in Italian politics, whether in office or not, corruption in its crudest and basest forms flourished unchecked.

The central fact in Crispi's foreign policy was that he substituted subservience to Germany for subservience to France. In the seventies that may have seemed prudent, but during the last quarter of a century the Triple Alliance has been of doubtful value to Italy, until latterly it has proved actually harmful. Crispi was cunning, but his was the cunning of the Albanians, who devote their energy to vendettas, and he became the easy dupe of Bismarck's more sophisticated craft. He came away from his first visit to the Chancellor convinced that Germany would lavish her favors on Italy; and yet, almost immediately after,

Bismarck and Salisbury connived at the French occupation of Tunis—that act which enraged the Italians against the French, and has rankled to this day. It was Bismarck's purpose by entangling the French as much as possible in North Africa to lessen the strength of the French army on the German frontier, and also to infuriate the Italians against the French. He did both. Hence the Triple Alliance.

The present volume deals chiefly with post-Bismarckian diplomacy, but it shows Crispi still acting on Bismarckian lines. The topics taken up are Tripoli and France, the fortifications of Biserta, the troubles raised by the Irredentists with Austria, the friction between Italy and France from 1888 on, the Balkan question, and the crisis in European alliances during the last years of the century.

Although Crispi's acts in these various affairs are so dressed up as to make him appear the master in each case, when we ask for the results, we find mostly talk on his part and a victory for his opponents. The French built Biserta; Crispi yielded to the Austrian demands and muzzled the Irredentists as far as he was able; Crispi's financial war against France caused hard times in Italy, which the German alliance did not alleviate; and his letters, speeches, and suggestions in regard to the Balkans had no appreciable effect in the subsequent development of that peninsula.

Read between the lines, the flattering messages he received from the German and Austrian Emperors and Chancellors simply mean that they knew he could not and would not break away from them, and they therefore never called his bluff. In one case—in a petty quarrel with Portugal—he seems to have succeeded.

We regret that his editor has been so intent on making Crispi out a master of international statecraft that he has omitted, or reduced to infinitesimal proportions, the cardinal facts in Crispi's Administrations at home. We looked for something authentic on the "Moral Question" episode, on the bank scandals, on Crispi's cowardice in continuing the war in Abyssinia which he professed to disapprove of, and on many other political and personal matters. The nephew even fails to do justice to Crispi's ruthless suppression of the agrarian insurrection in Sicily and on the mainland, although that suppression was the best proof that Crispi ever gave that he could act as well as threaten. It would be indiscreet to remind the modern Italian extremists that he persecuted them twenty years ago.

This volume contains many interesting letters, or reports of conversations, which the expert will know how to use profitably. But all the material lies under the suspicion of having been manipulated for a definite purpose, and no cautious historian would trust solely to it as his source of information. Whoever advertised Crispi as "the prince of all diplomats" must have either a febrile imagination or unfathomed ignorance.

ROOSEVELT'S ADVENTURES IN SOUTH AMERICA.

Through the Brazilian Wilderness. By Theodore Roosevelt. Illustrated with photographs. New York: Charles Scribner's Sons. $3.50 net.

When Col. Roosevelt started on this expedition, which was to bisect South America from Buenos Ayres to the Amazon, it was with the intention of gathering mammals and birds for the American Museum. By the generous interest of the Brazilian Government, the reconnaissance was enlarged and became geographical and zoölogical in character. In any event we may be certain that the versatile mind of the author would not have confined his observations to the higher vertebrates. In general treatment this volume differs but slightly from Col. Roosevelt's "African Game Trails," the narrative being chronologically arranged, a consecutive account of each day's happenings presented clearly, informally, and in great detail, with diversions—literary, historical, or zoölogical—whenever prompted by the stimulus of some pertinent event. The diction is the best that the author has ever put into a book of travel, and the slight philosophical touches are more virile, more thoughtful, than those in the African narrative. With less of sensational incident to surfeit the emotions, the events of the expedition have received calmer, more dispassionate treatment and consideration, and thus add very appreciably to the pleasure of the reader. Instead of the big-game hunter, we have here the chronicles of a naturalist in the best sense of the word.

The first two months of the trip are passed over almost without comment. This period was devoted to a lecture tour through Brazil, the Argentine, and Chili, and was devoid of scientific note. Asuncion marked the beginning of the wilderness life, the ascent of the Paraguay the first stage in the continental voyage. From river to river the party travelled, always to the northward, passing at last over the highland wilderness, the low divide from which the waters flow southward into the Paraña or north towards the Amazon. This was the home of the Nhambiquaras—an isolated tribe, friendly but not servile, wearing neither clothing nor ornaments, hunting by day, lying down in the sand to sleep at night.

Then came three weeks of dangerous voyaging down the Rio Duvida, Rio Roosevelt, or, as it has finally been called, Téodoro, before the Madeira was reached, and at last the Amazon. Six weeks of perilous labor were spent in navigating an almost endless succession of rapids; five out of seven canoes were lost within the space of a month and a half, during which the party saw not a single human being; one man was drowned, another was punished for insubordination, and retaliated by murder; most of the party suffered from fever, and about half the baggage was lost. So much for the distressing side. Besides the host of interesting notes recorded by the author on the wild creatures of the jungle, there is a list of over twenty-five hundred birds and five hundred mammals, which were collected, chiefly by Cherrie and Miller. With the expert geographic assistance of Col. Rondon, the River Téodoro was mapped for the first time throughout its length of fifteen hundred kilometres. A competent professional photographer would have added much to the value of the trip, although the pictures are as good as the usual snapshots taken on such expeditions. The maps, appendices, and index are a delight in their thoroughness and lucidity. A single paragraph of life on a small boat in the River of the Tapirs must suffice as a glimpse of the interesting personnel:

The trip was pleasant and interesting, although there was not much to do on the boat. It was too crowded to move around, save with a definite purpose. We enjoyed the scenery; we talked—in English, Portuguese, bad French, and broken German. Some of us wrote. Fiala made sketches of improved tents, hammocks, and other field equipment, suggested by what he had already seen. Some of us read books. Col. Rondon, neat, trim, alert, and soldierly, studied a standard work on applied geographical astronomy. Father Zahm read a novel by Fogazzaro. Kermit read Camoens and a couple of Brazilian novels, "O Guarani" and "Innocencia." My own reading varied from "Quentin Durward" and Gibbon to the "Chanson de Roland." Miller took out his little pet owl Moses, from the basket in which Moses dwelt, and gave him food and water. Moses crooned and chuckled gratefully when he was stroked and tickled.

THE TEST OF STRATEGICAL THEORY.

France and the Next War: A French View of Modern War. By Commandant J. Colin, of the French War School. Translated by Major L. H. R. Pope-Hennessy, D.S.O. New York: George H. Doran Co.

This book is simply a reprint of the greater part of "The Transformations of War," by Major Colin, of the French army, translated by Major Pope-Hennessy, of the British Service, and published by Hugh Rees, Ltd., London, 1912. Its title is not that given by the author to his book; and save the legend "reprint in 1914" on the reverse of the title-page, there is nothing to indicate that this is not a new work, and absolutely nothing to show that the "Transformations" of 1912 and this work are (omissions apart) one and the same thing. Inasmuch as both books are from the same English publishers (for the American imprint is merely formal) we must believe that there must be some motive, if not reason, in thus giving out a reprint without the slightest reference to its original appearance, and this motive, in our opinion, is suggested by the title that heads this notice. For who would not believe, on picking up the book, that it is the French pendant of von Bernhardi's "Germany and the Next War," the French counterblast of the very peculiar views advanced so vigorously by the German protagonist? But the two are as wide apart as the poles, for whereas von Bernhardi is attempting to justify a

certain course on the part of the German Empire, Major Colin, a member of the staff of the Ecole Supérieure de Guerre at Paris, merely undertakes to set out the great principles of modern warfare. His book would be just as useful to the Germans as to the French; von Bernhardi's could find an application only at home. In view of these remarks, suggested by the *ad captandum* title of the publishers, what must we think of the assertion of the preface that "throughout [Colin's book] there is an absence of the bombastic jingoism of the Bernhardi school"? It is not a question of jingoism: the two books are simply not comparable, and no choice of title can make them so.

Ever since 1875 the French have believed, and since the Agadir incident have been convinced, that Germany would attack them, sooner rather than later. French military literature has been deeply colored by this national conviction. Moreover, it is no breach of confidence, to-day, to say that the courses of the great French Staff School have had for their chief end the development of ways and means to achieve victory in the coming war. But of this spirit not a trace is perceptible in Major Colin's book. It is a calmly scientific work, historical in its treatment, and especially interesting from its analysis of Napoleon's conception of what successful war exacted of a general.

Upon this and other matters we need not dwell, inasmuch as the book is already well known to students of the military art. But we cannot forbear to glance for a moment at the chapter, War in the Twentieth Century, in order to compare some predictions therein made with actual occurrences in Europe. Thus (p. 279), "the immense armies mobilized nowadays will hardly be contained in the theatre of operations. In a Franco-German war, for example, if the troops were deployed between Longwy and Huninguen, their depth would be six men to the yard; it would be three to the yard between Dunkirk and Montbéliard. . . ." This last (we refer to the length and position of the line) is practically what we have in the western theatre; indeed, earlier in the book (p. 139), the author says, "We may anticipate a battle which will bring to grips 3,000,000 of men on a front of 150 to 250 miles."

The following principle (p. 280) apparently has been found dangerous of application: "The general will hold large numbers of troops at his disposal in certain zones where he means to obtain success at any price by developing and repeating his attacks. He will denude other regions where no decision is being sought for, and he will see no great objection to giving way here and there to the enemy." Apparently (p. 140) this local yielding might be desirable: "A local success at a point in the front creates deadly difficulties for the victor . . . of two equal armies, that one which succeeded in piercing its adversary's centre would perhaps by its very success place itself in a most dangerous situation." Here is a prediction fully verified: "The armies of the future, it seems, will be more like massive and heavy rollers crushing all that they pass over" (p. 279). Still another: [railways] "lend themselves to rapid movements, and allow of the transport of an army from one end of the theatre of operations to the other in a few days" (p. 282). And so, "they [the Germans] might, after having to all appearances piled up their troops and their efforts at one extremity of the theatre of operations, after having repeated their attacks and thus determined the concentration of our forces on one of their wings—they might, I say, suddenly bring their principal strength to bear on the opposite side." Fortunately for France, this prediction has not come true; the aeroplane is now a factor. In fact, air-scouting has put an end to guesswork in actual operations, and will require the re-writing of most of the textbooks and treatises.

Notes

"The Evidence in the Case," by the Hon. James M. Beck, has been published by G. P. Putnam's Sons.

Doubleday, Page & Company announce for publication in the spring: "The American Indian," by Charles A. Eastman; "A History of American Literature," by Leon Kellner; "The Cost of Living," by Fabian Franklin; "Socialism in America," by John Macy; "The Drama in America," by Clayton Hamilton; "The American College," by Isaac Sharpless; "The American School," by Walter S. Hinchman; "The University Movement," by Ira Remsen; "The American Navy," by Rear-Admiral French E. Chadwick.

Books on modern Germany that are confirmed, rather than confuted, by present events must have certain permanent qualities. Of such are three, among many that have accumulated on our shelves. William Harbutt Dawson's "The Evolution of Modern Germany" (New York: Scribner; $3.75) is a solid contribution to our knowledge of the Empire. Temperate, clear-sighted, and well written, it discusses industrial and economic conditions in a convincing way. The book was published some years ago, and is in some respects antiquated, but it was nevertheless well worth republishing at the present day. Nothing, certainly, can be more timely than to have the value of German colonies, and the efficiency of Dr. Dernburg's administration of them, so sanely adjudged as they are at the hands of Professor Dawson. Facts and figures speak loudly in this authoritative volume, and throughout there are illuminating touches, as when we are reminded that "Mr. Richard Cobden, calico-printer," foretold on December 13, 1838, "the day when the weapons which English enterprise and example were then placing in German hands would be turned against ourselves with fatal effects." The mere enumeration of the names in "Men Around the Kaiser: The Makers of Modern Germany," by Frederic William Wile (Bobbs-Merrill; $1.25 net) is imposing, and the favorable impression is heightened by the author's bright and, on the whole, skilful characterization of such pillars of strength (sometimes imaginary rather than real) in the making of the mighty empire as Admiral von Tirpitz, Alfred Ballin, Dr. von Bethmann-Hollweg Count Zeppelin, Prince von Bülow, Count von Bernstorff, Prince Lichnowsky, and two dozen more—not all statesmen, warriors, and captains of industry, but also scientists, like Ehrlich, and poets, like Gerhart Hauptmann. There are among them, likewise, the "composer and revolutionary," Richard Strauss; the "stage reformer," Max Reinhardt, and the "journalist and matador," Maximilian Harden. If this seems an incongruous assortment, the author's answer would probably be that it takes all sorts of men to make a modern empire, or, at least, as he freely admits in an introduction written after the outbreak of the war, to constitute a nation of men "who are all for war." The volume, if distinctly journalistic and somewhat highly colored, is readable and interesting.

"Memoirs of the Kaiser's Court," by Anne Topham (Dodd, Mead; $3), an attractive volume outwardly, quite unconsciously possesses considerable biographical value. What the sensible, self-possessed English governess has to say of her charge during many years, the Princess Victoria Louise of Prussia, is of no particular interest, and was perhaps hardly worth preserving, but the glimpses we get of her royal father are refreshingly direct and truthful. If we see, now and then, "the robust personality of the Emperor, so frank, so generous, so open-hearted," we also see him in his impetuous, overbearing moods, and we have this pen-picture of him which, we suspect, the future historian will not disdain to make a note of: "Nobody has ever accused the Emperor of being a diplomatist. He himself believes that he is very astute and can see farther than most men. He is, so to speak, a little blinded by his own brilliancy, by the versatility of his own powers, which are apt to lead him astray. He has never acquired the broad, tolerant outlook of a man who tries to view things from another's standpoint. He has, in fact, only one point of view—his own—and a certain superficiality characterizes his thought . . . he does not, in fact, give himself time and opportunity to think things out, to weigh consequences, and he has, unfortunately, few really great minds around him."

The historians-to-be of the present European war will certainly suffer from no lack of material, though if they desire their histories to be at all true they will be well advised to disregard much contemporary "evidence" concerning the main issues at any rate. Their labors, on the other hand, will be considerably lightened, in the way of atmosphere, by such valuable little works as Mr. Charles Inman Barnard's "Paris War Days" (Little, Brown; $2 net). In it the Paris correspondent of the New York *Tribune* does a really useful and unpretentious work, by setting down, in the form of a diary, his observations of life in Paris during the opening days of the war, of the behavior of the populace, the means taken for provisioning and defending the capital, the inconveniences endured by American and other foreign residents, and the like. Very little that happened between the outbreak of the war and the second week in September, when the German menace was finally swept back to the northward, escapes Mr. Barnard, from the condition of the cattle parked in the Bois de Boulogne to the sound made by projectiles dropped from German aeroplanes upon the city. The book is per-

haps overloaded by name-lists of those Americans who shared the committee work of various hospitals and other good deeds; but that is only natural, and too much recognition cannot be paid to such admirable institutions as the American hospital at Neuilly. Mr. Gordon Bennett's marriage, however, seems scarcely worthy of careful immortalization.

"Social Life in Old New England," by Mary Caroline Crawford (Boston: Little, Brown; $2 net), is of no marked novelty in theme or treatment, but a pleasant addition to the steadily growing series of gossiping commentaries upon the manners and conditions of early New England life. The author of the present book has spent many zealous years in exploring old Yankee records, and has several times given the results of her labors in acceptable form. "Old Boston Days and Ways" and "The Romance of New England Roof-Trees" were full of interesting and quaint material, and blessed with that touch of humor which is a prime essential of this kind of work. To choose out of the immense mass of available data (available for those who have the patience to seek them out) those which are really salient and characteristic, is one difficult part of the task, and to give them something like the relative space which each of them deserves, is another. The author has done these things and done them with evident zest and ease. The fault of her present subject lies in its scope. Old New England was little enough in a sense, and it had solidarity of many kinds. But its geographical diffusion, the relative isolation of its communities, present an obstacle to the chronicler who attempts to generalize. The happiest books in this kind are likely to be more closely restricted to the local field. Such a book we recall in the "Taverns and Turnpikes of Old Blandford" which appeared some years ago—a labor of love which was also a labor of discretion and charm. The present book, in attempting to touch upon all the phases of New England life, cannot carry the treatment of any one of them as far as the author is capable of carrying it. Under the conditions she makes extraordinary headway. As a kind of primer of old Yankee methods of learning, marrying, lawing, worshipping, drinking, and so on—a primer compiled as by a schoolma'm with a twinkle—this may be commended. Now and then, as in the treatment of the "bundling" custom, it is surprisingly frank, over-frank, perhaps, from the family-table point of view.

The fourth volume of Charles Harding Firth's notable illustrated edition of Macaulay's History of England (Macmillan; $3.25 net) contains Chapters XIII to XVII, inclusive, of the original. The variety of the illustrations is shown by the beautiful colored plate of The Pass of Killiecrankie, reproduced from a water-color drawing by G. F. Robson in the Sutherland Collection, and, almost cheek by jowl with it, a reproduction of The Scotch Protestants' Courage, a ballad in the Pepysian Collection. The care and erudition displayed in the selection of illustrations for the earlier volumes are evident in this one, for which the publishers have done their part in the same satisfying fashion. One can only repeat that the work deserves all praise, and be glad that if the History has waited a strangely long time for this sort of edition, it has found the right hands to produce it.

Two books, both dealing with the legal side of municipal development, are "Carrying Out the City Plan," by Flavel Shurtleff, in collaboration with Frederick Law Olmsted (Survey Associates, publishers for the Russell Sage Foundation; $2), and "Municipal Charters," by Nathan Matthews, a former Mayor of Boston (Harvard University Press; $2 net). The first of these books is called forth by "the astonishing variation in the practical efficiency of methods actually employed and prescribed by law or legal custom in different parts of the United States in acquiring land for public purposes, in distributing the cost of public improvements, and in other proceedings essential to the proper shaping of our growing cities to the needs of their inhabitants." The second book is an equally direct presentation of the essentials of an American city charter, along with drafts of the responsible-executive type and the commission type. The latter volume thus has to the former the relation of the general to the particular. Both books are intensely practical, and should be of value to all persons engaged officially or semi-officially in city charter-making or administration.

Mary Antin's "They Who Knock at Our Gates" (Houghton Mifflin; $1 net) is described in a sub-title as "A Complete Gospel of Immigration." It is an attempt to prove that any restriction upon immigration into this country is a violation of the Declaration of Independence, and that the immigrants are a blessing to us rather than otherwise. The book is a plea rather than an examination of a question, although it is full of argument. Designedly or not, it leaves the impression that, in the view of its writer, our immigrants are rather the best element of our population, having the sterling qualities of the Pilgrim Fathers that the rest of us have almost lost. Every steerage passenger is a potential genius. One is offended by a, perhaps unintentional, tone of superiority in the pages, as of one sitting in judgment. Not by such treatment can a great issue be settled.

In "The Bible and the Anglo-Saxon People" (Dutton; $2 net), William Canton has again told the wondrous story of how the people of the British Isles got their Bible and what price in blood and in money they have paid for it. Written in a style simple enough for youth to follow, and crammed with memorable anecdotes, the story comes down from Cædmon through Wycliffe, Tindale, Coverdale, and the martyrs to the work of the Bible Societies of the nineteenth century. Handsomely illustrated specimens of early typographical work and parallel versions of familiar passages show how our modern readings developed from the vigorous language of the early translators. Perhaps the newest historical matter in the volume refers to the Biblical pageants with which Queen Elizabeth was acclaimed at her coronation in London by a people who looked to her to release four prisoners, "the four Evangelists and Apostle Paul." It would be well if teachers in our Sunday schools would convey to the children some of the romantic story of the volume upon whose teachings so much of the Anglo-Saxon character has been built. Speaking of the work of the British and Foreign Bible Society, founded in 1804, the author pertinently remarks in conclusion: "It will surely be one of the curious facts in the history of Victorian literature that of all the men whose vision was filled with the ideas and actions which fashion the destinies of States, no great writer has thought it worth while to notice a movement that can hardly be matched in duration, continuity, range and results by any other in our time."

At last Dr. Hermann Türck's "The Man of Genius" appears in an English dress (Macmillan; $4 net). It is significant that the translation was made in Germany, not demonstrably in answer to any call from Macedonia. Most of it is from the sixth German edition, but the additions in the seventh German edition have been Englished by a different hand. Thus, after eighteen years of revision and enlargement, this widely read and much-reviewed work finds its way out of the Fatherland. The production gives rise to a very interesting question: Why has it enjoyed its long-continued vogue? The reason cannot be its subtle or profound treatment of the mystery of genius. For Dr. Türck genius holds no mystery. Starting out with the æsthetic of Kant, he arrives at entire agreement with Schopenhauer that "*genius* is simply the completest *objectivity, i. e.*, the objective tendency of the mind, as opposed to the subjective, which is directed to one's own self." The conclusion of the whole matter is that "the creative work of the artist, the philosopher, the statesman, or the founder or reformer of a religion, is therefore primarily dependent on his disinterested absorption in the nature, the essential, true properties of things. . . . A selfish man is at the same time a stupid man incapable of creating anything; he can only destroy." With such convictions he finds no difficulty in proving that Alexander and Napoleon ceased to be geniuses when they embraced "egotistical self-delusion." Dr. Türck's explanation appears from this point of view to be only an extension into philosophical and practical fields of Schopenhauer's definition of artistic genius. Having gained a vision of this illuminating truth, he endeavors to make it prevail more and more unto the perfect day. He unerringly singles out as one of the children of darkness Cesare Lombroso on account of his theory of insanity. The sarcasm and ridicule with which he overwhelms and rends asunder the Italian leave no room for a pretence to judicial calm or critical detachment. Yet his treatment of the criminologist is affectionate compared with the onslaught upon that "mentally disordered antisopher" distinguished by "the will to stupidity," Friedrich Nietzsche, where his sputtering is truly amusing, even though heard through a starched and ironed-out translation. For his "anarchistic or individualistic point of view," Ibsen also is attacked front and flank.

The reviewers, however, have not emphasized so much Dr. Türck's incalculable services to the stanch, loyal party in church and state as his excursions into literary criticism. The *Berliner Tageblatt* declared: "Dr. Türck has the indisputable merit of having established his own opinion on two important literary questions, namely, his conception of the character of Hamlet and his explanation of Faust's blindness caused by 'Care.'" Of "Faust" it is sufficient to observe that before Dr. Türck all critics "had failed to do justice

to the fundamental idea of the poem, because they had overlooked the essential element of genius in Faust." The reason for this universal obtuseness is manifest: other critics have not held the key—Dr. Türck's theory of genius. But his services to Shakespeare are more priceless. According to *Bühne und Welt*, his "interpretation of 'Hamlet' may rank with the most important utterances of modern æsthetic criticism." The notable feature of this interpretation, which in general resembles Werder's, is that it was suggested by Matthew xii, 46. He maintains, in brief, that "he who wishes really to understand Hamlet must constantly bear in mind that his nature is that of a man of genius," "a man of eminently energetic character," who hesitates throughout the play "because his whole mental life is engrossed and all his desires and endeavors are arrested for the time being by the recognition of the fundamental error that has so long influenced all his views of the world and man, that every decision and purposeful activity in themselves become hateful to him." It does no good to object that this is a conception evolved from speculative considerations, not from a synthetic study of the play itself; or that it takes no account of Elizabethan theatrical conditions and Shakespeare's dramatic purposes; or that it proceeds on the fundamental confusion that Hamlet was a real person existing outside the play. For it is obvious that Shakespeare must have written the play to illustrate Dr. Türck's thesis, so nicely are the two made to dovetail into each other. Whatever else the bulky volume may not accomplish, it will at least show English readers how far the steadfast religious public of Germany will follow its champion into diverse and unfamiliar fields of thought.

"The Spell of Spain" (Boston: The Page Co.; $2.50 net) is a record of the impressions produced by that country upon two sympathetic travellers, husband and wife; it is largely cast in the form of dialogue. "Doña," the principal speaker, is a mixture of Bachfisch and blue-stocking. She has read everything worth reading that has ever been written about Spain, and is equally happy at quoting from the pedantic Dozy and the colorful Masefield. When memory fails, she reads from a volume of "Quick Notes," which, to her husband's amusement, she terms her "Don Quicknotie." The latter, the better to serve as a foil for his more gifted better half, affects an air of Sancho Panza-like prosaicness, as when, for example, the Rock of Gibraltar reminds him of the Woolworth Building. But as a punster he is no whit his wife's inferior. "How long is it since the Arabs took the Rock?" he inquires. "Seven hundred and eleven," answers Doña quickly. "Seven come eleven. You might have known they came from Africa." Such witticisms as these might well deter the most intrepid traveller on Spain's very threshold. But these and many other things in the book are explained, and even excused, when the reader is let into the secret that "Doña" and the scribe are on their honeymoon. Those who love a lover, and we are assured that the whole world does, will enjoy the further conversations and adventures of this interesting pair. For our part, we cannot overcome a feeling that it would be indiscreet to tag along, an unwelcome third, when the protagonists would so infinitely prefer to be alone, revelling in gush, and laughing at each other's jokes. If we may hazard a pun of our own, the orthography of foreign words is not all that might be expected of "The Spell Series."

Shortly before the outbreak of the war, in which he is serving as a volunteer, Lucien Foulet, sometime professor in Bryn Mawr College and in the University of California, published an octavo volume of 574 pages entitled "le Roman de Renard" (Paris: Champion; 13 fr.). We may say of this work, as was said in its day of Sudre's "les Sources du Roman de Renard" (1892), that it opens a new period in the study of the subject. Thoroughly familiar with what has already been written, Foulet produces much new material, and draws new and significant conclusions. His book is a favorable example of the best type of French scholarship—clear and accurate in statement, vivid and attractive in style. While some portions form veritable monographs, yet they contribute to the establishment of these main propositions: the separate "branches" of the "Roman de Renard" were not a rewriting of older French originals now lost, but were composed by their several authors in the last quarter of the twelfth century and the first years of the thirteenth; they were derived in the main from definite literary sources, of which the most important is the Latin poem "Ysengrimus," of 1152; and in their turn the earliest "branches" were the direct source of the German "Reinhart Fuchs." Foulet is inclined to belittle the importance of folklore, as when he derives certain folktales now current in our Southern States, in Finland, and among the Hottentots, from the twelfth century French poem, and refuses to accept any inferences in regard to stories current in oral tradition in the Middle Ages; but this does not affect his chief argument, and a reaction was needed from the excessive assertions that have been made as to the "popular" origin of the beast-epic. Any one familiar with the work of Grimm, Sudre, Gaston Paris, and Voretzsch sees at once how revolutionary Foulet's views are. He pays little attention to the original sources of the stories, being content to show the essentially literary origin of the French poem, which in turn became the source of subsequent beast-epics. His chief conclusions are not likely to be overthrown, and his work has cleared up some of the most perplexing problems of mediæval literature.

Various controversies have of late years directed public attention to the highly efficient railway brotherhoods which represent the finest type of trade-union organization. Responsive to this interest is the volume entitled "Railway Conductors: A Study in Organized Labor," by Edwin Clyde Robbins (Columbia University Studies; Longmans; $1.50), which traces the formation of this powerful union, its methods of government, the trade regulations concerning wages, hours, and working conditions, and the steps that have been taken to enforce its demands—negotiation, mediation, arbitration, strikes. A section of the book is devoted to the beneficiary features. This powerful organization, with 49,000 members, ninety per cent. of all train conductors, deprecates the use of the sympathetic strike; advocates, at least formally, the open shop, although it is not particularly gracious to "outsiders," and insists upon regulating the wages of non-union men. Its jurisdiction extends throughout the country, and it has no successful rival organization. It has the distinction of having contributed a member to the Interstate Commerce Commission in the person of its president, Edgar E. Clark. As a trustworthy history of the order and a clear and accurate statement of its present activities and ambitions, this volume is to be commended. But there are many indications that the author has been influenced by the winning personality of President Garretson, who, according to the preface, "has shown a kindly interest in the work at every stage." He looks at the problem largely from the point of view of the conductor. Hence he fails to bring out clearly some of the less favorable aspects of these great brotherhoods: their militancy and their disregard of the interests of other classes of railway labor. The book does not, and probably was not intended to, give a balanced discussion of the issues involved between the railways and their men.

NOTES FROM ABROAD.

A single news item shows the unity of all classes and creeds of Frenchmen in their present struggle for national existence and the universal uprising of all in their country's defence. The Monod family is well known among American Evangelicals by its writings for several generations, and is now represented by the ultra-Modernist Wilfrid Monod. Gabriel Monod, who so long was at the head of historical study in France, died only a few months ago. Of the living Monods, eighty-one are now actually serving in the French armies. Scarcely less known is the Berger family, with its professors in the Paris theological and medical faculties, another a distinguished palæograph, and yet another the successor of Renan. There are fifty-seven of these Bergers serving under the French flag. Pastor Westphal, of Lausanne, Switzerland, has his two sons and seventy-four members of his family in the French army. The Bridels, of the Swiss Protestant publishing and theological family, are represented in like manner, as are all these families which have been French Huguenots time out of mind.

An article on the history of the Hohenzollerns by Charles Giraud, which was published in 1872 by the *Revue des Deux Mondes*, relates a forgotten incident that is not without present piquancy. It is connected with the accession of that family to the royal title in Prussia. In 1618 the head of the house, who for two hundred years had enjoyed Electoral rank as Margrave of Brandenburg, was created Duke "in" Prussia. This meant East Prussia, which the Teutonic Order had lost to the King of Poland. In 1656 the title became Sovereign Duke "of" Prussia. This was the title held by the Elector Frederick when he entered into the alliance against King Louis Fourteenth of France; and, to reward him, Emperor Leopold proposed changing it to the increased dignity of King. This was in the year 1700; and the representative of the Teutonic Order and the King of Poland, each claiming suzerainty over any such royalty, protested against the use of the title King "of" Prussia. So the Hohenzollerns had to begin, in 1701, as Kings "in" Prussia. What is not so well known is that "the question

had been seriously discussed of calling the new sovereign King of the Vandals"; and that, later on, this title did not seem displeasing to Frederick the Great. But against this, too, there were protests, notably on the part of the Duke of Mecklemburg. His protest may have been based on his hereditary right, since 1436, to the title of Prince of the Wends whereas the Hohenzollerns were sovereigns of the Wends only since 1464, when they became Dukes "in" Pomerania.

Among the numberless hospitals which the fatalities of war have obliged France to open in every part of her territory, there is none more curious materially than that installed in the Grand Palais at Paris. This is the immense Art Building constructed for the Exposition of 1900 and since used for the annual Salons. The great central space, with its iron and glass cupola larger than any dome, and considered a triumph of French engineering, could never be heated. So the surrounding galleries have been hermetically closed off by painted canvas; and 1,200 beds, with laboratories, kitchens, doctors' and nurses' rooms, and all the appurtenances of a commodious hospital, have been installed in the hundreds of halls intended for finer, if not so useful, arts.

The difficulties of instalment were greater than in the American Hospital Ambulance, which has room for 1,000 beds of surgical cases. That took over the very large new college, never yet occupied, of the Paris suburb of Neuilly. It had been intended from the beginning for human habitation. Several Americans, like other rich inhabitants of France, have fitted up their city houses or country châteaux with complete hospital instalments, attendant physicians and surgeons and nurses. The British Hospital organized its ambulance in the palatial Trianon Hotel of Versailles; and many large Paris hotels, in whole or in part, have been given over to the same purpose. But all is still insufficient in this kill of French and British and German soldiers. Germans should be added, although Senator Clemenceau maintained in his suppressed newspaper that they should not have first chance and choice. The French, at least, have for working principle that all wounded soldiers, of whatever sort, are men. If some such principle could be practiced in time of peace, the world might be saved from all this inhumanity of war.

Dr. César Roux, a distinguished Swiss surgeon, well known to many Americans who have visited Lausanne to consult him, has given his services for some time to the Important French military hospital at Besançon. He says he was led to do so by something more than the feeling of humanity and devotedness to near neighbors and friends of the frontier. "I needed to get away from the atmosphere of depression and inactivity pervading us in Switzerland during the first weeks of the European conflict. I have been comforted by contact with a population that has kept, with its coolness and good humor, all its confidence in the future. Even the state of mind of the wounded seems to me worthy of being proposed as an example to the healthy people of our own country. In the great halls where their beds are lined up, there is not a complaint nor a murmur. Each one is only waiting to be well again and again serve his country."

Science

THE RECONCILIATION OF SCIENCE AND PHILOSOPHY.

Perception, Physics, and Reality. By C. D. Broad, M.A. Cambridge University Press; G. P. Putnam's Sons. $3 net.

The present is a period of unusually rapid advance in the knowledge of physical phenomena and in ferment of ideas. Old and well-established postulates of physics are under examination and new hypotheses are proposed. Naturally, philosophers are watching this unrest with keen interest, and are beginning anew the task of reconciling science and philosophy. The essay of Mr. Broad, which was originally presented to Trinity College, Cambridge, as a dissertation at the examination for fellowships, is an attempt to discover how much natural science, here meaning physics, can tell us about the nature of reality. And since many philosophers doubt its capability to tell us anything about reality, the assumptions of physics are also investigated.

The prime difficulty in a discussion of this kind is to determine what is meant by *the real*. If that remains obscure, then no amount of rigorous deduction can remove the obscurity of the postulate. And it may be questioned whether Mr. Broad has been able to impart to his readers the exact idea of reality which he himself has. He acknowledges the assistance he has obtained from Mr. Bertrand Russell's views on Causality as given in the "Principles of Mathematics." But it is very doubtful if Mr. Russell's philosophical method aids clarity of thought. As is well known, he substitutes mathematical symbols for ideas and propositions, and derives his conclusions by mathematical analysis. We may take an example from Mr. Broad's essay. Let p be the proposition, phenomenalism is true. Let q be the proposition that the objects of our perceptions depend on the structure of our organs. Can we prove p from this, *i. e.*, can we at the same time assert $\prime\prime$ and $q \supset p$? The proof is: asserting the proposition $p \supset \backsim q$, and with $q \supset p$, we get $\prime\prime \supset \backsim q$. But $q \supset \backsim q \supset \backsim q$. Hence $q \supset p \supset \backsim \prime\prime$ Thus to assert both $\supset \prime\prime$ and q would involve the assertion of both q and $\backsim q$, which is impossible. This is evidently a proof of the theorem, that if objects are dependent on us, we cannot derive from it the proposition that phenomenalism is true. The question now is not so much whether the logic is good, or is made more tangible by using this extremely irritating style, but whether or not we have gained a clearer idea of phenomenalism, of reality, and of their connection by using p and q, and mathematical symbolism.

Suppose during the analysis our ideas of reality change somewhat, or even become confused, which is not unlikely, considering the complexity of the proposition, objects are dependent on the structure of our organs. If the idea changes, so also must the symbol; and following the custom of mathematicians, q becomes q', and our conclusions are to say the least doubtful. The reason why mathematics can be applied so successfully to physics is because, if q represents, say, a velocity, the idea is so simple and can be measured with such accuracy, that throughout a problem the writer's idea remains unchanged and can be imparted to his readers with certainty. Mr. Broad uses this method to some extent, but he departs from it in putting his conclusions in terms of probability rather than of certainty. He even says that Kant was most unfortunate in holding that philosophy deals only with certainty and not with probability. It may be added that if philosophy does deal with certainty, then certainty is a devious and intersected path.

The first and most important chapter of the essay is devoted to a discussion of the realistic point of view. From his observation that most scientists start from a position of naïf realism, Mr. Broad reasons that they can hardly avoid this attitude, however it may be obscured by a study of phenomenalism. The distinction between naïf realism and phenomenalism is defined in the following terms:

> The point of difference, of course, is that the naïf realist maintains that in perception we are directly aware of what would equally exist and be unaltered in any of its qualities at the moment at which we perceive it even if we did not perceive it, while the pure phenomenalist holds that what can be perceived must be perceived, and that nothing exists except mental states and the objects of those of them which are perceptions so long as they remain objects of them. The point of resemblance is that neither the phenomenalist nor the naïf realist can admit appearance or illusion.

This definition shows rather well that it would be somewhat difficult to compress phenomenalism into p and reality into q, and carry these symbols with any certainty through a long argument.

Not only does the scientist maintain an attitude of naïf realism, but it is difficult to see how he can adopt any other as a basis for science and keep free from subjective metaphysics. Putting this idea crudely, the physicist feels assured that he himself exists, and that certain of his sensations within him are real. With somewhat less assurance other objects, distinct from himself and independent of his existence, seem real to him; so real that the objects can be described to another person, who does not perceive them, with such accuracy that they can generally be distinguished when later they are perceived. The link between the individual and the object is a question for the philosopher, and apparently the argument over the nature of reality and the validity of the scientific point of view is endless and not likely to be settled.

Mr. Broad's discussion of the arguments against naïf realism is very thorough. His conclusions are that some of them are futile and none of them make it absolutely impossible. His analysis of the evidence given by the different organs of sense is

keen. It can hardly be denied that some of them, notably sight and touch, are so much more definite that we instinctively refer the qualities of color and extension to the objects producing the sensation; while, on the contrary, such sensations as taste and smell are indefinite and are referred to the organs excited. For example, "Common-sense finds it almost impossible to conceive of an unsmelled smell or an untasted taste, but finds little difficulty in an unseen color and none in an unseen figure."

Two chapters are then devoted to phenomenalism and its causal theories. This doctrine, which has become very popular since the time of Mach, Mr. Broad accounts inadequate for a philosophic basis of science, and he counsels us to preserve an attitude of agnosticism towards the real causes of our perceptions. Although Mr. Broad gives good reasons for the advisability of this agnosticism, he fails to emphasize what is perhaps the best reason. For, however attractive the philosophy of phenomenalism may be because of the readiness with which it lends itself to mathematical analysis, it has the fatal tendency of projecting the theory of science into metaphysical speculation. The belief in the existence of matter may make us naïve, but it does at least keep our feet on the ground. When we try to substitute energy for matter, we drift into the abstract formulæ of the school of energetics, and when we exalt the attribute electricity into a world-stuff we lapse into the transcendental symbolism of relativity. These substitutions are repugnant to our common-sense, and in the end the experience of our sensations will prevail in science. None but the specialist will be satisfied to wrench our world of matter and sensations to satisfy a mathematical formula. Bacon gave a permanent warning when he stated that the function of mathematics was to follow phenomena and not to create them.

The essay closes with a discussion of the modifications which must be made in Newtonian mechanics if the modern hypotheses of electricity and relativity are accepted. Mr. Broad maintains a conservative position. His opinion, that further experience may teach us that the Newtonian laws of mechanics are only approximations, might be assumed from the fixed belief of physicists, although we sometimes dislike to admit it, that all scientific laws are laws of probability or approximation, and not of certainty. His final conclusion is sane, and shows the value of the book, especially now when both science and philosophy are tending to turn back to mediæval metaphysics:

> But [these] more general laws will still be laws about positions and velocities of some extended quality or qualities, and, as such, will be capable of the same sort of defence that I have offered for the traditional mechanical physics; that, although its laws were deduced from experiments made with appearances, they are transcriptions of the laws that hold among the real causes of our perceptions of appearances, and among the relations of these real causes to each other in a real spatial counterpart.

Drama

"THE DYNASTS" ON THE STAGE.

A NOTABLE COLLABORATION OF THOMAS HARDY AND GRANVILLE BARKER.

By WILLIAM ARCHER.

LONDON, November 26.

It was not without misgiving that even the warmest admirers of Thomas Hardy and of Mr. Granville Barker heard of the projected presentation at the Kingsway Theatre of an abridged version of "The Dynasts." It seemed too gigantic a task even for Mr. Barker's energy and scenic skill. As one re-read Mr. Hardy's text, with its nineteen acts, its 130 scenes, and its two or three hundred speaking characters, to say nothing of crowds, parliaments, and armies, one was much more impressed by the scenic impossibilities than by the dramatic possibilities of the great epic in dialogue. It was magnificent, but it was not drama. And then there was the supernatural machinery: that hovering chorus of "Phantom Intelligences"—the Spirit of the Years, the Spirit of the Pities, the Spirits Sinister and Ironic, the Recording Angels, and other fearful wildfowl, to whom the poet has assigned the task of shedding upon the world-historic spectacle the searchlights of his pessimistic philosophy. How were these aerial phantasms to be treated? It might have been possible, no doubt, simply to omit them; but to this Mr. Hardy would scarcely have consented; and, besides, the action without its lyric accompaniments would have been like a libretto without its music.

Last night's production had not far advanced before we realized that Mr. Barker's daring was more than justified. He had shown admirable tact and ingenuity in grappling with a problem with regard to which he had no precedents to guide him. Reducing Mr. Hardy's text to perhaps one-tenth of its whole bulk, he had given it a species of unity by selecting those scenes in which England and Englishmen are most directly concerned; and for the presentation of these episodes he had invented a new scenic framework and, as it were, a new organ of epic-dramatic expression. Never did producer more truly collaborate with his author than Mr. Barker with Mr. Hardy; yet he has done it without thrusting his own inventions into the foreground, after the fashion of those actor-managers who inflict their collaboration upon the defenceless Shakespeare.

When all is said and done, however, Mr. Barker's methods are not really new. They are as old as the Elizabethan stage on the one hand, and the Japanese stage on the other. I do not know how far Mr. Barker was conscious of following these models. Of the Japanese stage, at any rate, he had probably no thought whatever. Yet his treatment of the mythology of the "The Dynasts" was as Japanese as his treatment of the historic episodes was Elizabethan.

When we entered the theatre, we were confronted by a specially constructed proscenium of plain gray, filled in with gray curtains. Against each of the raking panels of the proscenium was placed an elevated throne; while from the narrow apron in front of the curtains converging flights of steps led down to a stone seat with a sort of stone lectern before it. The architectural proportions of the whole structure were very pleasing. Presently the curtains opened in the middle and through them came two stately muse-like ladies (Miss Esmé Beringer and Miss Carrie Haase), who proceeded to occupy the two thrones, and Mr. Henry Ainley, in Georgian attire, with a gray academic gown, who stepped down and seated himself at the lectern, facing the audience. To these three personages, the dual chorus and the single reader, were assigned the lyrical, philosophical, and narrative portions of the production. The two Muses, as they naturally would, spoke in verse, while the Reader, speaking for the most part in prose, supplied what may be called the connective tissue for the episodes, or the thread on which they were strung. He read, in short, Mr. Hardy's elaborate and characteristic stage-directions, to some extent rewritten, I imagine, for the occasion.

Now these lyrical comments and spoken stage-directions are established institutions of the Japanese stage, though in Japan the performers are seated, not in front of the proscenium, but in the wing. And I take it that the reason for their employment is much the same in both cases—namely, that we have to deal with a form of drama imperfectly differentiated from the epic, like one of the modern statues which are left but hazily emergent from the marble block. It cannot be said that the Muses insisted unduly on Mr. Hardy's philosophy. Only once, towards the end, did we hear anything about the Immanent Will. Most of the interludes were, I think, selected from the utterances of the Spirit of the Pities, so that their general effect was simply to give voice to that intense compassion which is, indeed, the essence of Mr. Hardy's criticism of life. At the very end, one was astonished to hear the Muses break forth into a hymn of almost jubilant optimism, suggesting the song of the Archangels at the beginning of "Faust." On reference to the text, it appeared that this pæan of the Pities was hypothetical rather than affirmative—the hymn they would have liked to sing had the world been ordered otherwise. Chanted without this proviso, it seemed rather to contradict all that had gone before; yet most of us were willing to condone the inconsistency for the sake of a ray of light through the clouds.

So much for the supernatural marginalia, if I may so call them. When the curtains opened, they revealed a stage arranged in almost exact accordance with the most recent reconstructions of the Elizabethan theatre: two side-walls slanting backwards, an entrance-way in each, and between the two entrances a slightly raised inner stage, or alcove, to which the walls served as a

proscenium-frame. The only feature of the Elizabethan stage that was lacking was the upper gallery or balcony over the inner stage; and there were one or two passages where one felt that Mr. Barker might have employed this feature, too, with excellent effect. Furthermore, he used his two stages quite in the Elizabethan fashion. On the front stage he placed no scenery, but only properties; while the back stage, by the simplest appliances, was occasionally converted into what we moderns call a scene, figuring, for instance, the cockpit of the Victory, or the anteroom at Fontainebleau, where Napoleon signed his abdication. By this means an admirable rapidity of action was attained. The short interspaces between the episodes were filled by the Chorus and the Reader, so that the attention was always agreeably occupied—a point of no small moment where there was no inner cohesion between the episodes, and no interest of plot to carry the mind forward. Or, rather, the interest of plot lay in that great historic movement which it was precisely the business of the lyric and narrative interludes to suggest. One very stirring episode, by the way—the Battle of Albuera—was treated entirely as a recitation by the three Presenters, as they would have been called in Shakespeare's time.

Whether by reflection or by instinct, Mr. Barker certainly did exactly the right thing in giving "The Dynasts" an Elizabethan setting. For, apart from its philosophic marginalia, the poem is nothing but a gigantic chronicle-play. We can trace its ancestry right back, through "Sejanus" and "Catiline," through "Henry IV" and "Henry V," to "Edward II" and "Tamburlaine the Great." Its curiously bombastic style, which has probably frightened off a good many impatient readers, is a remarkable testimony to the enduring influence of the Elizabethan tradition—an influence both for good and ill; certainly not for good when it leads to Napoleon's talking like this:

> Tiptoed Assassination haunting round
> In unthought thoroughfares, the near success
> Of Staps the madman, argue to forbid
> The riskful blood of my previsioned line
> And potence for dynastic empery
> To linger vialled in my veins alone.

There perhaps never was a great poet—for a great poet Thomas Hardy surely is—who was so helpless and lumbering in his use of language. Yet, take it all in all, performance tends to justify the Elizabethan form. Even though the verse be sometimes nothing but prose denaturalized and cut into lengths, we feel that it is possible to do in verse things which could not be done in prose. The verse reminds us that it is not the actual scene, but its highly-compressed essence which the poet is presenting. It puts realism out of court and gives atmosphere to what might otherwise seem little better than a cinematographic panorama. It enables us, for instance, to see Nelson pacing the quarterdeck of the Victory at Trafalgar, and scarcely to notice that, though broadsides and musketry are freely talked of, they are not represented to the ear by so much as a drum-tap or the popping of a child's pistol. And, even when the matter is most prosaic, a certain "use in measured language lies." It lends crispness, precision, and weight to dialogue. It brings out the true dignity of events which the commonplace associations of prose would tend to obscure.

The stage version, like the complete text, falls into three parts: "Trafalgar," "The Peninsula," and "Waterloo." The first part, of course, culminates in the death of Nelson, presented pictorially on the inner stage, with admirable simplicity and dignity. In the second part we have the death and burial of Sir John Moore, the Battle of Salamanca, and the scene of Napoleon's abdication. The third part shows us the Duchess of Richmond's ball, the departure of the troops from Brussels, and the crucial passages of the most dramatic battle in history. It seems to me that, in his complete text, Mr. Hardy achieves a unique imaginative feat—he makes you live through the battle with a sort of breathless suspense, as though you were really in doubt as to its issue. Something of this effect is lost in the stage abbreviation, which remains, however, intensely interesting. Mr. Sydney Valentine, an actor well known in America, gives a very strong and clear-cut portraiture of Napoleon. In the other parts there is not sufficient continuity to allow much scope for distinction, but the performance as a whole was more than competent. I must not omit to mention that Mr. Barker had wisely retained several of those interludes of Wessex rusticity in which Mr. Hardy is so peculiarly at home. They afforded the sort of relief which the Falstaff scenes give to "Henry IV" and the humors of Pistol, Bardolph, and Fluellen to "Henry V."

Perhaps the reader may question whether it is really opportune in war-time to revive the memory of

> Old, unhappy, far-off things,
> And battles long ago.

Well, it is certainly a mixed pleasure to have the horrors of war brought home to us in imagination while the cold reality of them is every day haunting our minds. But, apart from the æsthetic satisfaction to be derived from so bold and original an effort of stagecraft, it is wholesome to be reminded that our fathers, in their day, lived through anxieties no less tense and terrible than those we are undergoing. As Mr. Hardy says in his Prologue, the production is designed

> To raise up visions of historic wars
> Which taxed the endurance of our ancestors,
> That such reminders of the feats they did
> May stouten hearts now strained by issues hid.

Yes, we are too apt to forget that Trafalgar and Waterloo were "issues hid" while the Immanent Will was slowly working itself out, and that the dash of Sir John Moore into Spain, which we now see to have been almost the turning-point of Napoleon's fortunes, seemed, to the men of that day, something not very far from a disaster.

"THE MARRIAGE OF KITTY."

Pleasure at seeing an old favorite successfully revived is somewhat tempered by regret that audiences appear inclined to accord to this piece a good deal warmer welcome than was vouchsafed to a far better play in the répertoire of the same company. "Mary Goes First," a comedy of notable constructive skill, struggled on with no overwhelming success for a few weeks; "The Marriage of Kitty," a farce of excellent good humor but of little outstanding dramatic merit, seems likely, if one may judge from its reception by a delighted audience on the second night, to repeat in some degree the vogue that it enjoyed on its original production.

The laugh in "The Marriage of Kitty" is easily raised; the fun is broad and obvious. When Madame de Semiano is revived from a fit of hysterics by a clapping of the hands on the part of Sir Reginald Belsize and John Travers, the effect is undeniably mirth-provoking and quite legitimate to farce, but it cannot be pretended that it is difficult to produce or that it makes any strenuous demand on the artistic intelligence of the players. The characters in "Mary Goes First," with the exception of Mary herself, who, as portrayed by Miss Tempest, was delightful, were played passably well, but not by any means as well as they might have been. "The Marriage of Kitty" is a far easier play to interpret, and the general level of the performance is consequently a great deal higher.

The plot of this amusing piece of foolery, adapted by Cosmo Gordon Lennox from the French of Fred de Grésac and François de Croisset, being familiar, need not be recapitulated. In addition to the Kitty of Miss Marie Tempest, which is as sprightly as ever, we may mention for commendation the Sir Reginald Belsize of W. Graham Browne, the Madame de Semiano of Miss Katharine Kaelred, and the John Travers of Herbert Ross.

"The Marriage of Kitty" was preceded at the Comedy Theatre by a one-act play by Harold Chapin, entitled "The Dumb and the Blind," which might easily with a little ingenuity have been made into something of real dramatic merit, but which in its present form consists merely of a character study of a bargee, admirably rendered by W. Graham Browne, and violates the canons of dramatic composition as laid down by Aristotle in not having a beginning, a middle, or an end.

S. W.

"DRIVEN."

"What it means to a woman"—that formula which is supposed to mean so much—receives attention yet again in E. Temple Thurston's new drama, "Driven," which is played at the Empire Theatre. In this incarnation the meaning gets a special setting from the fact that the woman has only two years to live, owing to some ailment to which no name is given. That in such circumstances her husband, who is engrossed in his work as an M.P., should have little or no time to devote to the frivolity which she craves, is of course tragic enough; and it was possible, with this situation, to make the impulse which she has to love and be loved in an irregular way seem cogent. But the play, as it stands is poorly constructed and poorly elaborated. Certainly if the piece is to

last, something must be done with the piddling first act, wherein the young wife, eavesdropping, hears her fate from the physicians called in for consultation. Here the "tragedy" is achieved largely by continuous iteration of the words "two years"! Even this would not have been so bad if Miss Alexandra Carlisle, who plays the part of the wife, had shown any variety of expression. As it was, the audience got merely the uncomfortable impression that the play was going to be pretty long. And it was long indeed.

One need not give the plot in detail. It is marked by the usual procedure. After being on the point of committing her welfare to the arms of her lover, the wife discovers that the lover, though outwardly a gentleman, is at heart a cad. This revelation of his inward self is, by the way, a very sudden bit of business; and though virtue triumphs, the victory is at the expense of the only character on the stage who by his finish really holds the audience's attention. It may be added that Diana in six months is pronounced cured and returns to the love of her husband, who, at the suggestion of his sister, a sanctimonious old thing, presents his wife with a Pekingese dog, and thereby convinces her that he at length understands her. F.

"And So They Were Married," a comedy of the new woman by Jesse Lynch Williams (Scribner), is a clever and entertaining play, of which the main theme is the profanation of the religious ideal in the mercenary marriage. It mixes much pungent and familiar truth with a good deal of shallow generalization. Like many other pieces of its class it seeks to establish broad deductions upon specially invented instances. But it is an ingenious bit of special pleading up to the point where it shrinks from the logical result of its own thesis. The heroine, a feminine individualist of the highest intellectual type, is passionately in love with a brilliant young medical scientist, of moderate means, to whom she is assistant, but will not marry him, partly because she believes that the contract implied in a ceremony is fatal to love, and immoral when love has died, and partly because the obligations entailed by it upon the man would hinder or block his professional advancement. She is willing, however, to link her fate with his as his mistress. The scientist, as much in love as she is, but more worldly wise, refuses to accept such a sacrifice, declaring that they must marry or part. In the end the scientist is forced, by specially devised but plausible circumstances, to accept the heroine's terms, on the understanding that a formal announcement of their determination to dispense with legal forms shall be made at a sort of family council. When this has been convened they revolt successfully at an attempt to entrap them into a religious ceremony—in which the Church is made to play a most despicable part—but are wed most effectually by an astute old judge who extracts from them all the public declaration necessary to the civil process. They readily attest their union by a solemn oath, thus virtually subscribing to the obligation against which they were in professed revolt. This is a lame and impotent conclusion, a case of much ado about nothing. What the play lacks is breadth of view and reflection. In its zeal for a modified marriage for the new woman it overlooks the handicaps of nature and the fact that any approach to free love would increase the liberties and opportunities of men while greatly multiplying the dangers and responsibilities of women.

What a deal Shakespeare had learned by 1604! "He had concepts of a catastrophe, a protagonist and antagonist at struggle, a keynote scene, a rise to a well-defined mental crisis, a crisis-emphasis including a tragic incident, the arrest of the catastrophe," and so on. In spite of these astonishing attainments he was "conscious of needing . . . structural unity, or, as he thought of it, probably, command over the interim between the crisis-emphasis group of scenes and the catastrophe group." Such amazing self-consciousness was in part the result of "Julius Cæsar." He "became interested in the Senecan pair of debaters in his study of Brutus and Cassius, but he could not stop then to develop all the dramatic possibilities." This Shakespeare, whose hobby is a more than German passion for technique, is created by Dr. Harriott Ely Fansler in "The Evolution of Technic in Elizabethan Tragedy" (Chicago: Row, Peterson & Company; $1.25). The notion of Shakespeare's passing from play to play in an effort to solve in succession technical problems is in reality more amusing than Professor Dowden's surmise that he carried through the writing of the histories to provide himself with a guide to the successful conduct of life. Yet it is developed in a serious, almost fanatic, mood, by minute analysis, with an eye single to the glory of Freytag and a mind filled to overflowing with his special terminology. In fact, the author displays an ingenuity unsurpassed even by the Baconian enthusiasts; where no one else has been able to detect evidence of any preconceptions regarding dramatic forms or any continuous interest in rules and schemes of structure, she reveals Shakespeare's life-long absorption in nineteenth-century German theory of tragedy.

In the reprint of Hannah Lynch's translation of "El Gran Galeoto" of Echegaray (Doubleday; 75 cents net), the Drama League worthily continues its work of making accessible to English readers representative plays of the best foreign authors. José Echegaray is recognized as the leading dramatist in Spain to-day. His literary fame, moreover, has not been confined to Spanish-speaking countries. In 1905 the Nobel Prize for literature was divided between him and Frédéric Mistral. Translations of his plays have been made into several languages, and are holding their place in the contemporary theatre. Of recent interest is Echegaray's translation from the Catalán of Guimerá's "Maria Rosa," played last winter at the Longacre Theatre. "Maria Rosa," an emotional drama of the Catalonian mountains, was passed upon by the Drama League, and of the fifty-five productions judged won a place upon the list of fifteen plays worth publicity. Four of Echegaray's plays, "The Son of Don Juan" and "Mariana" (the translations of James Graham), "The Great Galeoto," and "Folly or Saintliness" (the translations of Hannah Lynch), were published in Boston. An adaptation of "The Great Galeoto" was made by Nirdlinger and played under the title of "The World and His Wife." We have another translation by Caroline Sheldon, whose version was presented at Grinnell College in 1912. The present translation is not free from occasional inaccuracies, and there is perhaps some lowering of tone. Nevertheless, the Drama League does good service in publishing this attractive volume.

Art

STYLIST AND ÆSTHETE.

Second Characters, or the Language of Forms. By the Right Honourable Anthony, Earl of Shaftesbury. Edited by Benjamin Rand. New York: G. P. Putnam's Sons. $2.50 net.

We are not often permitted a glimpse into the workshop of a great writer, and when this writer has been dead two hundred years, the experience is tinged with romance. The third Earl of Shaftesbury, philosopher and author of "Characteristics," died in Naples in 1713, and in 1913 Dr. Benjamin Rand, head of the Robbins Philosophical Library of Harvard University, discovered among the papers in the Record Office in London Shaftesbury's "Second Characteristics," and published them at the University Press, Cambridge.

The book consists of four treatises, of which the first two, "A Letter Concerning Design" and "A Notion of the Historical Draught of Hercules," had been previously printed. The third, or rather a translation of a Greek passage on which it was to be based, and the fourth, "Plastics," are published for the first time. In addition Dr. Rand prints all the notes, directions for the title-page and the illustrations, a preface, and an "Idea of the Work," in which Shaftesbury laid down definite rules for his own guidance.

The "Idea" might be called a "Rhetoric or Composition Book" such as is studied in our colleges to-day:

> A right rule, viz.: To begin each Part with a deeper breath, distinguishable from the subaltern sallies or excursions in the mere sections into which the main parts are divided (page 5).
>
> A rule, viz.: Nothing in the text but what shall be of easy, smooth, and polite reading, without seeming difficulty, or hard study; so that the better and gentler rank of painters and artists, the ladies, beaux, courtly gentlemen, and more refined sort of country and town wits, and notable talkers may comprehend, or be persuaded that they comprehend, what is there written in the text.

On the same page Shaftesbury warns against the frequent use of "I," and urges the substitution of the "fashionable one, from the French *on*." On page 10 he suggests that the first chapter of a serious book should contain thoughts—

> which the reader with little study may discover, and applaud himself for it, believing the rest easy. So that it is in the next following chapters that the maxims, or deep precepts, theorems, etc., may be couched, and so delivered, that what surpasses the ignorant reader may pass him by, without reproaching him his defect, or frightening him with the supposed profoundness of the sense or reading.

The copious notes and appendices of the MS., all of which are given in Dr. Rand's edition, were not intended by Shaftesbury to be printed in their entirety; for they, too, contain frequent hints either for himself or

for whosoever should give the final polish to his first draught of "Plastics." Shaftesbury was the first English writer on the great problems of art, and found an insufficient vocabulary at his disposal. Some new words he coined outright and used freely, because their meanings were clear; others he used tentatively and only in certain connections which he hoped would explain them. Very interesting is his desire to substitute (p. 180) *virtual* for *virtuous*, "which last cannot be used for the energetic in the good sense." One of his new words has again disappeared from the English language without there having been found a substitute, except the cumbersome "easel-picture." Shaftesbury called such pictures *tablatures*, to distinguish them from pictures painted in the places where they were to be seen—walls, ceilings, doors, and the like.

Other notes are full of reminders to look up references, to search for appropriate quotations, or to make sure that a given statement is correct. All in all, there is probably no other book which reveals one of the great literary men of two hundred years ago so intimately at work as Dr. Rand's edition of the "Second Characters." This fact alone would make the book valuable, but it sinks into insignificance before Shaftesbury's searching investigation into the true principles of art.

Written at a time when the state of art in the world, judged by its output of visible art, was low, the maxims laid down by Shaftesbury are as valid to-day as they ever were, and will be recognized by our greatest writers and painters as true and singularly well expressed. Generally Shaftesbury had the unfortunate habit of polishing his sentences to their utmost before sending his manuscripts to the printer. In these "Plastics," however, he did not advance beyond the first draught, and this enables us "to catch him," as Edmund Gosse says, "before the magnificent and slightly fatuous toilet is completed, before his nouns have found their verbs, and while his epithets are still competing for selection." This makes the "Plastics" not always easy reading, but it conveys the *flatus dei*, and makes Shaftesbury's enthusiasm for true art almost catching.

His general theory was that good art is as natural an expression of man as political and individual freedom is his natural state. Where there is no freedom, no *enjoyment* of freedom, there can be no art, because you cannot express yourself naturally under unnatural conditions. Art, moreover, is not finite, for it always means and conveys more than it reveals. Nor are the principles of art unrelated to those of ethics. This, however, he wisely refrained from stating in so many words in the "Plastics," for it would have offended many readers. But in his "Idea" (p. 6) he says:

> Remember still, this the idea of the work, viz.: *Quasi*. The vehicle of other problems, *i. e.*, the precepts, demonstrations, etc., of real ethics. But this hid: not to be said except darkly or pleasantly, with raillery upon self, or some such indirect way. . . .

Starting out with the observation that "all men *mimic*, else no speech, no manners," and that nothing is "more pleasant to human nature from the beginning than learning," he proceeds to an exhaustive discussion of a variety of principles of art:

> The didactive or preceptive way being unartificial, un-masterly, and un-poctic: not Homerical, though Virgilian. . . . This the province of the philosopher, the rhetorician, the historian: not the bard, the *vates*, the enthusiast (page 97).

> The finer and more delicate imitation is the more tender, and by nicest . . . touches in poetry as in painting, and not by exaggeration, amplification, straining, tightening, overcharging. . . . So a sordid painter first chooses a mean blemish and not a true one in manners. . . . On which very thing depends the difference between Horace and Juvenal (page 100).

> Bad figures: bad minds. Crooked designs: crooked fancies. No designs; no thought. No imitation: no poetry (page 105). Thus the species of horses and other animals, the kind being once seen . . . the idea of beauty and perfection is raised, and when reduced to this idea of instinct by the able artist, recognized presently by the good eye of every spectator (page 108).

Unfortunately, the good eye, *i. e.*, the good taste in art, is subject to a number of corrupting influences, of which Shaftesbury mentions four in particular: (1) bad art frequently seen; (2) haste and hurry of living; (3) vice and corruption; and (4) the "want of nudidity," the lack of "opportunity of viewing forms of the finer sort (not professional models) in nudity, and in easy, familiar, as well as strenuous exercising action." "The great business," however, "in this as in the whole of life is to correct our taste," and "the artificial, witty, far-fetched, refined, hypercritical taste is the worst in the world" (p. 115), because it is the result of conceit and ignorance.

Ignorance, in fact, Shaftesbury believed was the cause of the low state of art in his time:

> Modern masters no learning. No converse till after raised and known by their pencil, and then too late. Illiberal. Dis-ingeneous. Sharks, rakes. What ideas, when thus vulgar! Not even so high as what we call good breeding and manners in a common sense! . . . Yet these give the clue and lead the great, who are cheated as well as misled by these mechanic knaves! (page 129).

Such men were, of course, unable to come up to the standard of true art, where "all is invention (the first part of painting), creation, divining, a sort of prophesying and inspiration, the poetical ecstatic and rapture. Things that were never seen, yet feigned. Painter as poet, a second maker."

Shaftesbury wisely guarded himself against the attacks which *mere* painters always make against those who defend the divine side of art, viz., "that they know nothing of the technical side of painting," by including in his work several chapters on this subject. We know from his letters that he had frequent interviews with painters in Naples, where he spent the last year of his life engaged in writing "The Second Characters," and that one artist lived in his house. These chapters may, therefore, be regarded as expressing the ideas and practices of the painters two hundred years ago. We learn there that they used practically the identical colors which are used to-day with the one exception of vermillion; and that even our most advanced modern painters still follow the mechanical processes of mixing their pigments that were practiced then.

If there are few statements by Shaftesbury of the principles of art with which the student of to-day would be willing to quarrel, his estimate of individual pictures and artists is often open to criticism. He was a great admirer of Raphael, Michelangelo, Titian, and Poussin, but also of Domenichino, whose picture of St. Jerome he calls the best in the world. Rubens and the Dutch and Flemish genre painters, especially those of peasant life, he abhorred, and while he had a kind word for Closterman, he said that Van Dyck was "fantastic, apish, antic in his action, and wretched and false in his composition, collocation, etc." Rembrandt, Franz Hals, Holbein, Velasquez, and many important Italians are not even mentioned. This may seem strange at first, but it becomes natural when one reflects that Shaftesbury was far more interested in the abstract principles of art than in actual pictures. He passed through Paris, the Lombardy, Florence, and Rome on his way to Naples, and being a very sick man, could not visit any museums or galleries. In his many letters from Naples (published by Dr. Rand in 1900) there is not one word of regret at having been unable to do so, while there are expressions of regret at not having been able to call on this man or that man in the cities through which he had passed.

Great praise is due to the University Press for the beautiful garb in which "The Second Characters" has been issued. As frontispiece is printed an engraving after Closterman's portrait of the Earl of Shaftesbury. The painting itself, it seems, has disappeared. Possibly it was one of the several paintings which the painter Fran de Gruter removed to Amsterdam in 1711 after the death of Closterman. These paintings were later attached by a court order, according to recently discovered records (see Thieme-Becker, Künstler-Lexicon, VII, p. 116).

Dr. Rand's Introduction is a masterpiece of concise presentation of facts needed for an intelligent enjoyment of the book. His skilful editorship is everywhere apparent. There are copious cross references, an "Index of Ease," and bracketed translations of all Latin and Greek quotations. The translations serve their purpose, but at times miss their point. "Docti rationem artis intellegunt, indocti voluptatem," which means that the learned enjoy the principles of art, and the unlearned the beauty of the work of art, is translated: "The learned understand the art of composition, the unlearned enjoy pleasure from it."

When Dr. Rand has done so much it may be ungracious to ask for more, but the wish is a natural one that he should find the

time to rewrite "The Plastics" as Shaftesbury wished they should be rewritten for publication, to rearrange the several chapters, and to "translate" into present-day English some of the more difficult passages. If he should do this, the book would be one of the most valuable, instructive, and enjoyable treatises on art, and one which might help people to reach a juster appreciation of true art than they seem to possess at present.

Emma Louise Parry's "The Two Great Art Epochs" (McClurg; $2 net) is the kind of equable compilation that seems to be in steady demand among schools and clubs. The drawbacks of the type are exemplified in inaccuracies in the accounts of Duccio, Masolino, and Perugino, in the choice of the worst Discobolus, that of the Vatican, for illustration, in the omission of the Hagias under Lysippus. Giorgione's name was not Barbarelli. On page 228 are three blunders in six lines. Such infelicities will occur so long as specialists are unable or unwilling to write our popular manuals, and publishers are too parsimonious to pay for expert supervision of such compilations. The present volume is clearly written, fully illustrated, and by no means bad of its sort.

Finance

END-OF-THE-YEAR MARKETS.

As the year draws to a close, and the fifth consecutive month of the European war is nearly ended, the American financial markets are moving in a suggestive and interesting way. The stock market, after its vigorous advance on the reopening of the Exchange, and after the rather speedy downward reaction, has fallen into a state of uncertainty. Confronted on the one hand by an undoubtedly strong demand from American investors, and on the other by the continued doubt as to whether foreign investors would not sell on any inviting rise in prices, the market seemed to have become in a sense between comparatively narrow limits of prices. Even last Friday's decision of the rate case, in favor of the railways, gave only a temporary stimulus to the rise.

This may have meant that financial judgment as to intrinsic values has not yet been determined—especially as prices still hold well above those of July 30, when the Stock Exchange closed its doors. But in other branches of the financial markets, judgment has been more emphatically pronounced. Money rates, to begin with, have returned to by far the lowest level since the war began—in fact, to what even in ordinary times would be called "easy money." Official rediscount rates at the Federal Reserve Banks have been reduced fully 2 per cent.

Yet, in spite of this absence of anything like a bid for European capital, international exchange has moved decisively in this country's favor. Exchange on London, which in August and September held so long at rates exorbitantly high, has this week declined to the lowest level since last February; a level not far distant from the normal gold-import point. This notable movement is ascribed, first to the large remittances of gold already made by us to Europe, but also, and perhaps chiefly, to the expanding export movement. Even in October the country's excess of exports fell $81,600,000 under 1913. In November, it was only $17,700,000 smaller. This month, with Europe's purchases of materials very large, with grain still going out on an unprecedented scale, and with cotton exports last week matching those of a year ago (whereas in August they were barely 10 per cent. of 1913), the influence of our outward trade in merchandise is undoubtedly much more positive.

Not least in importance among the movements on the markets has been the rise in wheat, this week, to a price higher than was reached even in the excited "war speculation" of September. This rise is partly recognition of the continued and very heavy European buying. But it is also based on some new calculations for the immediate future. Last Thursday the Government gave out its estimate on condition and acreage of our newly planted winter wheat crop. The figures brought both reassurance and disappointment. The crop's condition is the lowest of any December since 1911—9 per cent. under last December, and nearly 3 per cent. below the ten-year average. Yet, on the other hand, the planted area is 11⅛ per cent. greater than a year ago, and 20¾ per cent. above any previous planting.

There are statisticians here who figure that the higher acreage so far offsets the lower condition as to indicate a yield of 689,000,000 bushels, as against 690,000,000 this past season. But "December forecasts" are a notoriously dangerous reliance, and the fall in the crop's condition percentage in Kansas to 80, as against 100 last December, inspires some caution. As a general rule, the grain trade is inclined to regard the outlook for the next winter wheat crop as decidedly poorer than a year ago.

Even if our own crop were to fulfil the tentative estimate just cited, it does not seem possible for the world's wheat crop of 1915 to equal that of 1914—though this year's total, despite the huge American harvest, fell 386,000,000 bushels short of 1913. The new acreage in France, Germany, Austria-Hungary, Belgium, and the Balkan States, also in Holland and parts of Russia, is almost sure to be greatly reduced, as a result of the drafting of able-bodied farm workmen into the various armies, and, in the case of France, Belgium, and Poland, as a result of continuous warfare on the very ground where the new crop would normally be planted. The Balkan States in 1913, despite continuance of their savage war well into the crop season, produced unexpectedly large harvests; yet the decrease from the previous year in the yield of Bulgaria, Servia, and Greece was something like 20 per cent., while neighboring countries which were not at war showed little change.

On the basis of final estimates on the great wheat yield of 1914, there is likely to be only 82,000,000 bushels left from our own crop for the balance of the season—which is a very small reserve. Australia's crop is short; she will have to import about 8,000,000 bushels, against exports of 68,000,000 last season. Canada will be cleaned out of wheat, in all probability, at the end of this present season.

So that this is the interesting situation which appears to be ahead of us. If this country's wheat crop of 1915 were to turn out one of only moderate dimensions, the world might have to pass through a season of excessively high prices for grain. And even if our harvest—after a December condition estimate which is, after all, far better than that which preceded the then very large wheat yield of 1912—should once more be abundant, we should in all probability repeat the remarkable achievements of this year's American grain trade. For Europe will certainly need all the wheat that the United States will have to spare.

BRITAIN'S CASE AGAINST GERMANY
By RAMSAY MUIR
Professor of History, University of Manchester
$1.00 Net
The book is a short, clear, and popular exposition of:—(1) The events which led up to the war, and the way in which Germany has conducted the war. (2) The noxious and dangerous political theories by which Germany has been hypnotized; these are not only analyzed but answered. (3) The History of Modern Germany, showing how these ideas and policies came to win their ascendancy (4) The German constitution. (5) The threatening and aggressive policy by which Germany has aimed at world-wide dominion during the last twenty-five years. (6) The steps which have been taken towards diminishing war by all the civilized nations except Germany, which has consistently opposed these attempts.

THE BOOK OF THE YEAR

CALIFORNIA, ROMANTIC AND BEAUTIFUL

By GEORGE WHARTON JAMES

"Apart from Baedeker, there is no book which gives so much useful information on California for travelers, as the first one on our list—CALIFORNIA, ROMANTIC AND BEAUTIFUL. Romance and beauty form the special subject of Mr. James' volume, the abundant and excellent illustrations in which (some in color), combined with the persuasive text, make it a potent tract for the region and an entertaining one."—*The Nation.*

"Then there is California,—California which needs no discovering, but which no man ever can hope really to know as she is! George Wharton James brings as a Christmas gift an exquisitely artistic volume whose text lingers lovingly on the many beauties of that incomparable State. The illustrations and dainty outer garb of the book are worthy of the charm of that land of flowers and snows, beauty and turbulence, which is its theme."—*The Bookman.*

With 64 illustrations from photographs taken on the spot and 8 plates in full color. In a box, net $3.50*; carriage paid,* $3.75.

OTHER IMPORTANT AND WORTH WHILE PUBLICATIONS FOR BOOK LOVERS FROM OUR 1914 LIST

THE SPELL OF JAPAN

By ISABEL ANDERSON
(Mrs. Larz Anderson)

"Mrs. Anderson actually sets Japan before us and we close her book with the conviction that we have gone into the reality of the country itself."—*Boston Post.*

Illustrated, boxed, net $2.50*; carriage paid* $2.70.

THE SPELL OF SPAIN

By KEITH CLARK

"Written with ardor and enthusiasm from a genuine love of Spain and a sympathetic appreciation of her people."—*Chicago News.* *Illustrated, boxed, net* $2.50*; carriage paid,* $2.70.

From Page's List

AMERICAN COMPOSERS

By
RUPERT HUGHES and ARTHUR ELSON

A new, enlarged, and thoroughly revised edition of Mr. Hughes' successful previous book, "Contemporary American Composers," of which the *Boston Transcript* said: "A popular and valuable addition to the literature of music." *Illustrated, boxed, net* $2.50*; carriage paid* $2.70.

BULGARIA AND HER PEOPLE

By PROF. WILL S. MONROE,
Author of "Bohemia and the Cechs," etc.

"The human interest—'human touch,' Richard Burton would say—thrills every paragraph. The style is rich and attractive without being statuesque, vivid without intensity."—*Boston Transcript.* *Fully illustrated from special photographs, boxed, net* $3.00*; carriage paid,* $3.20.

"Kindliness and forethought for others form the keynote of this delightful book for folk of all ages—an ideal holiday story."—*New York Sun.* *Net,* $1.25*; carriage paid,* $1.40.

GLAD NEWS FOR EVERYBODY!!!

A new POLLYANNA! that is, a SECOND GLAD BOOK, will be published about March first, 1915. The title is not definitely selected yet, but is likely to be either POLLYANNA'S RETURN, POLLYANNA'S TEST, THE PROVING OF POLLYANNA, or POLLYANNA GROWS UP. The publishers will welcome suggestions from any POLLYANNA lover or book lover—almost the same thing—giving their preference for any of these titles with their reasons, or their suggestions for other titles.

PUBLISHED BY **THE PAGE COMPANY** 53 BEACON ST. BOSTON

A WEEKLY JOURNAL

[Entered at the New York City Post Office as second-class mail matter.]

The Nation is published and owned by the New York Evening Post Co. OSWALD GARRISON VILLARD, President; JOHN PALMER GAVIT, Sec. and Treas.; EMIL M. SCHOLZ, Business Manager.

Three dollars per year in advance, postpaid, in any part of the United States or Mexico; to Canada $3.50, and to foreign countries comprised in the Postal Union, $4.00.

Address THE NATION, Box 794, New York. Publication Office, 20 Vesey Street.

BARTOLUS on THE CONFLICT of LAWS

Translated into English by JOSEPH HENRY BEALE, A.M., LL.D., Royall Professor of Law in Harvard University.

8vo. *Half cloth.* 87 *pages.* $1.00 *net.*

Bartolus of Sassoferrato, Professor of Civil Law at Perugia in the fourteenth century, is the most imposing figure among the lawyers of the Middle Ages. To him is ascribed the first and standard statement of the doctrines of the Conflict of Laws; and although his work professes to be based on previous authority, his text is the starting point and the cited authority for all subsequent work on the subject for five hundred years. This is the first translation into English of his Commentary on the Code of Justinian.

"At McCLURG'S"

It is of interest and importance to Librarians to know that the books reviewed and advertised in this magazine can be purchased from us at advantageous prices by

Public Libraries Schools, Colleges and Universities

In addition to these books we have an exceptionally large stock of the books of all publishers—a more complete assortment than can be found on the shelves of any other book-store in the entire country. We solicit correspondence from librarians unacquainted with our facilities.

LIBRARY DEPARTMENT

A. C. McCLURG & CO.
CHICAGO

This week's issue of THE NATION comprises 10,085 copies: of this 7,862 go to paid subscribers and 1,110 go to exchanges or are sent out as free copies. The average weekly newsstand sales during the seven months from April to November, 1914, were 663 copies.

In view of the large library and college and family circulation of THE NATION, it is safe to assume that not less than 20,000 people read it each week.

* * * Copies of *The Nation* may be procured in Paris at Brentano's, 37 Avenue de l'Opéra; in London of B. F. Stevens & Brown, 4 Trafalgar Square, Charing Cross.

The Nation

NEW YORK, THURSDAY, DECEMBER 31, 1914.

Summary of the News

The Government of the United States on Monday sent a memorandum to the British Government, through Ambassador Walter Hines Page, relating to the interference with American commerce by British warships. The text of the memorandum, to which we refer elsewhere, has not, as we write, been published, but it is understood that the protest is couched in firm but friendly language.

The bold yet cautious rôle that Italy is playing in European politics was again manifested when, on Christmas Day, she landed bluejackets at the Albanian port of Avlona and took possession of this important place. The position which Italy has taken up is at once strong and dignified. In every action she has taken since the beginning of the war for the proper maintenance of Italian prestige she has made it evident that she is prepared to fight if need be, but at the same time that she is anxious to maintain her neutrality unimpaired if that is possible. Six months ago Italian occupation of Avlona would infallibly have called forth a furious Austrian protest, followed, if the step had not been immediately retraced, by a declaration of hostilities. It will be remembered that the installation as sovereign of Albania of the unfortunate Prince William of Wied, who all undeservedly added in his time to the gayety of nations, was Austria's counter-move to Italian ambitions on the eastern shore of the Straits of Otranto. The war gave to Italy the opportunity to establish her influence in Albania, which Austrian jealousy had denied her, and following the revolution which ended in the ignominious departure of William of Wied, Essad Pasha, her protégé, established himself, as they say in Mexico, as "provisional president" in the region around Durazzo.

It is a revolt against Essad, fostered apparently by the not very intelligent diplomacy of Austria and by Turkish emissaries preaching a holy war, that has led to Italy's present intervention. Her declared purpose, as notified to the Powers by the Italian Foreign Office, is to maintain the independence, integrity, and neutrality of Albania as agreed upon at the Conference of London, which means that Italy will not permit Albania to become involved in the struggle with Austria and Turkey and against Servia and Montenegro. As we write no protest has been received from the Powers, who a short time ago undertook to settle the destinies of the unfortunate Albanian nation, but now are occupied with other matters, and it appears probable that Italy will remain in unmolested occupation of Avlona, if she so chooses, for the duration of the war. At any rate, it is unlikely that a protest, unless of the most formal kind, will be heard from Austria, as any serious attempt to interfere with the liberty of Italian action in Albania at this time would almost certainly result in adding her to the enemies of the Teutonic Alliance. How delicate the position of Italy was regarded as being even two days before the Avlona incident was reflected in the insurance rates quoted at Lloyds, which were thirty guineas per cent. against war between Italy and Austria, Germany and Turkey within one month, and fifty guineas per cent. against war within six months.

It was announced in the Portuguese Chamber of Deputies last week that Germans had again invaded Angola, Portuguese West Africa, and had made another attack on the military post at Naulila.

Figures indicating the small extent of the recent Boer revolt were published by the South African Government last week. According to this statement 4,000 rebels are now in prison, 1,000 have been sent to their homes on parole, and there are still a few roaming about the country. These are, however, without leaders and are surrendering upon the appearance of Union forces.

German "annexation" of Belgium, according to information received in this country last week, has gone beyond the stage of merely imposing arbitrary fines on cities already ruined, and has reached the more formal stage of demanding that foreign representatives accredited to Belgium shall receive the hallmark of Potsdam approval. Representatives of various neutral countries have received notice that the exequaturs crediting them to Belgium will no longer be recognized, but that provisional recognition may be granted, presumably on application to the German authorities. A similar notification has been received by the State Department. As we write, no action has as yet been taken by the United States regarding this latest demonstration of German thoroughness.

An interesting suggestion in connection with the conference of the Kings of Norway, Sweden, and Denmark, at Malmö, to which we drew attention last week, is made in dispatches to the London *Morning Post* reporting a telegram published in several Scandinavian newspapers. It is that one matter discussed at the conference was the feasibility of merchant ships belonging to the three countries being convoyed by war vessels, in which case the presumption would be that belligerent nations would refrain from instituting a search, the convoy being a guarantee that the cargoes were destined for neutral ports. Attention is called to the fact that this expedient was practiced by the Scandinavian countries during the American war of independence.

Recent rumors of a widespread revolutionary conspiracy in the Philippines appear, from a report of Governor-General Harrison to the War Department, published on Monday, to have been grossly exaggerated, and the exaggeration, as we point out elsewhere, is not free from the suspicion of having been prompted by political motives. The Governor-General's report makes it clear that the so-called revolutionary movements have been small and isolated affairs, consisting of gatherings of a few men of the ignorant classes, without firearms, which were easily dispersed by the police. They seem to have been instigated by an enterprising person called Ricarte, who from the safe seclusion of Hongkong has for some years extracted graft from the pockets of the ignorant by conducting a revolutionary propaganda, one of the most lucrative features of which has been the selling of commissions in his "army" at moderate prices, varying from ten cents to five dollars.

Secretary of the Navy Daniels on December 24 sent to the Naval Committees of the Senate and the House a draft of an amendment, which he urged should be incorporated in the Naval Appropriations bill to be enacted during the present session of Congress, providing for the authorization of a naval reserve from among honorably discharged enlisted men of the navy.

The French Chamber of Deputies on December 23 unanimously voted an appropriation of 8,500,000,000 francs to cover expenses, including those caused by the war, for the next six months. The appropriation was also passed in the Senate by a unanimous vote.

An order in council was issued on December 23 prohibiting the transfer of British ships to foreign register unless a license for the purchase is obtained from the British Board of Trade.

Official announcement was made last week that the London Stock Exchange would reopen on January 4. The conduct of business will be subject to various stringent regulations imposed by the Treasury, among which are mentioned the maintenance of the present minimum price lists, and the condition that no member will be permitted to negotiate the purchase or sale of shares dealt in on the American market "at a less price than the English equivalent of the New York closing price on the 30th of July."

The Japanese Diet was dissolved by the Emperor on December 25 on account of the rejection of the Government's measure providing for an increase in the army. The measure was rejected by a majority of sixty-five. An increase in the navy was approved by the House by a majority of seven.

Dispatches from Peking on Thursday of last week contained interesting intelligence of the revival under the Republic of an historic ceremony, fallen into neglect since the expulsion of the Manchu dynasty in 1911. On December 23, conforming to legislation passed by the Chinese Administrative Council nearly a year ago, which prescribed the worship of heaven and of Confucius by the President of China, Yuan Shi-Kai took on himself the function hitherto reserved for the Emperor, and at sunrise appeared before the Altar of Heaven, reviving the worship of heaven at the winter solstice.

The deaths of the week include: Mark Birmingham, Alfred H. Lewis, December 23; John Muir, Prof. Alfred Fournier, December 24; Gen. Sir Thomas Kelly-Kenny, December 25; Bertram Dobell, December 26; Miss Grace Hoadley Dodge, Charles Martin Hall, Archbishop Patrick William Riordan, December 27; Leonard E. Ware, December 28.

The Week

It appears to be beyond doubt that our Government has made pretty strong representations to Great Britain on the subject of vexatious interference with neutral commerce. So far as can be gathered from the Washington dispatches, the Administration is neither making a formal protest nor laying down hard-and-fast positions, but is reciting grievances and asking for a clearer understanding. Our shippers are entitled to know under precisely what risks of detention or seizure they may send forward goods. That there was some uncertainty in the British practice of the right of search, in the first weeks of the war, was perhaps hardly to be avoided. Conditions were intricate. We had a blockade which was not a blockade. We had open seas which were yet closed by mines. We had lists of contraband and conditional contraband which were continually being revised. But the time has certainly come when all these obscurities should be cleared up. Definite rules of procedure the United States may now rightly ask for. About them we wish to know, in the first place, whether they are in full compliance with international law; and, if they are, what steps our exporters must take to observe them. Here is no question of ruffling up to England, or putting this country in a hectoring position; it is simply a question of a vigilant safeguarding of our neutral rights. We make no doubt that our attitude will be judged wholly reasonable and friendly by the British Government.

Blusterers about King Cotton thought in 1861 that England should dispatch frigates to America to enforce shipment; in 1914, Gov. Colquitt tells us, he would "have sent ironclads to England's door" before he would have permitted our cotton to be held for want of transportation. The paltering Administration policy is exposed by a State Executive who would use the army and navy to compel Europe to pay 15 cents for cotton. By a series of half-way measures, the Administration is now trying to save its face, but it cannot fool Gov. Colquitt. Two months ago it induced Great Britain to announce that cotton shipments were not contraband, and more recently France to do the same; but only after both nations had bought all they needed at 6½ cents. It has even induced its commercial attachés to cable that "the greatest trouble about cotton movements is caused by contraband, especially copper, mixed with cotton cargoes." To-day it is pluming itself on the fact that cotton shipments the fortnight before Christmas reached 557,000 bales, as against 513,000 last year. Plainly, Gov. Colquitt has stepped forward just in time to show up the disgraceful record.

Further revelations as to the lengths to which the British censorship has gone in suppressing news to which its public is surely entitled can only intensify the profound disappointment that this sort of thing can go on in an Anglo-Saxon country. We do not, of course, refer to the military news; if the English authorities wish to be as silly in regard to the loss of the Audacious as they are—London weeklies are printing her picture, and everybody knows why—that is their own affair. They are certainly in this case deceiving no one. The discouraging and dangerous thing is the application of the censorship to political news. Thus, our London correspondent reports that the powers that be there have not permitted the English public to know that Japan intervened at Great Britain's request; that China protested against the violation of her neutrality by British and Japanese troops; that the Japanese Diet has protested against England's limiting the field of Japan's war activity, etc., etc. Surely, when the war is over and the facts become known, the Government which has permitted this sort of thing will have a pretty day of reckoning unless the Englishman by that time has fallen into a state of mind in which he prefers being humbugged. But if he retains his old jealous regard for his rights and privileges, he will surely do a vast amount of protesting, if only at the humiliating assumption of his mental instability and untrustworthiness from his Government's point of view, which underlies this astonishing suppression of facts.

The news that the Japanese Diet has rejected the great army budget proposed by the Government will be a disappointment to jingoes everywhere, and especially to our own, and to our newly formed Security League. Had it gone through, they would have shouted at once: "Now you see, Japan is arming, and so we must." As it is, if we should take their advice, our arming would instantly be utilized in Japan as another reason for more ships and more men for them. This is precisely the stupid game which has brought Europe to its present low pass, and the Japanese Diet is entitled to the greatest credit for having called a halt, even if it should prove to be but a temporary halt. This voting of greater credits for army and navy is one of the surest ways to work against peace the world knows; yet it is always represented as a necessary insurance. We sincerely trust that our own Congress will follow the example of the Japanese Diet and resolutely refuse to increase army or navy, at least until the war is over, when our legislators can really see where the world stands. If we go in for a large army and navy budget, the next Japanese Diet may not prove so wise and, as some British newspapers have been saying, it will then be England's duty to arm against us.

Mr. Menken's "Security League" was originally formed, according to its projector, not to join in a wild jingo demand for more guns, ships, and men, but merely to get the facts as to our military status before the public; perhaps, in order to quiet what is called the "prevailing unrest." Last week it was all but stampeded into the usual wholesale demand for enormous outlays by a resolution calling for the expenditure of $100,000,000 at once, to be met by an issue of 3½ per cent. bonds. This was barely defeated by an appeal for inquiry and investigation first. Congress is, however, to hear from the Security League that it should accept at once all the recommendations of the most belligerent generals and of the Navy General Board. The latter's proposals have been so extreme as not once to have been endorsed in full, if we remember rightly, by a single Secretary of the Navy. Why the League should stop at $100,000,000, we cannot see. Are they willing to take the awful responsibility of standing by that figure when by the expenditure of $102,500,000 they can really protect us against invasion? Whether an inquiry is held or not, we venture to prophesy that the League will promptly be lined up with the Navy League in demanding practically unlimited military expenditure. Finances never weigh with those affected by this craze. They know we are spending 72 cents of every dollar on wars, past and present, but they are quite ready to add $3,500,000 more to our tax-burdens, to say nothing of the sinking fund, the upkeep of the armaments purchased, and all the rest; and this in the middle of a war whose outcome ought to spell freedom from such burdens, and not increased pressure upon the laboring classes.

To pass an amendment to the Constitution of the United States, it is necessary to obtain a two-thirds vote in its favor in each of the two houses of Congress, and the approval (by mere majority vote) of the Legis-

latures of three-fourths of the States. Each part of this process of approval is a substantial act, involving the full responsibility of every person sharing in it. No idea could be more dangerous than that the part of Congress in the affair is of no importance. Upon Congress the most essential responsibility rests; a fact which requires no enforcement upon any sober mind, but which, as it happens, is very strongly emphasized by several circumstances. In the first place, the population represented by a majority vote in each of three-fourths of the States may, on account of the extremely unequal size of the States, be not only a minority, but a highly unrepresentative minority, of the people of the country. Secondly, the absence of any assigned time-limit as to the approval by the Legislatures makes it possible for the approval of three-fourths of them to be obtained without there being at any one time any such number of States whose Legislatures favor the proposal. And finally, closely connected with this, there is the circumstance that Legislatures elected without the slightest reference to any such issue may be snapped up for the purpose at a favorable moment, their vote having no real significance as an indication of deliberate public sentiment. In rejecting the Prohibition amendment last week, the House of Representatives fulfilled a Constitutional duty of the first importance.

If Congress is to enact any general legislation, the two remaining items of Secretary Lane's conservation programme—the general leasing bill and the Lane-Ferris public lands water-power bill—assuredly merit attention. Both have passed the House and are being pressed in the Senate by the Administration and the conservationists; both are meeting with some opposition from power companies and Western State's-rights men. It is the intent of the opposition to postpone their passage till the next session, at least. Yet as Secretary Lane points out, "there can be no argument for these measures or against them which was not made before the House Committee or the House itself, and their passage commends them as expressive of a practical policy which the country will find increasingly advantageous." The one makes more available the public minerals. The other repeals the old water-power revocable permit law, by which capital has no guarantee against arbitrary eviction, and makes feasible the development of our potential resources on a new scale—but 5,000,000 of our 150,000,000 kilowatts now being utilized. Committee hearings make it plain that most of the opposition comes from interests that would grab too much; and the reporting of the bills will bring the fight out where public opinion can assist them.

Those high-tariff Pennsylvania manufacturers who have again demanded of President Wilson that he abandon his "theory" and make them all prosperous and rich by means of *their* theory, are certainly among the most robust reasoners of our time. Nothing stops or changes them. Their logic flows on sublimely, disregarding all facts. That conditions are radically different now from the middle of July, when they first called upon the President to quit his fooling and admit that there was no hope of salvation except in protection, does not make the slightest difference to them. The world has since been convulsed by the greatest of wars, but what of that? In July they were in mortal dread of terrible importations of goods from Europe, and these the war has cut low, but does that make them waver? Not a hair's breadth. With heroic tenacity they stick to their one infallible remedy. Raise the tariff, and we shall all instantly flourish like a green bay tree. And they are equally admirable in their pertinacity of gloom. Others are plucking up courage, welcoming signs of better times, pointing to opening mills and men employed again. But none of these things move the Schuylkill Valley philosophers. Let all the world be wrong, they know that they are right. There can be nothing but ruin until the tariff on their manufactures is raised three-tenths of one per cent. And if, meanwhile, Gabriel should blow his horn and the earth fall in a crash, we are sure that these consistent and persistent gentlemen would rise to say: "This would never have happened if the tariff had not been lowered."

No man ever did or ever will win the Presidency by helping to pass State laws which violate the nation's solemn treaty pledges and impose needless, dangerous slights upon the people of a neighboring friendly power.

This, from a long editorial in the St. Louis *Post-Dispatch*, has reference to Gov. Johnson's aspirations. He can best promote his ambition for the Presidency, it says, "by serving public notice upon the new California Legislature that he will veto any bills which may be passed at the next session proposing further to humiliate Japanese residents of California or to abbreviate their limited industrial opportunities in that State." And it gathers together a number of expressions of opinion from California journals which evince a gratifying sense of responsibility in the matter of our relations with the Japanese. How representative of the general tone of the California press these may be, it is difficult to judge, but the St. Louis newspaper regards them as clearly indicating the present unpopularity of anti-Japanese agitation in California. It is the one comforting consideration, when such ebullitions of senseless intolerance occur as have in recent years been witnessed on the Pacific Coast, that these moral diseases are apt to run their course, like physical ones, and to disappear with as little reason as they emerged. If this should prove to be the case in the present instance, it will be ground for national congratulation. Mr. Taft, in his speech a week or two ago on the danger of war for our country, put none too great emphasis on the importance of this matter of treaty-defying race antagonism as the chief source of peril.

Can a Federal Board with such functions as those of the Board of Mediation and Conciliation be held to its original aims? The report of Commissioner Chambers betrays a certain anxiety lest expansion into doubtful fields of peace-making be hard to check. The work of the Board is already extensive. In the past year it has mediated in twenty-eight railway disputes in which strikes were threatened, involving 125,000 employees. In all these cases the issues were of wages, hours of labor, or conditions of employment, and in nearly all were serious and complex. But both employers and employees are coming to refer trivial controversies also to the Board; some implying "the interpretation of schedules and contracts which cover both rates of pay and conditions of service, and in some instances questions of discipline.' There is pressure upon the Board from employees to enforce its awards. But its true work is to lead the opposed parties, by voluntary steps, to agreement. Since the great threatened strike of Eastern trainmen in July, 1913, it has undoubtedly saved the country a large sum; and its dignity and reputation for impartiality are carefully to be safeguarded along the lines of the original Newlands Act.

Constitutional scruples should not be treated lightly, but the report of the General Education Board shows a salutary dissipation of those which long prevented the Government from engaging in the work of Southern farm demonstration. When the Board began its labors in 1906, the Southern farmer was struggling under a handicap of

ignorance which held his average annual earnings in some States below $150. The Department of Agriculture, though combating the boll weevil on experimental farms, refused to undertake practical agricultural education, on the ground that Federal funds could be used only for interstate purposes. The offer of the Board to finance such work under the direction of Federal officers made possible the gradual appropriation of Government money, until last year came the announcement that the Government would fully take over and extend purely educational farm demonstrations. The amounts spent by the nation, the States, and the Board combined totalled $47,000 in 1907; in 1914, $1,000,000. An encouraging fact is the increase in State appropriations, amounting last year to about $500,000. The Western State universities long ago proved the value of farm-demonstration work, and yearly use huge sums in it; there is no reason why the Southern agricultural colleges and State Boards of Agriculture should not carry on a similar endeavor.

The centre of the child-labor problem is not in the factory, but on the farm, at least in North Carolina, according to the professor of rural sociology in the State University. The proportion of children on the farms to those in factories he puts at sixteen to one, yet for the protection of the former there are no laws regulating either the number of hours they may work or the age at which they may begin. On the side of educational and other opportunities, also, they are under a handicap as compared with the boys and girls of the factory towns. Even in the matter of the standard of living they are behind. Yet the term "child labor" suggests long hours indoors, machinery, dust, tenement homes. These are the work of man, but do we not speak of God's out-of-doors? The factory is at least a more or less enterprising form of activity, and we have become accustomed to hearing of dwelling houses and school buildings put up by factory owners, especially in places where the factory is the only reason for the community about it. The farm, on the contrary, supposedly capable of supplying all its own wants, has found it easy to settle down into a rut and get along on as little as possible. Rural sociology will have no trouble in finding a large field for investigation.

Seldom, if ever before, in our history have seventy-four men, ranging from Mayor to gunmen, and including judges, a sheriff, policemen, and other city employees, been indicted in a body. If this had happened in New York under Croker or in Philadelphia under Ashbridge, surprise would have been smothered in satisfaction, but who could have expected it in Terre Haute, Ind., a couple of decades after the "blocks of five" scandal? The charges against Mayor Roberts are many: levying assessments upon proprietors of gambling houses, saloons, and dance halls; hiring men to haul repeaters to the polls; intimidating others in order to force them to enter the alleged conspiracy; directing the making of cards of false registration, and so on. These acts, if they were committed, violated the Federal election law. While there is a certain comprehensiveness in the indictments, in that they include men who call themselves Republicans and Progressives as well as Democrats, yet, in the words of the Indianapolis *News*, "The men under arrest are all members of the Crawford-Fairbanks-Roberts machine, and most of them are habitués of the 'red light' district." That is, the *News* adds, maliciously, "they belong to the governing class in Terre Haute." That newspaper rejoices at the arrests because they deal a blow at an old system: "Precisely such crimes have for years marked Terre Haute elections. The men guilty of them have never felt that there was the slightest danger that punishment would follow. They have gone about the business as though it were a legitimate industry."

No one can have read the obituary notices of the life of John Muir, whose death occurred last Thursday, without being impressed with the feeling that here was one of those grand personalities seldom met with in any generation or in any country. The combination of high intellectual powers with a nobleness, simplicity, and purity of spirit far more rare is what gave his life and work its unique character. Such a life would be an inspiration for all, even if it had accomplished no great public service of a specific nature. But in Muir's case, we have not only his scientific and literary output, but the invaluable and imperishable service he rendered to his country and to the world in giving the chief impulse to the preservation of the marvellous scenery of our national parks. One cannot avoid a pang of keen regret that, in spite of his singular part in this achievement, the voice that he raised in his old age for the saving of one of the most precious bits of the Yosemite region from impairment was raised in vain.

The late Alfred Henry Lewis falls into the category rather of Artemus Ward than of Bret Harte. Unlike the delineator of Poker Flat and Roaring Camp, the author of "Wolfville Days" had little genius for the short story; his tales kept to the simple outlines of the sketch. Perhaps for this reason they bring into clearer relief the elements of humor and picturesqueness of character as the chief literary materials of the early West. His pictures of the personalities of the long-winded Old Cattleman; Doc Peets, "the genteelest sharp, and the best eddicated, that ever dwells in Arizona"; Cherokee Hall, "predestined kyard-sharp"; and the rest of the camp which eats its daily flapjacks at the O. K. Restaurant, and adjourns to the Red Light bar—are rather caricatures than anything else; but they are legitimate and amusing caricatures. The episodes, too, are of a sort harmonizing with the wonderful adequacy and impossible flavor of the Arizona language.

The panoply of war may be ready prepared, but its songs must be impromptu. If a Randall or a Rouget de Lisle does not come forward, a camp-meeting hymn fits out the words of "John Brown's Body"; those who are astonished at the vogue of "Tipperary," as Frenchmen were at "Il fera très chaud dans la ville ce soir" in 1898, must remember that the recruit wants something new—the war-songs of yesteryear won't serve. It needs but a casual review of English songs to demonstrate the fact. "Over the hills and far away. Over the hills and o'er the Main, To Flanders, Portugal and Spain," has all the plaintive sense of distance required, with a history and tune alike respectable—Queen Anne's armies sang it. Geography and sentiment are appealing in the old Somersetshire "High Germany":

O don't you hear the bugles, the route at last has come,
And we must march away at the beating of the drum.
Go dress yourself in all your best, and come along with me,
We're going to the cruel wars in High Germany.

Every regular British regiment knows the air of "The British Grenadier," and the list of martial lyrics by great English poets is not short. It is the tendency of a nation's war songs to grow better as the conflict lengthens; but for initial use it would seem the military authorities might have a few approved but "new" tunes up their sleeves—to save the troops from taking just anything at hand.

MEANER THAN THE MEANEST FILIPINO.

The Filipinos may be a bad lot. They may have no sense of gratitude, no political decency; and may be without fairness or honor in controversy. But we are bound to say that the worst of them shine by comparison with the American public men and the mob of our Republican newspapers that have seized upon the seditious incident at Manila to make a railing attack upon the whole Filipino people. Aha! the cry is, now you see that we were right when we said that they were a set of savages, no more fit to rule themselves than so many Apaches. And as for our ineffably silly President, notice what he has brought about by his idiotic Jones bill promising the Filipinos independence. Precipitated a revolutionary outbreak, that's what he has done. Anyhow, the nonsense has ended now, and we'll hold the islands under stern military rule long after all these incompetent and unpatriotic Democrats are dead.

The infinite meanness of all this is deepened by its cool disregard of the facts. In their rush to defame the Filipinos and score a point against the Administration, these Republican assailants are like a Moro *jurado* running amuck. They simply lower their heads and strike out right and left, not stopping to ask whether they are hitting friend or foe. Their one great assertion is that this petty insurrectionary disturbance, which was put down by the police alone, is the direct result of the pushing of the Jones bill in Congress. Except for that, this man Ricarte, aspiring to be a second Rizal or Aguinaldo, would never have plucked up courage to undertake his machinations. A little thing like the historic fact does not bother them or restrain them in the least. Governor-General Harrison, in reporting the affair, which he describes as trifling, declares that Ricarte has been carrying on his revolutionary propaganda in Hongkong "for several years." It seems, then, that he didn't wait for Jones to give the signal! And if it be said that Governor Harrison is prejudiced, or compelled to do a little official lying, the same cannot be alleged, in this matter, of Dean Worcester. This former Secretary of the Interior in the Philippines, under a Republican Administration, has an interview in the New York *Tribune* which could scarcely have been read by the writer of the ramping editorial about the "Sedition-Coddling Jones Bill" in the same paper.

Dean Worcester quietly explains that it is absurd to attribute any serious importance to the methods or manœuvres of Ricarte. He himself was long ago familiar with them. Ricarte "has tried repeatedly to cause trouble in the country, but never was successful." And Mr. Worcester is emphatic in his opinion that none of Ricarte's dupes or tools can give any real anxiety to the authorities. The whole thing has been for years thoroughly understood, and is regarded in Manila as farcical. Dean Worcester adds, with a great good sense, that all such stories ought to be "scrutinized with special care" at a time when the Jones bill is pending. Turning the argument neatly against the editor of the *Tribune* and his fellow-flagellants, he remarks: "There are Filipinos opposed to the bill who might start them [such stories] to influence public opinion."

It is not necessary to say that this sudden outcry against the Filipinos, upon so flimsy a basis, and against the Philippine policy of the Administration, is political in its motive. The trail of that serpent is conspicuously over it all. To so partisan an attack, no one would object provided it were made in a way not to degrade its authors and lower the country in the eyes of the world. Go ahead, gentlemen, in your mere party assaults upon President Wilson, to your heart's content. Make him out an imbecile. Reduce his policies to pulp. But do give a thought to the effect upon the outside world of all your abuse of the Filipinos, and your apparent willingness to have this country treat them in the roughest spirit of the military conqueror and aggressor. You can't help being partisan, but can't you throw a veil of decency over your partisanship? Your object is to discredit the Administration, but can't you go about it in a way not to discredit the American people, by making it appear that they are ready, with you, to be meaner than the meanest Filipino?

It is not worth while to dwell upon the reasoning of this new outburst against the Filipinos. The Ricarte fiasco is said to prove them incapable of self-government. Even if the affair had been formidable, instead of a fizzle, it would not have proved that. The doings of the Clan-na-Gael were not a demonstration that the Irish were not fit for Home Rule—though there have been many Tory Englishmen, like these Tory Americans of ours, to affirm that they were. Home Rule for Ireland came on nevertheless. But it is the wretched spirit and the grossly ill-timed character of this new denial of the rights of the Filipinos to aspire to possess and govern their own land, which most affront. Here we are at a time when the feelings of the world are peculiarly sensitive on the subject of small nations, and their brutal treatment by larger; when every man of liberal sentiments is hoping and predicting that the end of the war will bring a great change in the attitude of the bigger Powers towards dependent peoples; and this is the juncture chosen by American Imperialists of the baser sort to make a new assertion of their high and mighty intentions regarding the Philippines. That this writes them down for what they are is their own affair, and does not matter. But that they are in the act defiling, so far as they are able, the good name of the United States, is really the disgraceful and repulsive thing. We devoutly hope they will quit it.

"THINKING," GERMAN AND OTHER.

Maximilian Harden, in his Berlin newspaper, the *Zukunft*, has had the courage to tell his countrymen the real reason why the opinion of neutral nations bears so strongly against Germany. It is not, he says, that "they are not told the truth." In admitting this, Harden abandons as hopeless the whole German propaganda abroad, especially in the United States. It was based on the assumption that Americans had been fed upon lies, and that as soon as Germany should be able to get her case before them, they would at once change their mind. This was the theory of campaign of the German professors, of the individuals and the associations in Germany that began to flood the American mail with letters and publications, and of the various Germans who, officially or otherwise, have undertaken the defence of the German cause in this country. That the whole effort has come to nothing is obvious. American opinion remains what it was. Nor was it built upon falsehood. All this mighty attempt to set us right has not produced a single fact, a single document, a single argument which was not known in the United States from the beginning. The trouble was, as Maximilian Harden now states, not that we did not have the truth, but that we were "unable to think as Germans do."

This is both frank and philosophic. It goes near to the root of the difficulty. Something of the same thought was expressed by President Eliot at the New England dinner last week when he said that the ideals of Germany were different from those of the United States. We Americans cannot bring ourselves to think, in all this matter of war, in the terms which are native to the German mind. What happens to an American when he tries to do it, is rather pathetically

shown in a little pamphlet which has just reached us from Munich. It is from the pen of George Stuart Fullerton, well known as a professor of philosophy in Columbia University. He writes as "An American to Americans," and entitles his pamphlet, "Why the German Nation has Gone to War."

Now, will it be believed that in the entire production not a solitary explanation is offered of Germany's reasons for going to war? All that Professor Fullerton has done is to give a sympathetic interpretation of German militarism. He knows and loves the Germans, and seeks to make it clear how it was that a peaceable, scientific, music-loving people should have felt it necessary to arm to the teeth, to become a *Volk in Waffen*. All this is done intelligently and interestingly, but the war itself is described merely as "inevitable." Professor Fullerton says in so many words:

> I make no reference to the neutrality of Belgium, nor do I think it worth while to touch upon the question who first formally declared war on this side or on that. In the light of what the world now knows, these have become wholly *trivial* matters.

But what is all this except a demonstration of the fact that when an American sets himself to thinking about the war as the Germans do, he instantly makes negligible what to the American mind has all along been and to-day continues central and vital?

Far be it from us to set up American thinking as a model of all that is clear and straight. Only, if anybody is going to tackle the job of inducing Americans to think differently about the war, he ought to start out by getting an adequate notion of what they do think, and why they think it. Regarding the causes of the war, and the responsibilities for beginning it, public opinion in this country early came to a very decided verdict, and there is no evidence that it has changed or will change. The great differences of view among Americans, relating to the war, have now to do only with its conduct and with the possibility of bringing it soon to an end. On the latter point there is a great deal of thinking—or, at least, of talk and writing—which falls lamentably short of letting the mind pursue the subject to the end. It is so easy to confuse what we wish with what we have the power to do! Of course, all Americans wish that the war might stop to-morrow. All of them would be proud and happy if there were any way in which the United States could effectively and peacefully intervene to put an end to the frightful loss of life and wrecking of civilization. But the hard facts being as they are, what is the use of raising the cry that our Government ought to "do something"? This is not thought; it is pure emotionalism. Until a man can present a worked-through project, at once feasible and demonstrably efficacious, for protests by neutrals against the continuance of the war, he ought not to urge such a thing. It may show that his heart is full, but it will go far towards proving that his head is empty. The United States Government proffered its good offices from the beginning of the war. The President assured the warring Powers that they might avail themselves of the proffer at any time. Publicly and officially, we can at present do no more. We cannot, that is, unless we desire to get into a position from which we should have to retreat ingloriously, or which would lead us to go to war ourselves.

The alternative is, we do not deny, terrible to contemplate. What it is was shadowed forth last week in the statement of the French Prime Minister to Parliament. It had previously been made plain by the responsible rulers of Great Britain and Russia and Germany. After the appeal has madly been made to brute force, there is nothing for it but to wait till one side or the other is bled white and asks for terms. It is awful to think of this, but thinking of the other sort should have been done before the war. Not in vain did Sir Edward Grey warn the Kaiser that a refusal to seek peace by means of a European Congress would be followed by "immeasurable consequences." What they are, we now see in all their terror. Out of them all, we may yet hope that the wrath of man will turn to the glory of God. Translated into modern thought, this means that the very denial of civilization and humanity may work out into a higher civilization and a purer humanity. If that results, we may yet come to feel of this awful war, as Lowell did of our Civil War, that it was, despite itself, a "great corrector of enormous times."

ECONOMIC THOUGHT AND THE WAR.

Prof. Henry C. Emery contributes to the *Yale Review* for January a most notable article, the title of which, "German Economics and the War," does less than justice to the wide range and the significant character of his discussion of what may be called the intellectual basis of Germany's attitude towards the world, and towards the general problem of war and peace. It is not only German economics—*i. e.*, German economic doctrine—but German views, German habits of thought, in the domain of history and jurisprudence, that he subjects to illuminating comment. He brings out the natural operation of these intellectual causes, in connection with certain fundamental traits of the German character, in creating that state of mind which has played an essential part in paving the way to the stupendous conflict which the world is now witnessing. In the judgment of those who believe that "tout comprendre est tout pardonner," Professor Emery's article will go far towards absolving Germany of her guilt in bringing on the war; while those who consider that maxim false in theory and pernicious in practice will yet recognize the pertinence and the force of the considerations he brings forward.

We shall not attempt to convey any idea of the content of the article as a whole; but there is one passage in it, easy for the wayfaring man to appreciate, to which we should like to draw special attention. "For the historian or economist," says Professor Emery, "one of the most fascinating features of the present struggle is the problem as to how far the war is the result directly of economic conditions and how far it is the result of economic teaching that holds struggle to be a necessary part of economic life. I have at times gone so far as to suggest that the war might properly be called 'the war of the economic interpretation of history.' This means that it has been brought about as much by ideas regarding economic pressure as by any direct economic pressure itself."

As regards the deeper intellectual prepossessions, those that are more distinctly of an abstract or doctrinaire nature, the peculiar traits of the German mind and temper are largely responsible for the hold these have taken upon the people. But in the matter of the influence of "ideas regarding economic pressure," rather than the economic pressure itself, being the cause of national policies and national antagonisms, Germany is just like other nations. In such a country as our own, or as England, quite as much as in any other, it is constantly necessary to fight against delusions of the "manifest destiny" type in the economic field. In the early weeks of the present struggle, at the close of an editorial on the part played by protectionism in fostering the spirit that leads to war, we said:

> Those who talk so glibly about economic causes being at the bottom of all the developments of history would do well to give their attention to the part which, even in the economic field, is played not by the economic causes themselves, but by the ideas which men entertain in regard to those causes. If the South had known that slavery was not

essential to her economic prosperity, there would have been no Civil War; and it is not an overbold supposition that, if the nations of the world had been emancipated from the delusions of protectionism, the passions and prejudices which have had their part in bringing on the unspeakable horrors of the world war of to-day might never have attained the intensity that made such a calamity possible.

What Professor Emery has in mind is something broader and more essential than the question of protection or free trade; but, while German doctrinaires harp on survival, struggle for existence, and so on, the generality of Germans, when they talk about economic pressure, are thinking of matters much more nearly related to their immediate bread and butter. And it is delusions concerning international trade, incomparably more than the actual facts concerning that trade, which are with them, as with other peoples, the source of dangerous jealousies and fears. How prone even men of intellectual power are to such delusions, and how possible it is for them to get a footing even in a nation long habituated to freedom from them, was strikingly shown in Mr. Chamberlain's remarkable revival of protectionism in England a little more than a decade ago.

What is most distinctive in the operation of intellectual dogmas or prepossessions upon Germans is not, however, so much the susceptibility of their minds to the influence of abstract ideas as the unqualified dominance which they permit these ideas to have upon the actual conduct of life. Something like that kind of dominion was ultimately acquired in the South by the abstract doctrines which were gradually built up in justification of slavery; but it would be difficult to name any other instance even distantly approaching it, in any modern people except the German. In their unbending acceptance of the supposed dictates of abstract thought there is something unquestionably admirable; it is of a piece with that German thoroughness which has been an example to all the world, and in so many ways an example of inestimable value.

But there are limits beyond which loyalty to the commands of abstract reasoning becomes disloyalty to instincts deeper and more abiding, and principles more vital to the soul's integrity, than the teachings of any school. Carried far enough, this disloyalty may, on the moral side, become ruthless inhumanity; on the intellectual side it may become sheer madness.

WAR'S REACTION ON LITERATURE.

We are now in the second stage of the literary production caused by the war. The first rush of writers to the colors was inevitably hurried and confused. The poets could not keep their verses even nine days for polishing, much less could they follow the Horatian rule, and the result was necessarily crude. There was much shouting and exhorting and posturing, but very little poetry. Nor were the prose-makers much more successful. In the first weeks of the war there were great efforts to make some large utterance that might measure up somewhere near the tremendous event, and the public was eagerly on the watch for a literary genius who could express something of the might and horror of the conflict, but there was little but disappointment to record. Now, however, the poets and dramatists and masters of prose have had time to get their second wind. How are they at present reacting to the immense suggestions of the war?

No one will pretend that a literary masterpiece has accompanied the roar of the cannon. We still get writing that is more curious than compelling. Some of it is highly interesting. None of it is of the sort that Clough had in mind when he summoned poets to come to make clear to the world the "inner meaning" of its experiences. In default of this, we are left to study, rather, the strange and unexpected ways in which different writers are affected, in their thought and style of composition, by the war. Who could have predicted that it would make Barrie heavy-footed? Yet in his ineffective little war-play, "The Day," he moves with "all the playful grace of a hippopotamus." This is one more horror of war, that under its influence the whimsical, the fantastic, the lightly imaginative Barrie should have become stodgy! On the contrary, we find that Kipling, who might have been counted upon to outdo himself in his own battle-axe, 'Ercles vein, is capable, in story in the *Century*, of a delicately conceived and deftly executed bit of work. Without once mentioning the word Belgium, and paying his readers the compliment of supposing that they will know what he means without a nudge in the ribs, he gives a very penetrating, because very restrained, impression of the pitiful misery of bereft Belgian childhood, as reflected in the consciousness of a kind German woman. Alongside this admirable bit by Kipling may be placed the condensed drama by Leonid Andreyev, translated by Mr. Bernstein and published in the New York *Sun*. Here, too, is literary art which, if war could not stimulate, it could at least not silence.

All such minor and chance exceptions, however, serve but to confirm the general conviction that the reaction of this war upon literature has not been to the latter's benefit. Maurice Hewlett was speaking about the matter in London a few days ago, and sought to work out the principle that good writing cannot, in the nature of the case, be done in time of war—especially such an overpowering and all-engulfing war as the present. He insisted upon the element of calm as essential to the poet's endeavor to reflect life. It is "emotion remembered in tranquillity" that enters into all great poetry. And when every mind is engrossed by a pressing world-disturbance, the brooding leisure and the attitude of soul requisite to high literary production are necessarily wanting. It is not reasonable, therefore, Mr. Hewlett argued, to look for any great poem about the war, or really masterful writing about it, until the war has long been over.

Not even then will it surely come. Prof. Gilbert Murray has girded against the notion that a stirring war makes stirring literature. He has pointed out that there has never been in England a really great poem about the Armada. And the literary expression of the long Napoleonic struggle was nothing, on the whole, for Englishmen to look back upon with pride. They had to wait almost until our own day for Thomas Hardy, in the "Dynasts," to do something like justice to that period of upheaval and striving. Our own Civil War was as far as possible from producing a literary flowering, at the time or later. Turn over the pages of an anthology of American war ballads, and with two or three exceptions, they are a pretty sorry lot, artistically. No, among the fallacies about war, none is more patent than that it directly quickens literary talent. Far in the past, after the graves are grass-grown, it may lend itself to imaginative treatment; but at the moment it bears down too depressingly upon the writers, as upon the rest of us. Mr. Hewlett gave the poets and the dramatists who are tempted to write about the war one good piece of advice. They should not try to do too big a thing. And they should be afraid of their own facility in producing the obvious. What they should seek is simplicity, a quiet sensing of one or another aspect of human suffering, a not too vainglorious rendering of national aspiration, and, above all, a heart sensitive to the subdued wail of women and children, a "faculty of tears."

THE SCHOLAR BOOK-COLLECTOR.

The death in London of Bertram Dobell, book-collector, book-seller, poet, and discoverer of rare manuscripts, recalls the liveliest passage of Dibdin's "Bibliomania." "'I will frankly confess,' rejoined Lysander, 'that I am an ardent bibliomaniac—that I love books dearly—that the very sight, touch, and mere perusal——' 'Hold, my friend,' again exclaimed Philemon, 'you have renounced your profession—you talk of *reading* books—do *bibliomaniacs* ever read books?'" The sneer has lacked justification in the case of others than Dobell, though his is perhaps the brightest instance of the scholar-bibliomaniac. He read five hours a day; he was the patron of the author of "The City of Dreadful Night," who badly needed encouragement; he identified Thomas Traherne's works, and published them in 1906 and 1908, interrupting the labor to bring out the poetry of William Strode; and he contributed to our knowledge of the life of Lamb.

It may once have been true that the bibliophile who read a book was regarded as was the fox-hunter who shot a fox. We hear of men like Sir Thomas Phillips, who bought largely and seldom opened the cases his books came in; and in general he who purchases a Shakespeare for $3,000 because it is rare gets less benefit from its pages than he who invests little with the intention to read. But the death of Dobell is a reminder of what a long line of deeply cultivated book-hunters preceded him. We speak not of those to whom collecting has been an avocation—and among these are queens, popes, financiers like Colbert, writers like Scott and Southey, and warriors like Prince Eugene—but of those to whom it was a vocation or little less.

One of the list, for example, is the mighty book-hunter, Archdeacon Meadow, who went up to London in the last century to be examined by a Parliamentary committee, and returned penniless, followed by a wagon containing 372 copies of rare editions of the Bible; a scholar in that field ripe and full. Another is John Payne Collier, long as well known in London bookshops as was his "History of English Dramatic Poetry." Halliwell-Phillips, of Shakespearean fame, was an inveterate rambler in Bookseliers' Row. We know in our own day the work done by Dowden and by Grosart, the former noted for strokes of luck, the latter as sturdily pedestrian a collector as he was a scholar. But for the great mid-century names in the list we must go to the "Confessions" of W. C. Hazlitt, descendant of the essayist and chief of cataloguers. For years he worked in connection with Richard Heber, who had been largely instrumental in saving the library of George III from sale to the Czar, and whose "Bibliotheca Heberiana," published in thirteen parts, held notes on Dekker, Gascoigne, Mariowe, and others. Huth and the library he filled from a full pocket are made famous by the reprints of that name. Both were scholars and linguists, and the latter, son of a German father and a Spanish mother, studied on a cosmopolitan scale. Locker-Lampson was collector, poet, and investigator in one. Finally, we have Lang's "The Library," and Augustine Birrell's essay lamenting the day that Oxford's sons actually at times walk past a book-stall without stopping "just to see what the fellow has, you know." Book-collecting on some scale, in some limited period, is naturally a *sine qua non* of real research; but these men have covered a catholic field, have acquired duplicates—the sign of departure from book-getting for literary and professional purposes—and have been, in fine, virtuosos.

The tendency to put book-collecting to the fullest possible literary and scholarly use has beyond all doubt grown, stimulated alike by the character of modern scholarship and the character of the book trade. Few pedants like Gissing's "Christopherson," collecting books aimlessly till they crowd the wife from her last room, can longer exist. In the change, commercialism has played a part. The romantic days when book-collecting was done through ignorant intermediaries offering unknown bargains is past; now the merchant himself tries to bring all transactions into the full light of exact knowledge, with resulting impetus to scholarship. Hazlitt and others have placed the blame for high prices on the American invasion; and it is said that one State university is held in just abhorrence throughout Europe for its boosting of prices after a sudden appropriation for library purposes. But there are other reasons for the passing of the time when Hazlitt could buy a box of seventeenth-century pamphlets for £15, and sell them to Huth for £150; when a Paris collector could pick up the Elzevir "Pâtisserie Française" at 6 sous, worth £600; when Thomas Corser could accumulate for £9,000 a library that sold cheap for £20,000. Few of the booksellers who in London offer their wares in the dirty network of streets between the British Museum and the Strand have been men of high attainments; but since T. Green issued the first catalogue in 1729, their average of book-knowledge has risen consistently.

Chronicle of the War

Events during the past week will have been watched with particular interest by military and naval experts in neutral countries. On a larger scale than ever before, the effectiveness of new weapons of warfare has been put to the test. On both sides has been displayed considerable activity in the air, and if the results are still somewhat inconclusive, they are at least extremely interesting. The Germans started with a raid by an aeroplane over Dover on December 24. A bomb was dropped into a garden, where it exploded harmlessly, and the aviator thereupon disappeared in the fog. On the following day German aviators flew over the Thames at Gravesend and Southend-on-Sea. British aviators gave chase, and there ensued a battle in the air, which finally resulted in the disappearance of the Germans without any damage being done on either side. Air-defence guns were also fired at the hostile aeroplanes, but without effect. From spasmodic raids of this description it would appear that no new lesson is to be learned. They have merely demonstrated what was already taken for granted, that various points of England are exposed to attack by hostile aeroplanes or Zeppelins, and that some damage may easily be done by a lucky shot. Further than that they have only shown that England has an efficient defence organized to meet such attacks.

The joint sea and air raid undertaken by England on Christmas Day on the German naval base at Cuxhaven, at the mouth of the Elbe, was an event of far more significance, as being the first occasion on which sea-planes and warships have coöperated in a concerted movement, and the first on which a battle has been fought simultaneously in the air, on the sea, and under the sea, with vessels of war, aeroplanes, Zeppelins, and submarines all engaged. According to the Berlin account, the British squadron consisted of six vessels, two of which are said to have been the light cruisers Arethusa and Undaunted, and the remaining four destroyers. Accompanying the squadron were seven sea-planes. The attack was undertaken by daylight, starting, according to the official British account, "from a point in the vicinity of Heligoland," and its principal object was the enemy's warships lying in Schilling Roads, off Cuxhaven. Whether any damage was done by the attack of the British sea-planes, or what was the extent of it, cannot be determined. The attack was hampered by fog, and the German account denies that any damage was done, while unofficial reports from British sources incline to the natural belief that the attack was not ineffective.

Even, however, if we grant that the raid was spectacular rather than immediately profitable in the destruction of warships or fortifications of the enemy, it must be conceded to have been valuable on account of its moral effect both in England and in Germany. Warning was sent from Heligoland of the approach of the British squadron, and it was immediately attacked by Zeppelins, sea-planes, and submarines. These attacks were successfully resisted for three hours; three of the planes, with their pilots, were picked up by the cruisers; three were abandoned, but

their pilots were saved by submarines; one aviator was supposed to have been lost, but it has since been reported that he is a prisoner of war. Finally, the squadron escaped without serious damage, although bombs fell all around the British vessels. Doubtless fog played an important part in protecting the ships from attack from the air, as it did in nullifying the efforts of the British airmen, but even making full allowance for this factor, the complete failure of the Zeppelins is significant. The two Zeppelins, says the British official account, "were easily put to flight by the guns of the Undaunted and the Arethusa," and it is stated unofficially that one of them was badly hit by the high-angle fire of the cruisers.

For some time the relative inactivity of the Zeppelin fleet has given grounds for the suspicion that these much-vaunted monsters of the air have proved in practice to be of little use for offensive work, while for purposes of scouting the aeroplane has been shown to be more effective. The failure of the Zeppelins at Cuxhaven seems to lend ample confirmation to this suspicion. Henceforward nervous Britons may be expected to sleep more soundly in their beds, relieved of the dread of the unknown, while, conversely, in Germany there will be considerable chagrin over the disappointing results of what was to have been one of the surprises of the war. More important still for students of naval matters is the success with which the British ships eluded the attacks of submarines. The exploits of the German *Unterseeboote* have inspired a wholesome respect for these vessels, and the progress of the naval warfare heretofore has tended rather to confirm the opinions of those who have contended that the day of the battleship is over. The action off Cuxhaven reveals the fact that submarine attacks may be baffled by clever seamanship. The British destroyers, apparently, adopted the recognized tactics against submarines, manœuvring at high speed round the cruisers, and repelling all attempts to torpedo them.

The raid, though unproductive of material results, gives a sufficient answer to home critics of the British navy, who have expressed surprise at its lack of enterprise, and were excited by the German raid on the east coast. Both in the English and in the American press there seems to have been a good deal of misunderstanding of the North Sea and the blockade which the British navy maintains there. The German navy is spoken of as being "bottled up" in the mouth of the Elbe, and a general impression seems to prevail that at some point across that estuary is drawn up a line of British ships, prow touching stern, through which it would be impossible for a hostile vessel to make its way. It need hardly be pointed out that the only purpose of such an arrangement would be to serve as an admirable mark for German torpedoes. It is not, of course, the Bight of Heligoland that is blockaded, but the North Sea, which comprises an area of some 190,000 square miles, and the blockade is maintained along the English and Scottish coasts and thence across to the coast of Norway by a patrol of British cruisers and destroyers, the capital ships being held in readiness for action in home waters. There is nothing surprising, therefore, in the fact that German vessels, handled with skill and daring, and taking advantage of fog, should be successful now and then in eluding this blockade of some 800 miles. The exploit of the British squadron which penetrated the mouth of the Elbe, a line of some 200 miles, running the gantlet of the mine-field which protects it, is of the two a good deal the more remarkable feat.

In France and Flanders the siege warfare of the trenches has continued uninterruptedly, with only small gains and losses on either side. To the east of Nieuport the Allies have made a gain of nearly two miles by winning the village of St. Georges, at which they have been pounding for some weeks. Southeast of Ypres, however, at Hollebeke, trenches have been lost to the Germans which give them a strategic advantage in securing their command of the crossing of the Lys River. In the neighborhood of Verdun, at Apremont, positions seem to have been regained by the Allies which the Germans won from them as long ago as the first week in November, and in Alsace an Allied gain is shown in the fact that Steinbach is reported to be closely invested. In the Argonne, also, slight French gains have been reported.

More interesting have been events in the East, where, in Galicia, another of those reversals of form for which the Austrian armies have become famous seems to have been responsible for a substantial Russian victory. Russian official reports on Monday spoke of the siege of Cracow having been raised, as though the withdrawal of the Russian troops from in front of that place had only just occurred. As a matter of fact, as we pointed out last week, the pressure on Cracow must have been relaxed (to speak of the place being "relieved" is misleading, as it has never been really invested) when the Austro-German drive across the Carpathians was successful in penetrating to Krosno and Jaslo, and the Austrians won their victory at Limanovo. Following that success, the German plan appears to have been to divide the Russian forces by an advance from Tymbark, thirty-five miles southeast of Cracow, in the direction of Tarnow, where the force thus advancing was to join hands with an army under Gen. Boehm-Ermolli, coming from the Carpathians along the railway from Sanok and Lisko. Austrian execution, however, appears to have lagged behind, or rather to have anticipated, German strategy, for the Russians received warning of the contemplated move by the premature appearance of Gen. Boehm-Ermolli to the south of Przemysl. Falling back to the line of the Biala River, fifty miles east of Cracow, the Russians concentrated their forces and delivered a slashing attack on this army at Tuchow, occupying a wedge of territory twenty miles broad between the forces of Gen. Boehm-Ermolli and those which were coming up from Tymbark. The result seems to have been to compel the former to retreat southward towards the Carpathians, and the latter westward, and the Russians, it may be presumed, are again threatening Cracow. Whether the new Russian advance will accomplish more than its predecessors have done will now depend to a large extent on the resistance maintained to Gen. von Hindenburg's attacks along the Bzura River, and to the German offensive which has been undertaken against the Russian forces on the East Prussian and Mlawa front.

DIFFICULTIES OF NEUTRAL NATIONS—SWISS SENTIMENT ON THE WAR—IMPARTIAL SERVICES TO BELLIGERENTS.

GENEVA, December 7.

European nations which are not at war have to pay a high price for their neutrality. While they have not sent men into the field to be killed in battle or to fill the hospitals and the military prisons, they have suffered and are suffering much from economic and social disturbances.

For Switzerland, since the army is mobilized at its war strength of 500,000 men, the most serious side of the war is the threatened difficulty of obtaining provisions for the civilian as well as for the soldier. Economically, Switzerland is an island. Ordinarily, it gets most of its meat, grain, clothing, and other necessaries of life from abroad. The supply of meat from Austria-Hungary, France, and Italy has altogether ceased. The two last countries still furnish plenty of fruit and vegetables. Germany sends sugar and other groceries. Of milk and butter there is no lack, and the prices of these are normal. Fresh eggs are scarce. The quality of the bread has greatly deteriorated. This is owing chiefly to the policy of England and of France, which have often stopped grain ships en route for Genoa with cargoes consigned to Switzerland; it is owing also to the blockade of the North Sea, which has prevented shipments via neutral ports for the Swiss.

The Federal Government has done, and is doing, its utmost to keep prices within reasonable limits, but fears are expressed that life may become very difficult here before the time of the next harvest. The local authorities have for the present made ample provisions of coal and of potatoes, which are sold retail at cost. The sound of the automobile is seldom heard in the streets or on the highways. No petroleum is to be had anywhere. Fortunately, the price of gas and of electricity has not risen.

The question of Swiss neutrality seems, for the time being, to be settled. It must be admitted that there is only political neutrality, and not neutrality of sympathy. It is natural that the German Swiss, owing to their relations of language, race, and customs, should feel no hostility to the empire on the north. Moreover, of late years, the Germans have absorbed much of the industry and commerce of the nation, so that the withdrawal of their activity has seriously affected business in the German cantons. In like manner, French Switzerland has given all its sympathies to the Allies, especially at Geneva, where the resident French population is very large. But among the more intelligent people there is no great tendency to pass beyond the limits of a platonic sentiment. They say that they are first of all Swiss, and only secondarily sympathizers with either of the belligerents. At the beginning of the war Professor Godet, of Neuchâtel, the leading writer of *la Suisse romande*, in an excellent article, formulated for his countrymen the kind of opinion which should guide them. They might be partisans in sentiment, he said, but should be physically and politically neutral. When a few stray German shells fell on Swiss territory and damaged cavalry barracks near Basel, the people took the mat-

BUR[illegible]AL PUBLIC LIB.

ter complacently, and the Imperial Government sent a prompt apology. When the English airmen flew over Swiss territory in order to drop bombs on the Zeppelin hangars at Friedrichshafen, the Federal Council made a vigorous protest, and the replies from Bordeaux and London were satisfying. The old Roman principle was recognized, "Cujus est solum, ejus est usque ad cœlum."

The press reflects the sentiment of the people in the French and German cantons, respectively. One widely read daily of Geneva is edited by a Frenchman, and there are German writers on the staffs of leading papers at Berne, Zürich, and Basel. On the whole, reports of the war are impartially given: the dispatches of Wolff are printed side by side with those of Havas, Stefani, and Westnik. The Berlin as well as the Paris papers have a large circulation even at Geneva, where there are so many French residents. The English journals arrive here about a week late, but there is little demand for them, as their news is very one-sided, and is distrusted. American papers are not to be had at all. Next to the Swiss, the Italian press, especially that of Milan, is the most popular. Within half an hour after the arrival of the Simplon express in the evening it is difficult to get an Italian paper except at the cafés, although large quantities arrive here from Milan. The *Corriere della Sera* and the *Secolo* are read more extensively than the French papers. The Swiss Government exercises a mild censorship. Some of the less important publications are far from being neutral. A somewhat ribald comic sheet was suppressed because it ridiculed the Kaiser and the German army. The publication of a French paper which defended the cause of Germany was forbidden; and when it reappeared under another name it was ordered to add to its title "Organ of the German Colony at Geneva." Of two illustrated dailies which have appeared here since the beginning of the war, one was directed to discontinue the publication of anti-German poems.

Even university professors have been accused of utterances violating the neutrality of the Swiss. A professor at Berne, a German by birth, publicly announced that Russian candidates for a degree need not present themselves in his department, but the university authorities caused him to change his attitude. Some excitement arose at the University of Geneva, owing to a lecture delivered there by Hugo Claparède, professor of public law. Claparède told his class that the action of the Belgian civilians in firing on the German soldiers was a violation of international law and was justly subject to reprisals. The Claparèdes are an old Geneva family. One of them is a leading authority in psychology; another is well known for his services to geographical science. Prof. Hugo Claparède's remarks provoked an angry protest on the part of his students, who sent a petition to the rector, demanding the professor's resignation, whereupon the Conseil d'Etat suspended Claparède from exercising his functions until the end of the war.

Not only is Switzerland put to great expense directly because of the present conflict; it has also assumed the burdens of other nations. The invasion of Belgium produced a peculiarly deep impression here. It was felt that Germany might easily have attempted to use Swiss instead of Belgian territory, in its invasion of France. In addition to this, there was the natural sympathy of one small nation for another. Accordingly large supplies of money, clothing, and food have been contributed to the refugees of the ruined kingdom, even small Swiss villages whose inhabitants are looking forward with apprehension to the long winter, and to the still longer war, have had their subscription lists, lotteries, fairs, and concerts to help Belgium. Geneva and Lausanne particularly have been conspicuous for their offers of assistance, for their open-handed hospitality. The Red Cross has shown surprising and efficient activity. Professors of surgery have given their services to both French and German military hospitals, and many women have volunteered as nurses. The resources of the nation are, of course, heavily taxed, not only in the maintenance of the army, but also in providing for the families of the soldiers. Moreover, for weeks past there has been a continuous coming and going of Germans and French—mostly women and children—seeking repatriation. Almost all of these are destitute and exhausted. Every day brings hundreds of these poor people, through the principal Swiss towns, on their way to their native place. They stop over for the night at towns like Geneva, Lausanne, Neuchâtel, Zürich, and Basel, where they are lodged, fed, and sometimes clothed by the Swiss Red Cross and other relief agencies. Prisoners of the medical corps of the contending armies pass through Switzerland on their way to rejoin their regiments, which they are permitted to do by virtue of the Geneva convention. Some of them are ragged and wounded. They are accompanied by Swiss guards, are received by Swiss officers, and are fed at the public expense.

Perhaps the most signal service rendered by Switzerland has been the establishment at Geneva of a kind of clearing house, which handles the correspondence between prisoners of war and their families. The Musée Rath here was given as headquarters for this important work. A large committee, made up of women, university professors, and men in various other occupations, has the correspondence in hand, and is now receiving every day thousands of letters to and from French and German prisoners of war and their families. These are either forwarded to their destinations or answered directly by the committee without any charge for postage. Parcels and money orders are also transmitted through the central post office at Berne.

Up to the present time, the neutrality of Italy has been favorable to the conditions of life in Switzerland. Probably the relations between the two countries have never been so friendly. Switzerland has been of service to its southern neighbor in caring for Italians living here who have suffered from the economic effects of the war; and Italy is doing its utmost to facilitate commerce between the two peoples. Complaints have been made by England and France that Switzerland was receiving from Italy supplies which were reshipped to Germany and Austria. The complaint has aroused some ill-feeling here, where every effort has been made to preserve a perfectly correct attitude towards the belligerent nations. Such an accusation seems, indeed, very singular to any one who knows the conditions. The Swiss regulations regarding exports are very severe, and are rigidly enforced. As for supplies, Switzerland cannot afford to export them. It needs them all for itself.

A. A.

Benjamin Disraeli

PERSONAL NOTES ON THE GREAT PARLIAMENTARIAN.

By SIR HENRY LUCY.

My opportunity of studying Disraeli at close quarters dates eighteen years later than the period of his history reached in the third volume of his Life just issued from the press. In 1872 I entered the Press Gallery of the House of Commons as summary writer for the morning edition of the old *Pall Mall Gazette* under the editorship of Frederick Greenwood. Thereafter, till four years later he walked out of the House for the last time, I saw him daily through successive sessions. Acquaintance was renewed when he went to the House of Lords; but not under equally interesting circumstances.

Between 1868 and the close of the session of 1873 Disraeli was Leader of the Opposition, faced on the other side of the table by Gladstone, whose animated oratory he genially touched upon, publicly thanking God that between him and the right honorable gentleman there interposed "a substantial piece of furniture." He was still handicapped by the distrust and personal dislike with which at the outset of his career he was regarded by blue-blooded Tories. They accepted his services because there was none other capable of rendering services of equal value. But they would gladly have got rid of him, setting up in his place one of their own caste and cult.

In 1873 he sorely tried the faith and patience of his followers. By a cabal among his own party hostile to a minor Government bill, Gladstone was placed in a small minority and resigned the Premiership. To the angry resentment of disappointed place-hunters, Disraeli declined to undertake the conduct of the Government in the existing House of Commons. Pressure was put upon him to induce him to alter the determination. He stood firm, and in an eloquent passage, spoken in a voice rarely broken, defended himself from attacks made from the rear and on his flank.

"Sir," he said, unconsciously echoing a well-known passage in Peel's speech when driven from power by coalition among Protectionists, Radicals, and Irish members, "when the time arrives, and when the great Constitutional party enters upon a career which must be noble, and which I hope and believe will be triumphant, they may perhaps remember, I trust not with unkindness, that I prevented one obstacle from being placed in their way; that I, as the trustee of their honor and interests, declined to form a weak and discredited Administration." His prescience was vindicated by the results of the general election which took place in the following year, landing his party and himself at the head of affairs with a majority that for the first time in his political life endowed him with untrammelled power.

On one other occasion only have I seen

temporarily fall the mask his countenance habitually wore, earning for him the cognomen of "the Sphinx." It happened at the funeral of his wife, who died at Hughendon in December, 1872. Self-possession and immobility of visage had served his purpose at many crises of his marvellous career. Both broke down as he stood by the grave of the woman who had devoted to his service the greater part of her life and the full measure of her worldly wealth. Had an artist desired to produce a representative face of Woe, he might have sketched Disraeli's and presented it without addition of fancy touch. Regardless of heavy rain, he walked bareheaded from the Manor House to the church and stood for full ten minutes in the sodden grass by the open vault, the December wind playing with his suspiciously dark hair. While the coffin was being lowered into the vault he never took his eyes off it, regarding it with steadfast, pitiful, almost hungry look, as if he grudged the grave its custody. When it reached the bottom of the vault he seemed to fall into a sort of trance. It was only after his faithful secretary, Monty Corry, afterwards Lord Rowton, nudged him twice that he awoke with a start and took in hand the wreath he was to drop on the coffin lid. To one accustomed to his manner in public life this was a revelation of an unsuspected man.

Disraeli's advent to the Premiership after the general election of 1874 transmogrified the House of Commons. The assembly dispersed by the dissolution was built over a seething volcano. Crises more or less serious were of weekly occurrence. At the incoming of Disraeli the scene changed as by magic. With instinctive dramatic art he assumed an attitude and manner in marked contrast with the feverish haste of his predecessor. Silent, impassive, almost sombre in mood, he remained through a sitting, rarely interposing save in response to questions personally addressed to him.

In these days the measure of attendance Ministers spare for the Treasury Bench in the House of Commons would have shocked Disraeli. The modern custom is for the whole body, save one concerned for the business immediately before the House, to disappear as soon as questions are over, retiring to their snug private rooms, hurrying back only to vote at signal of the division bell. Disraeli not only sat through a debate, however comparatively unimportant, but expected his colleagues to keep him company. Shortly after the Speaker took the chair he arrived and dropped into his accustomed seat opposite the brass-bound box, where, with brief interval for dinner, he remained till the lobby echoed the cry of the doorkeeper, "Who goes home?"

Ever as he took his seat there was precisely the same minute disposition of his person and his apparel. Having draped the tails of his frock coat over his crossed leg, he folded his arms, bent his head, and hour after hour sat immobile. If any thought he slept, they were mightily mistaken. His eyes, bright to the last, furtively surveyed the enemy's camp, always returning to the bench opposite, if Gladstone happened to be in his place. He habitually dined in the House, wherein he again differed from the custom of modern Prime Ministers, notably Mr. Balfour and Mr. Asquith.

Unlike Gladstone, he rarely entered into conversation with colleagues seated near him, an exception being made in the case of Lord Barrington, Vice-Chamberlain of the Queen's Household. Occasionally, towards the close of dull sittings, when Barrington gayly chatted to him, the grim visage would be literally distorted by a smile. Like Chamberlain, Disraeli wore a single eyeglass, differing in respect that, while the former favored a rimless monocle, the latter had his glass slung on a long black cord. One night I observed him in a state of unusual perturbation. He had dropped his eyeglass, and no excursions in the neighborhood of his waistcoat and shirt-front were successful in retrieving it. Barrington found it hanging down his back, and made his chief instantly happy by its restoration. Before he died, Disraeli elevated his old Treasury Bench crony from the position of an Irish Lord to a peerage of the United Kingdom. Peevish persons asked what he had done to merit this high reward. I remembered the successful search for the errant eyeglass.

Early promise of aptitude for the position of leader of the House of Commons was fulfilled throughout Disraeli's first session. At no period of his career did he rise to higher level as a parliamentary speaker, while old members, recalling Palmerston in his prime, agreed that he was not excelled in the special quality of managing the House. Not in the zenith of his popularity after the election of 1868 did Gladstone approach his ancient foeman in the matter of personal hold over the assembly. The last two sessions he lost it with pitiful effect, as in the matter of Radical revolt that threw out the Irish University bill. Disraeli's studiously slow rising from the Treasury Bench in the course of debate and the deliberate opening of his speech signalled instant filling up of the benches, and that steady settling down to attitude of attention which is the highest compliment that may be paid to a speaker.

A marked difference between the bearing of Disraeli and his predecessor was shown during the intervals of debate occasioned by divisions. Gladstone, going forth with the crowd to record his vote, usually carried with him a sheet of note paper and a blotting-pad with intent to utilize the ten minutes or quarter-hour occupied by the division in getting forward with his correspondence. Failing that, he strode through the lobby with his nobly shaped head in the clouds, recognizing no one, an unconscious habit that more than once to my knowledge had the effect of estranging valuable supporters.

When the division bell rang Disraeli also made off to the lobby in the first flight of members. But his purpose was other than the prosaic one of writing letters. During the winter months there was set in the lobby a particular fire, before which he stood apparently intent on nothing more important than comfortably warming himself. But his keen eye was bent on the passing throng of his supporters. Lord Rowton once told me that before leaving Downing Street to go down to the House the Premier possessed himself of the half sheet of note paper on which the faithful secretary had jotted down the names of one or two men with whom for varied reasons a few minutes' friendly conversation was desirable. As one passed, Disraeli signalled him with friendly nod, and when it was time to move on to the wicket, this harmless, apparently accidental chat had unravelled a coil which, left unnoticed, might have critically hampered the machinery of the Government.

The course of public events never brought into nearer or more striking juxtaposition two men so absolutely opposed to each other as Gladstone and Disraeli. One was intense, earnest, thorough; the other indifferent, polite, superficial. When Chancellor of the Exchequer, Gladstone would as readily have made a joke as add a penny to the income tax. Disraeli, with equally light heart, did either as chance befell. It is not an insignificant thing that, while one frequently heard pronounced the opinion that Gladstone had made a great speech, the adjective was never used in commentary on Disraeli. His speeches were spoken of as clever, as distinguished from being great. In a general way, the adjective may be adopted as describing the leading characteristics of the two statesmen. One was great with the full force of lofty moral character and supreme intellect; the other was clever, great only in the sense that his cleverness was superlative.

Disraeli's success as a parliamentary speaker was varied. At his best, presented in the shorter speeches, he was incomparable. As a phrase-maker who could with a combination of two or three words label, to some extent lame, an adversary for life, he had no equal. His passion, rarely indulged in, always seemed feigned, its effect being funny rather than tragic. But his polished shafts of sarcasm, his feathered darts of wit, his dainty gilded bullets of irony, flew about the House and never missed their mark. This gift he retained to the last. Circumstances being increasingly prosperous, his manner became more benign.

Of all his conquests over former enemies none was more unexpected and complete than that obtained over Queen Victoria. The Prince Consort shared in extreme degree the prejudice existing among British gentlemen of mid-nineteenth century against one whom they regarded as a Jew adventurer. The Queen, who devotedly shared all her husband's likes and dislikes, fought hard against Lord Derby's proposal to include Disraeli in his first Administration. A quarter of a century later Disraeli, in conversation with a friend, disclosed the secret of his ascendency in royal favor. "When talking with the Queen," he said, "I observe

a simple rule of conduct: I never deny; I never contradict; I sometimes forget." The inevitable contrast with his great rival came in when he added: "Gladstone speaks to the Queen as if she were a public department. I treat her with the knowledge that she is a woman."

On August 12, 1876, the House of Commons was not a lively place to look upon. It was the last working day of a session prolonged and exhaustive. The Appropriation bill stood for third reading, and Sir William Harcourt did not shirk the opportunity provided by the occasion to attack the Government on its foreign policy. Defending it, Disraeli finished up with some bristling words calculated to call forth a cheer from good Conservatives. "Our duty at this critical moment," he said, puffing out his cheeks and beating the air with his hands, "is to maintain the Empire of England. Nor will we ever agree to any step that may obtain for a moment comparative and false prosperity that hazards the existence of the Empire." These were the last words spoken in the House of Commons by Benjamin Disraeli.

It was nearly eleven o'clock when he resumed his seat. There remained only some formal business to be accomplished in preparation for the ceremony of prorogation. Amid the buzz of conversation, Disraeli rose and strolled towards the bar. I wondered as I watched him. His custom, common to all Ministers, was to seek egress by the door behind the Speaker's chair. Now he slowly paced the length of the floor between the two political camps. Turning when he reached the bar, he made low obeisance to the Speaker. He stood for a moment gazing round the house, and, turning again, walked out through the glass door. With the exception of one or two Cabinet colleagues, no one looking on knew that a momentous episode in the annals of the House of Commons was closed. The morning newspapers betrayed the secret. Disraeli was no more—in his place only the Earl of Beaconsfield.

Book Notes and Byways

A LIBERATOR OF SOUTH AMERICA.

The "biography and iconography"—a certain number of official and unpublished papers and a bibliography—of "Francisco de Miranda," form the contents of a volume of nearly 200 octavo pages, compiled by Count O'Kelly de Galway (Paris: Champion). A cenotaph erected in the National Pantheon of Venezuela in 1895, at the right of the monument of the Liberator, Bolivar, thus sums up the hero's career:

Born at Caracas 9 June 1756; died in the prison of the Arsenal de la Carraca (Spain) 11 July 1816.—A Precursor of the Independence of South America, he travelled in North America, Asia, Europe, and Africa, for the propagation of his ideas. To secure the favor of others for his projects and gather elements that might help to free his country, he fought intrepidly for the liberty of strangers.—He took part in the three great political movements of his time: the Independence of the United States of North America; the French Revolution; and the Independence of South America.

The story of Miranda is recounted at length, in its proper setting of time and place, in the volume published in 1812 by the lamented Jules Mancini on "Bolivar and the Emancination of the Spanish Colonies." This work of original research, the completest yet published, reaches only to 1815, and it is to be feared that no one will be found to utilize the materials which the author was gathering at the moment of his death for a concluding volume. The present book of fragmentary documents, mainly French and with many gaps and little order, has its own use in the greatly neglected but ever profitable study of South American history.

So far as these documents concern the part played in French Revolutionary armies by Miranda—he was a general with Dumouriez, and his name is inscribed on the Arc de Triomphe—they offer little that is new. But, as in all contemporary documents, there are by the way enlightening suggestions for the inner history of the time. It is even of sentimental interest at present that Miranda should have fought the Austrians in the region of the Aisne, where France is again defending her existence, and that he should have taken Antwerp from Austrians on the 26th of November, 1792. With the political turn-about of Dumouriez, Miranda fell under suspicion, and barely escaped with his head from the revolutionary jury. We have here (page 176) a police spy report of what Mère Duchêne—Dickens's La Vengeance—thought of him. Marat, Danton, and Robespierre thoroughly distrusted him as a "moderate"; in fact, his ideas of liberty and the Republic were rather those of North America. He was set free after the Terror in 1795, having been imprisoned two years, a part of the time with the less fortunate Madame Roland. The Directory found him troublesome, and ordered him to be deported to Cayenne. He escaped to England, where, with Pitt and the young United States, he kept up negotiations for securing the independence of South America from Spain. This, through all his dubious, tempest-tossed life, was his one aim; and, though he died after four years in a Spanish prison, posterity has recognized him as, at least, the "Precursor" of the "Liberator."

It was in 1783 that he threw up his commission in the King's army at Havana, and came to the United States, where, he says, Washington and Hamilton promised him troops if England would furnish ships for an expedition. This date, before peace was yet solid with the mother country, seems suspicious; and it would be curious to know if any testimony remains of this early attempt to draw South America into our wake. The Spanish accused Miranda of having betrayed to the English Governor of Jamaica the expedition which they were on the point of making with the French during our war of independence. He himself accused Lafayette of setting spies on him in the United States (page 107). At any rate, Miranda only passed through London, in July, 1784, on his way to interest Catherine II of Russia in his projects. In 1787 he was back with Pitt, who put him off for a better day. He drifted to France and into the army of the Revolution, as we have seen. When he next presented himself to Pitt, in 1796, he received shelter but was forbidden to leave for the United States. He went back and forth to France in spite of all, until Fouché for Napoleon finally expelled him in 1803; and in 1806 he at last reached New York, pretending to have secret aid from England. Through a Mr. Ogden and Colonel Smith (of South Carolina), he got the ship Leander, 30 cannon, 200 volunteers, some of whom were French, and rifles, and sailed for Trinidad, where the English Admiral Cochrane reinforced him with fifteen ships. The expedition disembarked at La Vela de Coro—and was speedily forced by the Spanish troops to reëmbark.

In 1811 Miranda had better luck, and on the 5th of July he saw the Declaration of Independence of Venezuela signed at Caracas. Its centenary has been celebrated, and there is a painting of it by Martin Tovar y Tovar in the hall of the Municipal Council. Like Bolivar, he was betrayed, and in 1812 he was carried off to a Spanish prison near Cadiz. There he ended his adventures in death four years later—from scurvy and apoplexy, say the records, but strangled, the English said, in the dungeons of the Inquisition. He had kept up his correspondence with English friends like Vansittart (Lord Bexley). Pitt's eccentric niece, Lady Hester Stanhope, saw to the education of his children by his English wife.

Among passing mentions which excite curiosity, there is a letter from Gen. Alexandre Dumas, the mulatto son—legitimate—of the Marquis de la Pailleterie, and father of the novelist, saying: "I am happy to have found in the ranks of the hussars men of the same race and blood as myself—such as Miranda." Under examination by Napoleon's police (March 4, 1801), he declared that the Cabinet of London had promised the colonies of Spanish America to help to their emancipation in case of a war between England and Spain; and that France, in 1792, made a similar promise, actually naming him (Miranda) Governor-General of Santo Domingo—but the Terror stopped all. In a prison examination under Napoleon (March 4, 1801), he said:

The reason for my relations with the Cabinet of London was the liberty and independence of South America—such as France and Spain guaranteed for the United States of North America—with no monopoly in commerce and no territorial possessions for the English on that continent. . . .

This same plan we are trying to realize now through the English Government.

—What persons do you propose to use to execute your plans?

—I wish to execute them myself, using two American ex-Jesuits of Peru and three agents of the colonies who are in London.

—What may the resources of the English Government be, and what can be the object of its hope in continuing the war [with France]?

—In my opinion, England has no other resources than those which the Spanish colonies of South America offer—1° by consuming twelve to fourteen million pounds sterling of her manufactures; 2° by procuring as much more for the importation of precious metals, indigo, cochineal, "quinkina," dye-woods, vicuna, &c. Her hope is to draw after her the United States by offering them a share in this immense commerce, and so force them to join with her against France.

—Don't deceive yourselves. England, if she can only make the two Americas independent and attach them to herself, will find an output for the total amount of her manufactures and a sea force superior, perhaps, to that of the rest of the world.

Napoleon took little stock in the patriotic figures of Miranda. His millions of inhabitants for his native land, Humboldt, who was travelling there, reduced to 785,000 souls, and to less than three millions including New Grenada and Quito. It is curious that one of these reports, apparently from the French mission in London, says that George the Second's ministers would have gained control of Spanish America if it had not been

for the "perspicacity of the Jesuits, whom Spain shortly after suppressed and whose American survivors Miranda pretended to use; and that Miranda should attribute the resistance which he himself found in England to George the Third's disgust for any more American independence." The same report adds that the ex-Jesuit Viscardo, who lived in London on a pension from the English Government, was so irritated by its perfidy that he left all his precious papers to "Mr. K—— M——, of the United States," who handed them over to Miranda—who innocently gave them to this police spy to translate into French!

In this way, I was able to convince myself of the part taken by the English in the revolt of the *Indios bravos* of Sonora in the north of Mexico and at Santa Fé de Bogota in South America in 1783, as well as of the project to find a princedom there for the Duke of Kent (father of Queen Victoria)—in case the plan to make him life President of the United States should not succeed.

Miranda was for federalizing all Spanish America, North and South, under some descendant of Montezuma or the Incas. A more practical means of winning independence, as Mancini explains, was his establishment in London, 1797, of the "American Lodge" of Freemasons, in which he personally gave "light" to nearly all the heroes of the Emancipation, which he was not himself to see—from O'Higgins, of Quito, and Mier, of Mexico, to San Martin and Bolivar himself.

S. D.

Correspondence

IRRELEVANCIES OF CONTROVERSY.

To the Editor of The Nation:

Sir: In his reply to Mr. Galsworthy, printed in your correspondence columns of December 3, Mr. Schuetze calls attention to some brutal drawings in the British *Graphic* and asks, "Is it possible that a cause which seeks the inspiration of such an orgy of malice is righteous?"

In the Sunday Magazine of the St. Louis *Post-Dispatch* of December 6 I find an interesting cartoon. It is evidently a street massacre, and contains all the traditional details, not omitting the naked infant in various stages of annihilation. It is reprinted from the War Supplement of *Simplicissimus* and bears the following legend: "For such heroic deeds as these the similarly minded French have bestowed the Cross of the Legion of Honor upon the Belgian people."

Now, I do not presume to pass upon the relative merits of *Simplicissimus* and the *Graphic*. I would merely point out the futility of trying to judge any nation by what some of its citizens may do during the emotional strain of an unspeakable war. The memory of our own Civil War should make us charitable. There is in England, as in all countries, a reactionary party that is certain to become more bigoted and odious as the war progresses. In Germany the far more complete and drastic governmental organization will probably make for a more uniform level of decency. But these things are obviously superficial; they do not go to the heart of the matter. The unpardonable crime, whatever the remoter causes may have been, was setting the first match to this conflagration; and unless the German apologists can make out a stronger case than any one of them has yet done, no amount of unjust vituperation of them by their enraged enemies will serve to tip the balance in their favor.

THE SILENCE OF NEUTRALS.

To the Editor of The Nation:

Sir: In your issue of December 17 there appears, signed by Professor Peabody, of Harvard, a letter on our duty as neutrals which I hope will be answered by many persons; I wish to speak only of his recommendation of silence. He condemns "the horrors of war, the devastation of towns, the brutality of troops, the invasion of neutral territory," but he says: "To hold our tongues just now when the facts reach us with such distortion may be to hold in our hands before long the fate of the world." He looks forward to the mediation of America. Does Dr. Peabody doubt the ruin of Belgium, where seven million persons are starving? Does he deny that from these poor creatures, whom we are trying to feed, the Germans are trying to squeeze the uttermost farthing of the enormous indemnities imposed upon them for daring to defend their country against an invasion admitted by the German Chancellor to be a wrongful act? Is it our duty to hold our tongues about this? I say that Americans should not cease to denounce such sordid and infamous cruelty. The danger is not that we shall become too partisan, but that our righteous indignation may become weary. Americans are not slothful in business, but are not always fervent in spirit; like the Athenians of old, we are somewhat too eager to tell or to hear some new thing, and most of our newspapers are anxious to give us novelty and above all things not to bore us. Against an outrage such as this, which is notorious, undisputed, and expressly forbidden by Article XLIX of the Hague Convention of 1907, signed by all the belligerents, our Administration should protest and every American of common humanity should protest. To the injured party our continued silence will seem so unjust that any offer of our services as mediators would be rejected; but let us now consider only what is becoming to ourselves and to our country.

Philadelphia, December 21.

THE BLESSINGS OF PEACE.

To the Editor of The Nation:

Sir: Reading to-day the *Nation's* comment on the coming centenary of the Treaty of Ghent, that "on the 24th of this month the feeling that peace is the greatest of public blessings cannot but be uppermost in every heart," I hasten to assure you that there is at least one American who, even on that day, will not think peace a greater blessing than liberty. It seems hardly possible that there should not be others of the same way of thinking, for among our forefathers the feeling that peace is the greatest public blessing was so far from general that in 1775 they deliberately chose the horrors of a war with the mother country rather than undergo so slight an abridgment of their liberty as was implied in a tax laid on them without their consent. Among other peoples there may be other minds; yet the answer of the Athenians to the Persian demand of earth and water still stands as an example; and one is ready to believe that the Belgians, if the question were put again, would choose their suffering, their untarnished honor, and the liberty that stands intrenched in one corner of their devastated land, rather than the blessings of peace and submission to tyranny.

George De C. Curtis.

Foster, Cal., December 10.

A BRITISH PATRIOTIC FUND.

To the Editor of The Nation:

Sir: A New York committee, addressing "British residents and British sympathizers" of the country, is issuing circulars in the interest of a British Patriotic Fund. The Fund is intended, not for the relief of sickness and destitution, but to enable "British ex-non-commissioned officers, reservists, and army men . . . to return to England and serve their country in its hour of stress."

Will not all who hope to preserve the United States from international quarrel—after as well as during the present war—oppose as effectually as they can such a dangerous, though well-meaning, attack upon our adopted stand of neutrality?

Robert F. Foerster.

Cambridge, Mass., December 12.

MR. BECK REPLIES.

To the Editor of The Nation:

Sir: My attention has been called to a letter which Mr. A. R. Hohlfeld, of Madison, Wis., has contributed to the *Nation* in your issue of December 17.

Either Mr. Hohlfeld did not read my article on the Dual Alliance vs. the Triple Entente very carefully, or else, to make a point against a minor incidental feature of my argument, he fails to state what I said. It is true that, owing to an apparent misprint of the German White Paper, I did comment upon the absence of a date to the confidential communication which the German Chancellor sent to the constituent states of Germany. This was apparently an error, as it is now stated—and I do not question it—that the original document did contain July 28 as the date. I say this, although different reprints of this same document, which have come from German sources, contain different dates, one dated July 26 and another July 28. I assume, however, that July 28 is the true date, and I therefore omitted this reference to the supposed undated document in any reprints over which I had control.

It is, however, untrue that my argument with respect to the moral responsibility for the war was largely based upon the supposition that this document was undated. As a matter of fact, the reference to the undated document was a minor feature and, far from alleging that this document was written before the Servian reply to the Austrian ultimatum, I said: "Nevertheless, the document itself would indicate that it was written *after* Servia's reply on the 25th," although I suggested that in view of its want of date "it is still possible, *although not probable*, that this confidential warning was written either on the 23d or the 24th."

There has been a persistent effort on the part of my critics—and in this Mr. Hohlfeld

joins—to give the impression that I contended as a positive fact that the document was written before the issuance of the Austrian ultimatum on July 23.

It remains a very curious fact that, while the exhibits of the German White Paper are in all other respects arranged in chronological order, this document, which it is now maintained was dated July 28, is placed between a document dated July 23 and one dated July 24. Perhaps some day the very systematic clerks of the German Foreign Office will explain the reason.

As the date when this document was *prepared* can be at present only a matter of conjecture, and no convincing conclusion can be deduced therefrom, I have omitted in the reprints of my original article, and also in my book, "The Evidence in the Case," into which the article has grown, all reference to this question of dates, for I preferred that my analysis of the evidence should rest upon sound conclusions, rather than upon plausible conjecture.

Now that Mr. Hohlfeld has joined with other critics in calling attention to this matter, I may take occasion to say that, although my analysis of the diplomatic documents has been printed in a number of countries and in several languages and has given rise to widespread comment, and deals with hundreds of documents and many transactions, the only error that has yet been found in any statement that I made was in this reference to the fact that one document lacked a date.

JAMES M. BECK.

New York, December 24.

ENGLAND AND PORTUGUESE NEUTRALITY.

To the Editor of The Nation:

Sir: You will, I am sure, allow me to sustain the contrast I drew in your issue of October 29 between the German aggression on Belgium and the English treatment of Portugal in the Boer War. I wrote that, "had we chosen to violate Portugal's neutrality and advanced through the harbor of Lorenzo Marques, we could have struck direct at Pretoria and have ended the campaign in a few weeks."

Your correspondent, Mr. Martin Schuetze, comments thus in your issue of November 5: "It is a matter of record that just as soon as the British had landed enough troops in Capetown to keep the Boer armies and agents out of Cape Colony and relieve Ladysmith and Kimberley, they did move upon the flank of the Boers through Lorenzo Marques. The Boers protested to the civilized world, and especially to America, against this breach of neutrality. . . . The Portuguese were too much cowed or too partisan to speak."

Now it is a matter of common notoriety that the Boers immediately after they declared war on England—for it was they who declared war on us, not we on them—swept down into the old English Crown Colony of Natal, where we ourselves—wholly unprepared as usual—were only just able to keep them out of the seaport of Durban, which I venture to think Mr. Schuetze imagines to be one with Lorenzo Marques 350 miles north of it. He can easily assure himself, if he turns to any history of that war, that if the neutrality of Lorenzo Marques was violated at all, it was by the Boers and not by the English.

Thus Sir L. S. Amery, in the "Times History of the War in South Africa" (vol. iii, p. 102), writes as follows:

Far more important was the position of the Portuguese Colony of Mozambique, whose port of Delagoa Bay provided the only gateway between the Transvaal and the outer world. It was through Delagoa Bay that the Transvaal received such supplies as still passed through, as well as its reinforcements of foreign volunteers . . . there can be no doubt that, during the earlier part of the war, the neutrality of Lorenzo Marques was, in some respects, distinctly benevolent towards the Transvaal. For a while, in fact, Lorenzo Marques possessed for the Boers all the advantages of a seaport without any of the risk of blockade or capture by the Power which had command of the sea. Gradually, however, the representations of the British authorities had their effect. The passage of intending combatants, indeed, was not materially interfered with, but only turned into a source of revenue by the elaborate passport system devised by the Portuguese. But some check was put on the passage of goods obviously intended for military purposes.

It has often been asked whether the British Government would not have done well deliberately to have violated Portuguese neutrality, . . . but there is no sufficient reason for quarrelling with their decision to abstain from such a course. Apart from any question of political morality and of the old ties of friendship and alliance which connect England and Portugal, the international situation was not one in which England could afford to increase her general unpopularity.

The official English History of the war lends equally little support to Mr. Schuetze's statement; nor is there a word of such a violation having taken place in the History published for the German War Office.

I take little exception to Mr. Schuetze's description of the Jameson raid as "an enterprise of pure piracy," but, when he describes it as an "act of the British," he insinuates an untruth. The British nation and Government were in no way privy to it, and were as much taken aback by it, and, for the most part, as much shocked by it, as the Emperor William, who made it the occasion of his famous telegram to President Kruger. I regarded that telegram, and still regard it, as the ebullition, undiplomatic indeed, of a generous nature. Had the raid been the act of the British Government in London or of its official representatives in South Africa, I feel assured that the German Emperor would never have sent it. I admit that many Englishmen resented it as an unpardonable act of interference, but I think they were wrong to do so. It was not meant as such. In representing the raid as a violation of neutrality committed by the entire British nation, Mr. Schuetze allows himself to be blinded by anti-English animus. It was the deed of a few short-sighted members of the South African communities, provoked by the long-continued and studied affronts committed by the Boers upon the British who had settled in their midst, bringing capital to work their mines with and enriching them by the handsome prices paid for mining rights. One of the chief ringleaders of the raid was an American citizen.

I turn next to Mr. Preserved Smith, who, challenging my statement in regard to Lorenzo Marques, writes that, "as a matter of fact, England did violate Portuguese territory by moving troops through it at that time." And he proceeds to quote Sir Thomas Barclay's article on "Neutrality" in the new Encyclopædia Britannica. But here the reference is not to Lorenzo Marques, but to the Beira-Umtali Railway, constructed with English capital from the coast up to Rhodesia. The Boers were on the warpath in Rhodesia, and in April, 1900, we moved 5,000 men and munitions of war thither by the said railway. This action Sir Thomas calls "an unfortunate precedent of taking advantage of the practical powerlessness of neighboring states to commit a violation of the law of nations." He only writes thus because he interprets the Anglo-Portuguese Treaty of June 11, 1891, differently from the way in which English and Portuguese diplomats treated it at the time, in March, 1900. That treaty, which defined the frontiers of Portuguese Mozambique and English Mashonaland or Rhodesia, admitted a "servitude" on the part of Portugal, in the sense that it gave England free rights of access to Rhodesia over roads or railways to be constructed across Portuguese territory. Sir Thomas argues that the right of way claimed by England was a mere right of transit for merchandise, and that it could not in any way be construed as diminishing the neutral obligation to a belligerent who was no party to the treaty.

Whether or not this be so, there is no truth in Sir Thomas's innuendo to the effect that England on this occasion took advantage of the weakness of Portugal to violate the law of nations, and the official statement of the Portuguese Foreign Minister at the time is inconsistent with any such charge. I repeat it *verbatim* from the *Times* of April 5, 1900, so that your readers may judge for themselves whether England took advantage of her strength to put pressure upon a weaker nation. Here then is the Portuguese account of the matter:

Lisbon, April 3.—In the Portuguese Chamber, to-day, the Minister of Foreign Affairs declared that the transport of British troops by the Beira-Umtali Railway was demanded by Great Britain and consented to by Portugal because Great Britain was merely exercising rights secured to her under existing treaties. The present state of war did not abrogate these treaties, which had been concluded before the war. Portugal, in a spirit of loyalty, communicated this resolution to the Transvaal Government. Portugal had loyally maintained her duties of neutrality, and all interested parties had been informed of her course of action. The Minister added that before resuming his seat he must declare in the most emphatic manner that the relations maintained by the British Cabinet with Portugal could not be surpassed for cordiality and loyalty. He rejoiced that this was the case, and trusted that, with God's help, these relations would be maintained for ever.

From the *Times* of April 5, 1900, we further learn that on April 4 the *National Zeitung* (the National Liberal organ in Germany) admits that the Portuguese Government has not given any *special* permission for the passage of British troops, but has only publicly ratified its recognition of the right of way long ago secured by treaty. At the same time, it is recognized that the matter is one which concerns Great Britain and Portugal alone, and no other Power. The *Vossische Zeitung*, it is true, took a less impartial view, but intelligent liberal opinion in Germany was at any rate not all against us.

The Transvaal Government had been notified by Portugal on March 8 "that in accordance with the mutual explanations exchanged in the treaty of 1891 with regard to the right of moving troops and material of war through the Portuguese territory in South Africa into English territory (viz.: Rhodesia) and vice-versa, the British Gov-

ernment has just made a formal demand for all troops and material of war to be sent through Beira to the English hinterland. *The Portuguese Government cannot refuse this demand and must fulfil a convention depending on reciprocity*, a convention which was settled long before the present state of war had been foreseen. This agreement cannot be regarded as a superfluous support of one of the belligerent parties or as a violation of the duties imposed by neutrality." . . . .

The Transvaal Government, in its answer of the same day, "protested that the treaty of 1891 had not been made public, and that notice of it was received by the Transvaal at the outbreak of the war. . . . The action of Portugal would put her in the position of an enemy instead of a neutral ally, wherefore the Transvaal protested strongly against the measure" (from Amery's History, Iv, p. 367).

I hope the above data are enough to prove that Portugal cheerfully and unconstrained admitted England's right to use the Beira Railway in the manner described. To pretend that it was a violation by England of her neutrality and to talk in connection therewith of "the mote and the beam," to pretend that it was an outrage on Portugal comparable to that which the Germans are guilty of against Belgium, is absurd, and I am sure that on reflection Mr. Smith must acknowledge it to be so. If there was any real violation of neutrality on that occasion it was committed by Portugal; but I should like to know how other international jurists interpret the Anglo-Portuguese instrument of June, 1891, before I adopt the view of Sir Thomas Barclay. FRED. C. CONYBEARE.

Oxford, November 30.

MARTIN LUTHER AND THE ANGLICAN ARTICLES.

TO THE EDITOR OF THE NATION:

SIR: In your issue of December 17 I notice that Professor Smith says "It is not generally known, and would hardly be agreeable for the 'Catholic' party in the Episcopal Church to learn, that Luther had a finger in the Thirty-nine Articles." He then refers to the Thirteen Articles which resulted from a conference between German ambassadors and English divines. It is doubtless not "agreeable" for the "Catholic" party to learn of this connection, but it is certainly inaccurate to say that the fact "is not generally known." I have before me as I write the well-known "History of the Articles of Religion," by Hardwick, and my edition is dated 1859. On pp. 60-66 the whole subject of the relation of the Anglican Articles to the Thirteen Articles is carefully stated. It is now nearly sixty years since Dr. Jenkyns, in looking for remains of Cranmer, discovered a manuscript containing the Articles agreed upon at the Conference by the German and the English uthorities in 1538. Hardwick goes on to point out that while, up to the discovery by Jenkyns, the compilers of the Anglican Articles of 1553 were thought to have drawn directly from the Confession of Augsburg, the discovery of the Thirteen Articles made it probable, if not certain, that such derivation took place entirely through the medium of the Anglo-German channel.

Literature

A FAR-FLUNG EMPIRE.

The Oxford Survey of the British Empire. Edited by A. J. Herbertson and O. J. R. Howarth. In six volumes. Oxford: At the Clarendon Press. 14s. net each.

The Oxford Survey of the British Empire is a timely publication, in that it contains a detailed description of the many parts of a great empire that is at the present moment engaged in a mighty struggle not only for integrity, but even, it may be, for existence. Each of the first five volumes is devoted to a definite geographical area—British Isles, Asia, Africa, America, and Australasia—and is therefore complete in itself, while a final volume is taken up with a general survey of imperial interests and with a general historical summary. The work takes little account of the historical background, and therefore must be supplemented by an earlier, but no less valuable, publication, the "Oxford Historical Geography of the British Colonies," edited by Sir Charles Lucas.

The present survey deals with conditions as they are at the present time. In its production no less than eighty persons, with a number of lesser collaborators, have taken part, and it is profusely illustrated with excellent photographic reproductions, some of which are of great beauty and all of value, and with many maps in color and in black and white. The colored maps are well executed, with the single exception of those of Australia, while the inserted black and white charts and diagrams are useful, though of varying quality. Accompanying the text are bibliographies, gazetteers, and statistical tables in profusion, and each volume is well indexed. The editorial supervision has been efficient, and the style of the articles, the arrangement of the subject matter, spellings, and other aspects, so often at variance in a coöperative undertaking, have been kept well in hand. As far as observed, few errors of fact have crept in, though one capital blunder appears in volume four, where British Honduras is stated to be situated "on what is termed the Mosquito Coast," whereas the latter is an Indian reserve on the eastern coast of Nicaragua, from which England has withdrawn all rights of protectorate in favor of the Nicaraguan Government. The statement that "after the Restoration the plantations were no longer considered to be demesnes of the King, but were treated as part of the territories or dominions of England," is likewise erroneous, inasmuch as the British colonies in America were never deemed parcels of the realm at any time in their history.

As a whole, the volumes are well written and readable, and are to a noteworthy extent free from technical language and the nomenclature of the specialist. They are available, therefore, for general reading. This is a matter for congratulation, inasmuch as the work presents an impressive picture of the strength and resources of the British Empire. Each volume deals with a wide range of subjects, inevitably varying in the fulness and range of their treatment, and each is so made up as to furnish the traveller and tourist with just the kind of information that he ought to have, but cannot obtain from the average guide-book. Here are careful and accurate accounts of climate, vegetation, fisheries, agriculture, minerals, trade and production, railways, shipping, ports, canals, roads, population, race and language, public administration, government, defence, town and rural life, religion and churches, and the like, dealt with for every part of the British Empire as far as they go. Not even the smallest fraction of territory under British authority is left out. Papua, Hongkong, Wei-hai-wei, and all the Pacific and Atlantic islands receive a proportionate treatment. Noteworthy chapters are those of Sir Basil Worsfold on the problems of the South African Union, of Dr. Grenfell on Labrador, of J. D. Rogers on Newfoundland, of Sir R. C. Temple on Western Influence in India, and the introductory survey by Sir G. H. Reid, on Australia, in which the former Premier asserts that "Australia today is as truly British as Britain itself." All things considered, the least satisfactory chapters seem to be those that concern the British West Indies.

For the reader at large the chapter on imperial defence in volume six, and the supplemental chapters on the same subject in volumes one and five, will have a leading interest at the present time. It is significant that all are anonymous and bear internal evidence of having been written by the same hand, manifestly by one able to speak with authority. The general chapter contains a declaration of policy so pertinent to present-day affairs that it deserves to be reproduced without abbreviation:

Our friendships are based on the fundamental principle of our policy. The dominating factor in the formation of our present friendships has been the growth of the German navy. Whatever the real intention may be that has dictated its great development, we cannot afford to view its further expansion with indifference. For should that policy at any time develop aggressive tendencies against ourselves or against any of those Powers with whom we are friends, we are bound to come to the assistance of the latter or run the risk of a subsequent coalition aimed at our sea supremacy. The conclusion that is forced upon us is that our foreign policy is bound to concern itself with the maintenance of military equilibrium in Europe, and may consequently involve us in a Continental war, in the result of which the dominions are greatly interested on account of the ultimate effect of such a war on their sea-borne trade. This statement must, however, be qualified by saying that the situation that would be dangerous to ourselves cannot arise unless some Power or group of Powers on the Continent aspires to assume a dominating position. This view is, of course, not accepted by those holding certain political views in this country, and has frequently been criticised in the dominions, and the absence of a solid and unanimous opinion in favor of sending armed assistance to our friends in certain circum-

stances would inevitably be found embarrassing by the Government of the day in a time of acute crisis.

In this chapter, apparently written at the time of the crisis of 1912, we have an ample explanation of the recent policy of Sir Edward Grey and the British Government.

CURRENT FICTION.

Sons of the Rhine. ("Die Wiskottens.") By Rudolf Herzog. Translated by Louise T. Lazell. New York: Desmond FitzGerald.

The Wiskottens are properly sons of the Wupper; in that soiled but efficient stream they find their profit and their joy. Sons of the Rhine sounds better, and if, as many publishers appear to think, a title is merely a form of bait, this is doubtless a good and timely choice for an English version. With the startling red, white, and black cover, it seems to promise much shouting and at least a little fighting for the Fatherland. In fact, not all sons of the Rhine, or of the Wupper, have learned to live for that valued abstraction, United Germany. This is a story of provincial and industrial and domestic Germany. The pride of the Wiskottens is in the family character and the family business. Their loyalty extends itself to their servants and the workers in their mills, and so comes to an end. On page 3 of this narrative there is mention of military service as a thing to be avoided, and of the Kaiser in connection with moustachios; and that is the last we hear of either. The Wiskottens are sufficient unto themselves. The father, by industry and economy, has built up a small weaving business. His six sons make a great industry of it. Gustav, the eldest, is their leader; his self-sacrifice has gained capital by marriage, and his enterprise and daring have applied it to a rapid development of the business. The other brothers differ greatly, but all have a strong clan feeling, and all except the youngest, Ewald, are devoted to the family fortunes. But even Ewald is to be turned to account; his attempt to be an artist fails until he turns his hand to pattern-making for the Wupper mills, when he becomes the source of new prosperity, and of the overthrow of the wicked competitor, who chances to be Gustav's father-in-law.

Family loyalty and industrial conquest, not patriotism and military supremacy, are two of the idols here set up for worship; the third is domestic happiness. The whole treatment of this theme in connection with Gustav's marriage is amusingly German in its blending of sentimentalism and the main chance. The poor fellow has had to marry Emily for her money. He does not disguise the fact that it is a cross, and she is foolish enough to resent the situation even after she has borne him children. He is naturally amorous, and has grown fond of her; yet she presently deserts him. He perceives that she must be brought to heel, and achieves it by silence. In the end, contrite and more than submissive, she returns to his arms. The terms in which the united pair sum up the case show that Continental fastnesses remain where the despised "mid-Victorian" doctrines still hold out. "The woman," cries Emily, full of magnanimity, "the woman is responsible for everything that goes wrong in marriage. She has time and to spare, while the man works. It is her duty to be sweet and beautiful, and clever too. When men come home tired from their work they need cosseting." Gustav does not see his way to contradicting this, but has his own generous ideal: "Now, at least, I know what I'm working for. So that your eyes may keep bright, your hands soft, for me. . . . To think that I am weaving a crown, a crown to lay on your loosened hair, sweetheart, when night falls. That's the only kind of poetry I understand."

Obsolete matter for the enlightened Anglo-American reader; but, fashions aside, there is much warmth and even humor in this picture of German family life; in spite of an English version which too often fails in escaping the original idiom.

Selina. By George Madden Martin. New York: D. Appleton & Co.

The author of "Emmy Lou" has tried here to draw a picture of the girl of the 'eighties, with her dawning consciousness of that problem of personal integrity and independence which has since been so publicly and gloriously expounded. She is shown standing, dazed but not quite helpless, at a parting of the ways. "As I read this girl and the conditions surrounding her, born late Victorian, she came into being when those sincere and fine tenets upon which the Victorian age founded itself were become the letter of the original vital idea, and the moment itself sentimental, trite, and prudish. Outcome and victim of an hour so flabby and platitudinous, this young girl of the Victorian '80's, apparently not only repudiated her condition made up of absurdities, futilities, and inadequacies, but her maturity has lapsed over into the post-Victorian era as pioneers, she and her companions of that day, who blazed the way for the army of women now following." Selina does not succeed in solving the problem for herself. Her author, as she alliteratively confesses, has seen her at a moment "piteous rather than pertinent, helpless rather than heroic, and groping rather than grasping." In describing her and her little friends, the writer has also indulged an intense, almost voluptuous, feeling for the charms of young girlhood which has been noticeable in her earlier work. She cannot mention a young female in her teens without labelling her a dear child, or a sweet thing, or a pretty creature. Selina is, with or without her beauty, a nice enough girl, and perfectly fitted for that flapper-worship which still determines the course of romantic fiction. We leave her, after various tentative and unsuccessful ventures towards self-realization, "finding herself a little bit"; and by that token refusing to marry her nice young man because she has not yet proved her economic worth. "When I come to marry," she cries, "it's going to be because I choose to give up independence"; the "post-Victorian" battle-cry of the sex, sure enough—or is it only of a war-party?

We Are French! By Perley Poore Sheehan and Robert H. Davis. New York: George H. Doran Co. 50 cents net.

It is always a hazardous undertaking for the Anglo-Saxon to attempt to write of the Latin from the Latin point of view, but if one wishes to know precisely the spirit which to-day animates the whole French nation, one will find it exquisitely indicated in this book; not "expressed" with painstaking Anglo-Saxon bluntness, but revealed by implication, inference, suggestion. The story is of a French Damon and Pythias—two old Zouaves, veterans of the French campaign of 1871 in Africa. Somewhere in the annals of French arms is the epic of the bugler, who, surrounded by hostile Arabs, was told to sound the "retreat" to save his life, but who sounded, instead, "Charge!" This is the deed attributed to old Anatole Picard, for which, forty years later, he is invited to come to Paris to receive his decoration, in the presence of the President of the Republic. The two old Zouaves decide to walk, and bring out their old Zouave uniforms with their atrociously baggy trousers and short braided jackets. It is then that the authors reveal their intimate knowledge of the French, in the words, "Ah, those uniforms! such red! such blue! such shining brass!" A sentiment that, lingering until to-day, has cost tens of thousands of lives, because the red and the blue make their wearers good long-range targets. The old Zouaves begin to near their goal: "The villages through which they passed began to look like detached fragments of Paris itself. . . . The same sort of change was apparent in the people. . . . The villagers stared at them with more curiosity than kindness. Workmen and young idlers were apt to smile cynically as they passed. Even the gendarmes appeared cold." After the early picture of the village life they had left, with all its simple, hearty comradeship, nothing could better express the difference between Paris and the rest of France.

Betty's Virginia Christmas. By Molly Elliot Seawell. Philadelphia: J. B. Lippincott Co.

All the ingredients of the standard Southern love-story are here employed, skilfully enough for the purpose: the Colonel, sir! the old estate with its mortgages, the Northern interloper, the fair and silly Southern maiden, the faithful family nigger, the fox-hunt, the dance, the julep, the punch-bowl, the rescue, the quarrel, the general mush of comfortable sentiment at the end. Betty is married to her gallant Yankee lieutenant, and has "the most beautiful baby ever seen." Even after that, we linger to see Betty's baby christened out of the Colonel's eggnog bowl, and presented with the Colonel's sword, with a speech by the donor. The final scene, which takes place very shortly after the incident of the eggnog

bowl and the sword, shows the Colonel making a good try at Colonel Newcome's record for death-bed pathos:

The Colonel's eyes suddenly brightened, and he raised his thin figure in the chair, and his eyes saw into another world.

"Hear the music," he said. "The band plays very well to-day; it is playing a fine march for the dress parade. Give me my sword."

Uncle Cesar reached up and took the sword from where it hung over the mantel, and put it gently in the Colonel's wasted hand. With his feeble strength the old man drew it half out of its scabbard, and looked at it.

"It is bright," he said. "There has never been a stain upon it. Here comes the commanding officer. Turn out the guard."

Uncle Cesar, who knew what was at hand, answered reverently:

"Yes, old Marse. The guard is turnin' out."

Then, raising the sword to the salute, the gallant old Colonel heard the last order to fall in, and met, face to face, humbly, but without fear and in perfect peace, the Great Commander.

Excellent matter for the movies!

SOCRATES AND PLATO.

Greek Philosophy: Part I, Thales to Plato. By John Burnet. New York: The Macmillan Co. $2.50.

For this volume of Sir Henry Jones's Schools of Philosophy no scholar in Great Britain was, from one point of view, better prepared than Professor Burnet, both by his extraordinary knowledge of Greek in general and by his special studies in editing the text of Plato and in writing his history of "Early Greek Philosophy." And he has excellent qualifications as a writer. He is always clear and precise and vigorous, though it must be admitted also that his style lacks something of grace and fails to rise in eloquence to the greater heights of his theme. This defect is due, no doubt, to the same bluntness of imagination, or lack of intellectual refinement, which led him to transliterate the personal appellations directly from the Greek, giving us such needless crudities as Sokrates (why not Sôkratês?) and Sokratic. If consistency is so great a virtue in his eyes as to warrant contempt for common usage, why, one asks, does he write Cyrus for Kyros or Kuros, or the Persian form of the word, whatever that may be, and Zeno and Plato for Zenon and Platon? There is even a certain absurdity in his system when on the same page he gives "Theætetus" as the name of the dialogue, yet transliterates the protagonist of the dialogue as Theaitetos. But, if not elegant, the book is one to read and digest, to learn much from, and in part to disagree with sharply. No one interested in philosophy can afford to pass it by.

Professor Burnet's treatment of the earlier schools we must leave unnoticed, though there is scarcely a page in these chapters which does not show the working of a mind keenly original and enormously erudite. Particularly noteworthy is the section on Pythagoras and the Pythagoreans, and, indeed, one of Professor Burnet's pet theses is the deep and continuous influence of the Italian school on Socrates and all the later modes of Greek thought. It is a thesis in which most students will be ready to follow him far, though, perhaps, not quite so far as he would like to lead them. The most important, or at least the most debatable, aspect of the Pythagorean influence is in the doctrine of ideas. These he connects skilfully, and no doubt correctly, with the actual geometric forms produced by the arrangement of points to represent the square numbers (4, 9, 16, etc.) and the oblong numbers (6, 12, 20, etc.). In this way the connection between form *(eidos)* and number is presented in a simple and visible manner, and a perfectly clear meaning is given to Plato's exclusion of any one not a geometrician from his Academy. The questionable phase of the theory is seen in Professor Burnet's insistence on translating *eidos* always as "form," instead of rendering it by "idea" as is customary when dealing with the more advanced philosophy of the Platonic school. He sins a little by over-simplicity, where others, perhaps, have erred in the contrary direction. Professor Burnet's Pythagoreanism gives an easy explanation of Plato's continued interest in numbers—his mania, some would say, thinking of certain hard passages in the "Republic" and "Timæus"—but it leaves out of the Platonic "ideas" too much of that overgrowth of the imagination and that poetic visualization which have made them for two thousand years one of the great sources of inspiration, for good and for evil. To discover only a bare intellectualism or conceptualism in the visionary flights of the "Phædrus" is to miss one-half of Platonism. "The 'supercelestial region' [of that dialogue]," he maintains, "is clearly identified with that of pure thought, and the forms the mind beholds in it—Righteousness itself, Soberness itself, Knowledge itself—do not lend themselves in any way to crude pictorial fancies." To use the word "crude" is really to beg the question; but to suppose that the "Phædrus" does not exhibit in Plato's mind something that outruns a pure rationalism, to fail to see in it a mysticism of vision which the negations of dialectic cannot reach, is to make of Platonism something very different from what innumerable scholars have confidently believed it to be—and from what the listeners in the Academy themselves heard.

And the same sort of reservation must be applied to Professor Burnet's analysis of the later dialogues and to his account of Plato's matured system of teaching in the Academy. The description of that school as the first great university of Europe, the insistence on the scientific research in which the students were engaged, the emphasis on the practical side of the political discipline which sent legislators and rulers from Plato's classrooms over the Greek world—all this is an excellent corrective to the too common notion of the Academy as a congregation of visionary and talkative dreamers. Professor Burnet might have enriched his description by quoting from Cicero's marvellous description of the Old Academics in the fifth book of the "De Finibus":

From their writings and teachings can be learned the whole of liberal culture, of history, and of style; moreover, they include such a variety of sciences (*artium*) that without the equipment that they give no one can be adequately prepared to embark on any of the higher careers. They have produced orators, generals, and statesmen. To come to the less distinguished professions, this factory of experts in all the sciences has turned out mathematicians, musicians, and physicians.

Professor Burnet has done well to lay weight upon the character of this *omnium artificum officina* as a great school of scientific research and of practical sociology; but he does not do well to slur over the chief aim of the school in its work of producing "liberal culture" (*doctrina liberalis*) and in its profound religious inspiration. He closes his discussion of the Academy, and his book, with the statement that by solving the problem of the irregular motion of the planets Plato "laid the ghost of the two-world theory which had haunted Greek philosophy since the time of Parmenides." Such a statement is worse than misleading in its inadequacy. In one sense Plato did indeed transcend the dualism that runs through so much of earlier Hellenic thinking; but he did this only by introducing, and fixing as part of the world's spiritual heritage, a profounder kind of dualism. Professor Burnet has read through his Plato many times. He should not have forgotten the "two-world" feeling that permeates the later dialogues, written when the author had passed quite beyond what Professor Burnet holds to have been the more mystical philosophy of Socrates. "We must suppose," says the Athenian in the "Laws," "that there are at least two souls [in the moving universe], one the author of good, the other able to accomplish the contrary of good." That "two-world theory" was not disposed of by mathematical demonstrations; and to ignore it is to miss the heart of Platonism from its inception to its close.

As already intimated, Professor Burnet reaches this view of Plato as a scientific rationalist by means of an original, not to say startling, view of the relation of Plato to his master. According to this theory, all the dialogues up to and largely inclusive of the "Republic" are purely dramatic and contain nothing of Plato's own contribution to philosophy. Plato, in fact, had no thoughts of his own during this period of his life, but was content to sink himself entirely in his teacher. The doctrine of ideas, as presented in these dialogues, is not Platonic, but was taken over by Socrates from the Pythagoreans and made his own by substituting the theory of participation for that of imitation:

The Pythagorean doctrine of imitation left the sensible and intelligible as two separate worlds; the doctrine of participation makes the sensible identical with the intelligible, except that in sensible things the forms appear to us as a manifold instead of in their unity, and that they are only imperfectly embodied in the particulars.

Socrates thus occupied, so far as "ideas" are concerned, a middle ground between the dualism (*chôrismos*) of Pythagoras and the scientific monism of Plato. And not only is the doctrine of ideas in its most essential stage due to Socrates, but the mysticism, the religious feeling (or "religiosity," Professor Burnet might perhaps say), the poetical enthusiasm, are also non-Platonic, having come full-fledged to Socrates from the Orphic and Pythagorean cults, though held in check by his peculiar sense of "irony." It is important to present this view in Professor Burnet's own words:

> I am firmly convinced that the mystical side of the doctrine of forms ["ideas"] is due to Sokrates and not to Plato. We know certain facts about him, such as his "voice" and his trances, which prove him to have possessed the mystic temperament, and we know certain facts which explain the manner in which he conceives the mystic love. . . .
>
> He was indeed a visionary or "enthusiast," in the Greek sense of that word, but he was also uncommonly shrewd. His critics called him "sly," using a word (εἴρων) which is properly applied to foxes. The Scot's word "canny" (not always a term of praise) comes nearest in meaning to the Greek. . . . To a very large extent, we gather, "the accustomed irony" of Sokrates was nothing more or less than what we call a sense of humor which enabled him to see things in their proper proportions.

That, according to Professor Burnet, is the true Socrates as he was in his later years and as Plato knew him. Of Xenophon's "Memorabilia" our author takes slight account, waving them aside as of no historic value. But there was also an earlier and different Socrates, of whom we have scattered glimpses in Plato and a full-length portrait (caricatured, of course) in Aristophanes. It has been one of the problems of scholarship to reconcile the picture of Socrates in "The Clouds," as a fantastic investigator of nature and leader of a band of pallid students, with the philosopher of the streets, who brought philosophy down from the sky to this earth. Professor Burnet solves the difficulty by frankly accepting both portraits, and attempting to establish a break between the younger student carried away by the scientific theorizing of the day and the mature philosopher whose interests were wholly ethical and religious.

Now, any theory of so complete a scholar as Professor Burnet is worthy of consideration, and his thesis in regard to Socrates and Plato has the unquestionable value of offering a correction to certain current views. But in some points, and those of very grave importance, it is, in the opinion of the present reviewer, demonstrably false and even pernicious.

That there was some sort of cleft in the life of Socrates, a period of interest in the physical causes of phenomena preceding his ethical period, is a well-attested fact; but it may be questioned whether Professor Burnet's treatment of this division does not raise it into the region of conjecture. In the main, we think the conjecture is sound and useful, though probably somewhat exaggerated. Professor Burnet is not the first scholar with a theory to push it too far—even outside of Germany.

Again, that there was a deeply religious, even a mystical, element in the character of Socrates seems to us demonstrable, and to set this forth as Professor Burnet has done is to perform a good service, in view of the inadequate conception of Socrates made widely current by the "Griechische Denker" of Theodor Gomperz. According to that brilliant and much-quoted history, we are to reject all the religious and exhortatory traits of the Platonic Socrates for a mere questioner and promoter of the *Aufklärung*. The teacher of Plato was no *Mahnredner* or *Tugendprediger;* the story in the "Apology" of his self-dedication to the service of the god is pure moonshine; he had one simple task, to set forth the unity of knowledge and virtue, and to that end there was no need of exhortation or animating appeal, no room even for any positive ethical teaching, etc., etc. Now the Socrates of Gomperz is simply impossible—a creature manufactured in a Teutonic *phrontistêrion*, and not the living man of Athens from whom the deepest inspiration of philosophy has flowed even to this day. Gomperz himself offers a corrective to his portrait by quoting as the motto for his volume the words from Clemens Alexandrinus: "Wherefore also Cleanthes in his second book concerning Pleasure says that Socrates always taught that the just man is the happy man, and *cursed* the first man who distinguished between the just and the profitable *as one who had done an impious thing*." There is decidedly something of the *Mahnredner* and *Tugendprediger* in the words underscored, though we need not, for all that, picture Socrates quite as a Lutheran parson. If Clemens is right, and Plato was not a mere mystificator, and there is any propriety in calling all the later stream of Greek thought Socratic, and if common-sense has any place in the study of philosophy, then Gomperz is wrong. We may be certain that beneath the irony of Socrates, deeper than his questioning of popular phrases and his search for precision of definition, lay a power of very positive ethical teaching and an emotional appeal, in the master's own way and at his own time, which smote the heart even of such a worldling as Alcibiades to the quick, and shall never cease to vibrate in the hearts of living men.

This is, perhaps, not exactly the tone of Professor Burnet's treatment of Socrates, but his emphasis of the religious and even the mystical side of Socrates's character is in the right direction—even if carried by him too far. But why must he rob Peter to pay Paul? To maintain that the thought of the earlier dialogues is purely Socratic and in no sense Platonic, to hold that Plato was a mere dramatist when he wrote the "Republic," with no philosophy of his own to develop and expound, is to go to the other extreme. Such a view seems, to the present reviewer at least, to be little short of nonsense.

Professor Burnet bases his revolutionary theory mainly on the intricate question of "ideas," taking refuge in a metaphysical jungle from which it would be difficult to dislodge him. It is easy to maintain that between the earlier dialogues, including the "Republic," and the later dialogues there is a fairly sharp break in the use of the word "idea," and to conjecture, therefore (it can be only conjecture), that the one use is Socratic and the other Platonic. But the difficulty of dealing with such an argument lies in its obscurity; notwithstanding all that has been written on "ideas" and may yet be written, we are not likely to have any clear conception of what they meant exactly to Pythagoras or Socrates or Plato. It is safer, therefore, to waive that argument altogether and to approach the distribution of the Platonic philosophy from another angle. If we can find one question of supreme importance the treatment of which in the principal dialogues of the earlier period shows a perfectly clear progress from the simple point of view known certainly to be that of Socrates to a point of view not essentially different but more profoundly developed, we shall be pretty safe in concluding that these dialogues are not merely dramatic expositions of Socratic teaching, but indicate chronologically the growth of Plato's own philosophy. Professor Burnet argues from the supposition (extremely uncertain in itself) that a certain doctrine of ideas appears in the very first dialogues and remains the same through the whole early group, and then undergoes a sudden change; his inference loses its force if another philosophical thesis, simpler and clearer in itself, shows a complete development within the early group.

Now, just such a thesis we find in the relation of justice to pleasure (*hêdonê*) and to happiness (*eudaimonia*), as expounded in the three great dialogues, the "Protagoras," the "Gorgias," and the "Republic." The matter is too large to be adequately treated in a review, but the essential steps in the progress may be indicated thus: In the "Protagoras" the argument runs that pleasure is a good and pain an evil. If, therefore, men are to be persuaded to follow justice or virtue, they must be taught that such a life in its sum imparts more pleasure than the contrary life. The conclusion may be given in the excellent language of Berkeley's attempt to undermine the vicious conclusions of hedonism ("Alciphron," II, xviii, abridged):

> But Socrates, who was no country parson, suspected your men of pleasure were such through ignorance of the art of reckoning. It was his opinion (Plato in Protag.) that rakes cannot reckon. And that for want of this skill they make wrong judgments about pleasure, on the right choice of which their happiness depends. To make a right computation, should you not consider all the faculties and all the kinds of pleasure, taking into your account the future as well as the present, and rating them all according to their true value? And all these points duly considered, will not Socrates seem to have had reason on his side, when he thought ignorance made rakes, and particularly their

being ignorant of what he calls the science of more and less, greater and smaller, equality and comparison, that is to say of the art of computing?

That, if we know anything of the matter, is the pure Socratic logic, admirably summed up from the "Protagoras" by a master mind. But Plato soon found that the identification of happiness with the larger sum of pleasures offered an exceedingly slippery foundation for morality. In the "Gorgias," therefore, he attacks the question of pleasure, and in the insolent words of Callicles carries the philosophy of hedonism to its logical extreme. In reply Socrates proves that pleasure is not identical with the good which all men pursue, and cannot in itself be made the support of justice. Not even the great King of Persia, to whom every source of pleasure is open, is necessarily *happy*, for we do not know how he stands in the matter of *education* and *justice*. Here, and elsewhere in the "Gorgias," the great conclusion is adumbrated: pleasure and happiness are not distinguished quantitatively, but qualitatively, and the just life is to be preferred for reasons apart from any computations of pleasure and pain. We find Plato groping, as yet darkly, for this certainty of self-knowledge by which he was to make the Socratic philosophy the religion of the world. In one sense he is discovering a truth that is the contrary of the Socratic hedonism of the "Protagoras"; in another sense he was merely rendering explicit what was implicit in that hedonism, or, rather, correcting Socrates's imperfect logic by Socrates's perfect intuition; for the final fact for which Socrates stood was not a theory of pleasure and knowledge and virtue, not a rationalizing hedonism, but the simple affirmation of ignorance of everything save of this one truth: that justice is preferable to injustice, that it is better, if needs be, to suffer injustice than to do injustice, and that somehow he had never met a man who could argue against this intuition without in the end making himself ridiculous.

This correction of Socrates's logic by a re-examination of his hypotheses in the light of his own intuition, adumbrated in the "Gorgias," is, in the "Republic," wrought out in all the splendor of reason and imagination. The psychological dualism upon which rests the distinction between pleasure and happiness is elaborated and illustrated (notably in the tale of the man passing the *barathron*) in such a way as to leave little room for further development, and justice, now defined as a condition of the soul known to the man himself by his happiness, is rescued from the ambiguities of a calculating hedonism.

If this analysis of the three greatest of the early dialogues is correct, the whole theory of Professor Burnet, based on the doctrine of ideas, falls to the ground.

It may seem that much space has been taken to refute a book which the reviewer confesses to have found in many respects admirable. As a matter of fact, Professor Burnet's pages are scattered with keen *aperçus*, and his scholarship is everywhere in evidence, but the main thesis of his work is at least of a sort that challenges disagreement.

A CRITIC ON HIS ART.

Criticism. By W. C. Brownell. New York: Charles Scribner's Sons. 75 cents net.

When Mr. Brownell sent forth this little volume on the art of which he has been for nearly thirty-five years an accomplished practitioner, one can fancy that he repeated *sotto voce* the somewhat melancholy words of the "faultless painter" to his Lucrezia: "You don't understand nor care to understand about my art, but you can hear at least when people speak." Every one, of course, who knows anything of these matters knows that Mr. Brownell's "French Traits," his "French Art," his "Victorian Prose Masters," and his "American Prose Masters" are works of rare distinction in the field of American criticism—works in which singularly acute and unintermittent thinking is expressed with almost flawless precision. To that select audience which writing of this nature and quality makes for itself, it need only be said that the treatise before us is related to the preceding critical essays as Poe's "Philosophy of Composition" is related to his verse and his stories, or as Arnold's "Study of Poetry" is related to the second series of "Essays in Criticism." As for that amiable Lucrezia, the general American public, however, it may be surmised that she is not "up" to Mr. Brownell's impeccable art from her otherwise inexplicable failure to exact of him a higher degree of productivity.

It should be pointed out that a critic of his standards will hardly enter upon his task before the age of forty. He must outlive so much emotional ferment and acquire so much intellectual culture before he can attain the high rational disinterestedness, poise, and serenity proper to criticism. Though technical expertness is not to be demanded of him, he must be prepared to deal with multifarious "moral data," to "disengage the qualities which inform the technique," and to value them. His function presupposes a "large and luminous view of life and the world," to which an adequate acquaintance with history, æsthetics, and philosophy is essentially contributory. His criterion is not the epicurean delight of the impressionist nor the rigid formularies of the academic dogmatist, but principles tested and approved by taste, time, and reason or sense, which last is to be incessantly engaged in checking and scrutinizing the chameleon sensibility. His method, finally, is by a close persistent analysis to establish a preconception of personality redefined in an ultimate synthesis. And the highest service of criticism "is to secure that the true and the beautiful, and not the ugly and false, may in wider and wider circles of appreciation be esteemed to be the good."

To move the widest circles, Mr. Brownell is a little too impersonal, a little too free from prejudice, a little too civil, urbane, and catholic, and a little too remorselessly intellectual. His style, furthermore, is somewhat too elaborately considered. Though it is invariably clear and bright, it is slightly deficient in charm; it is brilliant but devoid of glamour. One is tempted to quote to him his own comment upon Rodin: "In fine, the most one can say, I think, about the inadequacy of Rodin's technical 'finish' is that his devotion to expression . . . perhaps blinds him to an occasional opportunity of decorating sufficiency of expression, of statement, with that touch of purely sensuous and irresponsible agreeableness which adds nothing—save pure delight!—to its force or significance." To which Mr. Brownell might reply that in rejecting impressionism he has deliberately eschewed the "irresponsible exercise of the nervous system." As he elsewhere puts it in his admirable essay on Arnold, whom he regards, despite a deficient interest in painting and the plastic arts, as the first of critics: "What criticism lacks, and what will always be a limitation to its interest and its power, is the element of beauty, which it of necessity largely foregoes in its concentration upon truth."

Mr. Brownell's criticism pursues truth with fine concentration upon its object—and with very notable technique. One wishes for this discourse a wider influence than it is likely, one apprehends, to exert; for it is full of valuable distinctions, wise counsel, and technical hints of which American criticism generally stands in crying need. One wishes particularly that this book may put readers and writers upon a reëxamination of Mr. Brownell's other works, which illustrate and justify it.

THE FIRST CHRISTIAN EMPEROR.

Constantine the Great and Christianity. By Christopher Bush Coleman. Columbia University Studies in History, Economics, and Public Law. Columbia University Press; Longmans, Green & Co. $2.

The problem of the real attitude of the first nominally Christian emperor towards religion in general and towards the Christian religion in particular is one of perennial interest to students of history. Whether they are concerned primarily with the history of the church or with that of the empire as a whole, they find in a solution of this problem the key to many of the most perplexing problems of that age of transition.

It is, therefore, a very distinct service which Dr. Coleman has rendered in this new study of a subject already treated from almost every conceivable point of view. His purpose is not to offer new material or even to propose novel interpretations of familiar texts, but to summarize and to comment independently upon the views already brought out in the discussions of a generation past.

His plan has a certain suggestion of novelty and certainly tends towards clearness

of presentation. He divides his treatment under three heads: the Constantine of history, the Constantine of legend, and the Constantine of fiction. Of these divisions the first is the largest and the most important. It includes a fair statement of the problem, followed by an examination of the emperor's reported legislation, his coins, inscriptions, and alleged writings. Then we have an examination of the evidence as to his patronage of Christianity, his gradual change of emphasis from the pagan to the Christian side, and his final acknowledgment of Christianity as his own personal religion by the act of baptism. The second section comprises a survey of the most familiar legends of Constantine, both Christian and pagan, with a view to drawing from them whatever of historical suggestion they may contain. The third part is devoted almost entirely to a study of the famous "Donation," with a history of its reception through the centuries and a brief summary of the arguments against its genuineness. Three appendices give respectively the text of the account of Constantine's conversion in the *Vita Sylvestri*, that of the *donatio*, and that of the first modern criticism of the "Donation" by Nicholas of Cusa.

Dr. Coleman writes as an historian, without prejudices and with a laudable desire to present all sides of a very complicated situation; but he does not succeed, after all, in disentangling the skein. He has read his material, but he cannot get away from it into the perspective needed to command it. He does not wholly escape from the conventional scheme which would make of Constantine either a pagan or a Christian, or else an impostor. He shows, indeed, that he has tried to do this, but he has not worked himself out into a clearness of view that will greatly help the reader. For example, though we have frequent references to the prevailing syncretism of the time we find no adequate study of Constantine's relation to other religions than Christianity by which the apparent inconsistencies in his attitude might be at least partially explained.

It would be interesting to know to what extent Constantine, like many another Roman, indulged in the luxury of having several religions at the same time in order, as he more than hints in the Edict of Milan, to "make himself solid" with every form of divinity there was going in the wide empire he sought to rule.

Nor is there, with all the abundant reference to sources, any careful study or comparison of them. It is not enough to say that Zosimus—who, by the way, twice appears as "Sozimus"—was a "pagan historian" who writes with "characteristic spleen." We ought to know, if our author can tell us, what determined his attitude towards things Christian and, so far as is possible, we ought to be furnished with some sympathetic understanding of that attitude. So, on the other hand, without some similar appreciation it is idle to cite the statements of Eusebius as having any value that can be called convincing.

Notes

The Index of the *Nation*, July to December, will be printed with the issue of January 7.

Houghton Mifflin Company announces the forthcoming publication of "The Rocky Mountain Wonderland," by Enos A. Mills.

The Macmillan Company will publish next month a volume of hitherto unpublished poems by Robert Browning and Elizabeth Barrett Browning, with an introduction by Frederick C. Kenyon. The same company announces the forthcoming publication of "Mrs. Martin's Man," by St. John G. Ervine.

The publication is announced of the complete report of the proceedings of the First National Conference on Universities and Public Service. Copies, which may be obtained of Edward A. Fitzpatrick, Box 380, Madison, Wis. (price $1), will be sent free to trustees and other university officials, public officials, editors, and librarians.

The Harvard University Press announces the following books for publication this winter: In literature—"Essays on Chaucer," by George Lyman Kittredge; "The History of Allegory in Spain," by Chandler Rathfon Post; "Poems of Giacomo da Lentino," edited by E. F. Langley; "The Supernatural in Tragedy," by Charles Edward Whitmore. Government and economics—"Some Aspects of the Tariff Problem," by Frank William Taussig; "The Trust Problem," by E. Dana Durand; "The Enforcement of Decrees in Equity" (Vol. I of the Harvard Studies in Jurisprudence), by Charles Andrews Huston; "A Bibliography of Municipal Government," by William Bennett Munro; "The Anthracite Coal Combination in the United States," by Eliot Jones; "English Field Systems," by H. L. Gray; "The Evolution of the English Corn Market, from the Twelfth to the Eighteenth Century," by N. S. B. Gras; "An Approach to Business Problems," by Arch Wilkinson Shaw. History—"Wraxall's New York Indian Records, 1678-1751," by Charles Howard McIlwain.

Prof. Svante Arrhenius, of Stockholm, announces, in view of the European situation, the postponement of distribution of the Nobel prizes by the scientific and literary institutions of Sweden until 1915. Heretofore the formal presentation of the prizes in medicine, chemistry, physics, and literature has been held on December 10, the anniversary of Nobel's death. The mere anouncement of the awards will still be made on that date, the actual presentation to take place hereafter in June of the following year.

Numerous books about the war must be dispatched with briefest indications of their temper and worth. Edmund von Mach's "What Germany Wants" (Little, Brown; $1 net) describes Germany as essentially pacific, but impelled by pressure of population to seek new territory and new markets. "She had to find ever new markets in the world or starve." In the quest England seemed to thwart her; hence a sort of inevitable conflict. As a statement of the perverted political psychology of the Vaterland, the book has a certain value. On the side of cold fact, though Germany may have felt hemmed in, she was not. No nation with a rapidly advancing commerce who imports annually some fifty thousand laborers to gather her crops is really suffering from overpopulation, or even figuratively in danger of starvation. Dr. von Mach's book will with impartial readers increase the sense that Germany's wants were inordinate. The general dignity and moderation of Dr. von Mach's plea are as remarkable as its logical thinness.

"The German Enigma," by Georges Bourdon (Dutton) is the report of an *enquête* made by a highly trained Parisian journalist in Germany last year. He interviewed, among others, Herr von Kiderlen-Waechter, von Bethmann-Hollweg, Prince Lichnowsky, Theodor Wolff of the *Tageblatt*, Sudermann, and Maximilian Harden. The results of these conversations are more personally interesting than politically instructive. M. Bourdon found abundant verbal friendship for France, and a universal conviction that Germany must increase her armaments. Adolf Kerr, of *Pan*, indulged in wholly candid expressions which have become prophetic: "There is a warlike foundation in the temperament of the race, a superfluity of animal force that requires to vent itself." What is most significant is that several of the publicists consulted volunteered the information that there was no international opinion among the German people, and that war, if it came, would be the decision of a small administrative minority. M. Bourdon's suggestion that a neutralized Alsace-Lorraine would liberate France to avert an impending clash between Germany and Russia has a pathetically belated sound. While the personal interest of a book which reports the sayings of prominent German leaders is considerable, no common tendency is discernible except that everybody felt before the war that Germany should be tremendously armed and that she would keep peace only on the condition that her whole case be conceded. The state of mind can hardly be described as enigmatic, and M. Bourdon should not have been puzzled.

John C. Powys's pamphlet, "The War and Culture" (G. Arnold Shaw) is a reply to Professor Münsterberg's book. Mr. Powys goes straight to the contrasting political ideals that underlie the war, setting them forth with clearness and eloquence. An extract will give a notion of the reasoning and style of a tract which is more weighty than many of the more pretentious treatises:

> The idea of Germany is to force upon the world, by means of an omnipotent and irresistible state-machine, a certain hard, scientific, unimaginative, and efficient culture.
>
> The idea of the Allies is to protect the individual against the state, the little nations against the empires, and the drama, color, passion, beauty, and tradition of the various races of the earth against a monotonous and murderous uniformity.

Mr. Powys is both ingenious and just in bringing apparently autocratic Russia within his general scheme. Cloudesley Brereton's little book, "Who Is Responsible?" (Putnam; 50 cents net) is both an historical analysis and a forecast. The author traces clearly the hardening of German sympathy into unbridled national egotism under Prussian miseducation, and believes that Germany must be beaten for her own sake. The argument is conducted with vigor. Mr. Brere-

ton's comment on the campaign of the peace societies deserves attention:

Unfortunately, the peace societies throughout the world appear to have made an error in tactics. They have concentrated unduly on the idea of the brotherhood of man (cosmopolitanism), and have too often ignored the vital factor of nationality.

"The War in Europe: Its Cause and Consequences" (Sully & Kleinteich; $2 net) is a rather large octavo full of statistical material of a political and military sort, with maps and tables, and, as well, numerous illustrations gleaned mostly from the current magazines and from standard encyclopædic works. There is also an historical summary and a selection from the diplomatic correspondence. The compilation has been made by the skilled hand of Dr. Rossiter Johnson, and the work seems well adapted to the needs of those who are limited to a single source of reference.

"The Railway Library" for 1913, compiled by Slason Thompson (Bureau of Railway News and Statistics), sustains its reputation as a valuable collection of interesting literature on the subject of railways, most of which appeared during the year. Forty-two articles are reprinted, and the list of authors includes the names of Theodore Roosevelt, Interstate Commerce Commissioner Meyer, Charles A. Prouty, Presidents Rea of the Pennsylvania and Elliott of the New Haven, Seth Low, and W. M. Acworth.

In "The Joyful Heart" (Houghton Mifflin Co.; $1.25 net) Mr. Robert Haven Schauffler has collected a number of essays originally printed in the *Atlantic Monthly* and elsewhere. It is a book of enthusiasms. With a slight, harmless air of proprietorship it offers enthusiasm, joy, "the brimming cup," to jaded and half-hearted humanity. "Exuberance," it cries, "is the income yielded by a wise investment of one's vitality. On this income, so long as it flows in regularly, the moderate man may live in the Land of the Joyful Heart, incased in triple steel against any arrows of outrageous fortune that happen to stray in across the frontier. Immigrants to this land . . ." the passage goes on to illustrate an exuberance in speech which is characteristic of the writer. His metaphors trip on each others' heels or are forgotten, sometimes with odd results, as in his allusion to "a crowd of unadulterated human porcupines." It might be difficult to adulterate a porcupine, even with a pair of tweezers! But to be overflowing with vitality is the main thing, to be joyously abounding in health, in spirits—in activity among metaphors and elsewhere. The really central idea, to which Mr. Schauffler returns again and again in these pages, is that happy achievement depends on bodily health; and that the bodily health worth having is not a mere lack of illness, but a positive and exultant strength to will, to do, and to enjoy. He pleads for physical training as the only sane basis for cheerful and useful living. "Such a regimen pays thousands of per cent. in yearly dividends. It allows one to live in an almost continual state of exaltation rather like that which the sprinter enjoys when, after months of flawless preparation, he hurls himself through space like some winged creature too much in love with the earth to leave it, while every drop of his tingling blood makes him conscious of endless reserves of vitality." It is out of such health, says Mr. Schauffler, that masterpieces in art have proceeded—directly from the artist, but indirectly also from those "masters by proxy" who have given him of their surplus vitality in the form of sympathy and inspiration. And there is an even more practical variety of the "master by proxy." Several times in these papers Mr. Schauffler reverts to a plea for the endowment of genius. The essay on "The Joyful Heart for Poets" seems to have rather more to do with pockets than with hearts. The argument is that we should spend a few thousands out of the millions we give for education to founding "fellowships of creative poetry," and that it would be well now and then for a "captain of industry . . . to put his hand into his pocket—if only into his watch-pocket—or adorn his last testament with a modest codicil"—in favor of some struggling young poet. Thus might vicarious glory be attained by the dullest millionaire. "Even if he finds himself quite lacking in creativeness, he can still be a silent partner of genius if he will relax his purse-strings." And if he can first catch his genius! Relaxing purse-strings is, we understand, the chief sport of millionaires, but it has its rules. What Mr. Schauffler really needs for his purpose is a captain of industry with enough of surplus vitality to enjoy investing in futures.

Students of local government have long been interested in the reputed efficiency of German city administration, but hitherto there has been a surprisingly small amount of accurate information published on the subject in English. The German statistical year books are full of data, but few of us have either the patience to burrow through them or the skill and experience which is necessary to interpret the results that these figures may disclose. Mr. W. H. Dawson, in "Municipal Life and Government in Germany" (Longmans; $3.75 net), has, for the present at least, solved some of this difficulty. He has devoted several years to a personal investigation of German municipal administration, visiting the various cities, interviewing their officials, and getting his information at first hand. The result is a book, not written from books, but out of the mouths of men. This is not to say that the author has altogether neglected to make use of official publications; on the contrary, he has drawn freely from such sources. But he has put flesh upon these dry bones, so that his narrative of German municipal achievement is interesting as well as accurate in its details. The volume deals with the structure as well as with the functions of city government in the German Empire, although chiefly with the latter. There are good chapters on urban land-policy and city planning, housing, and poor relief. Due consideration is given, and very properly, to German municipal progress in minor fields of social betterment—to the municipalization of pawnshops and employment agencies, for example. More than a hundred pages are devoted to the complicated but highly important topic of municipal finances. The author's chapters on this subject constitute the clearest and most trustworthy short survey that has yet appeared in English. Some of Mr. Dawson's statements are hardly supported by the evidence adduced, but these do not seriously impair the value of a solid, careful, and readable volume. More to the point is the fact that the author has viewed everything from an intensely pro-German standpoint. He finds virtually nothing to criticise; even the Prussian local franchise system, with all its absurdities, meets his general approval as "asserting the principle of proportional representation according to liability to taxation" (p. 69).

The Abbé N. de Montfaucon de Villars, a not very godly cleric who flourished in the third quarter of the seventeenth century, published at Paris in 1670 a curious book called "Comte de Gabalis, ou entretiens sur les sciences secrètes." To the mere eye of sense, the gist of this work appears to be a somewhat playful recommendation of that "higher sensuality" which earlier in the century found favor at the court of Henrietta Maria in England under the name of "Platonic love"—a sensuality refined by mystical nonsense collected from the ends of the earth. Alexander Pope brought the book to the attention of English readers by borrowing from it the sylph-machinery in his "Rape of the Lock," and by commending it in his preface to that poem as the best account of the Rosicrucians. Edward Gibbon, as we are informed, once owned the copy now in the British Museum. Robert Browning also had a copy, to which he was indebted for some of the obscurities in "The Ring and the Book." Bulwer-Lytton utilized it in his novel, "Zanoni." Anatole France refers to it, employs it, and exposes its mystical sensuality to derisive laughter in the "Rôtisserie de la reine Pédauque." It is now presented to us in an English translation with an elaborate mystical commentary, published by the Brothers, and to be had of Mr. Harry B. Haines, 527 West 110th Street, New York, for $2.50. It is necessary, therefore, to add that to the illuminated eye—to the spiritual vision in which the writer of this note is regrettably deficient—"Comte de Gaballs" unfolds all the ancient mysteries, and leads the "Pilgrim Soul" into "a new realization of God's Omnipotence and Justice." A similar claim, we believe, was formerly advanced in behalf of Ovid's "Ars amatoria." Whether there is any relation between the Abbé's text and the commentary drawn from Plato, Proclus, Porphyry, the Koran, the Cabala, Behmen, Swedenborg, and Mrs. M. B. Eddy—this is a question which cannot be answered by one who is animated by "selfish intellectualism." As we are fairly warned at the outset, this book is only "for the student who seeks to illuminate his intelligence by the torch of his own divinity"—for those who, as Pope put it, "quitting sense call imitating God."

Norman B. Dearle, in his "Industrial Training" (London: King; 10s. 6d. net), has given us a volume well up to the standard of previous monographs edited by the Hon. W. Pember Reeves and published under the auspices of the London School of Economics and Political Science. It is a very thorough discussion of the existing conditions of employment of male workers in the City of London and how they have affected the industrial training of boys. This discussion, with its conclusions, is based upon several years of investigation during which the facts were obtained at first hand from employers, trade-union officials, trade schools, boys engaged in various methods of learning a trade, and journeymen in the same trades. Whether they agree with the author's conclusions or

not, social workers and economists owe him a debt for the completeness of the data and the logical sequence and clarity with which they are presented. Each chapter is prefaced with a summary of its contents, and by frequent recapitulation the important divisions of the subject are kept in mind. Teaching methods in the shops are treated in detail, and the advantages and disadvantages of all existing practices considered. Trade schools, the problems arising from boy labor, and the relation of industrial training to unemployment, all find their place in the book. Mr. Dearle's solution is the practical one of utilizing existing agencies so far as they are good, in the attempt to organize boy labor, standardize and improve methods in the various trades, and supplement them by universal compulsory continuation schools. Each trade would preserve what is best in its own methods, and the desired result of centralized control over the entire field of industrial training, with equal coöperation of employers, parents, trade unions, educational authorities, and other existing agencies might ultimately be achieved without sudden and violent disturbances. This book is worthy of the attention of Americans who are working along similar lines and who desire to forestall in America conditions that have become acute elsewhere..

"A Far Journey" (Houghton Mifflin; $1.75), by the Rev. Abraham Mitrie Rihbany, is a simply written story of the pathway, geographical, political, intellectual, and religious, by which the author has been led from boyhood in a Syrian village near Mt. Lebanon to a high level of intelligent citizenship in the United States, and from membership in the Greek Orthodox Church to the pastorate of the Church of the Disciples in Boston. The introductory chapters go beyond the personal fortunes of the writer and give many interesting pictures of Syrian manners and customs. That even a little Syrian village can send a child into the world with an adequate native intellectual endowment is evident from the comparative ease with which Mr. Rihbany has triumphed over the disadvantage of limited educational opportunities. Thwarted in his desire for a thorough college training, he has persistently sought and found an education elsewhere, and that, too, without falling into the common error of undervaluing the more formal schooling denied to him. His wholesome respect for American democracy, his clear conception of its nature, and his conscientious acceptance of its responsibilities should teach a lesson to those among us who would apply wholesale restrictions to the immigration through which new and vigorous blood of so desirable a type is obtained. It was the chance of a good-natured inspector rather than the strict application of existing law that saved him from deportation without seeing more of America than is visible from New York harbor, for only a hasty loan from some of his fellow passengers saved him from facing the ordeal of Ellis Island with no visible means of support.

Whatever Mr. David Hannay writes is well worth reading, for he is saturated with his subject, and he writes with authority. His latest book, "Naval Courts-Martial" (Putnam; $2.50), is not at all what one might reasonably expect, a compendium of famous trials. These he passes over in silence or with but scant reference. American readers will naturally look, but look in vain, for accounts of the court-martial held on board H. M. S. Daphne, Sheerness, March 10, 1780, "for the trial of Captains Pearson and Piercy, officers, and men of H. M. S. ships Serapis and Countess of Scarborough"; or of that held September 9, 1814, on board H. M. S. Gladiator, Portsmouth, "for the trial of the officers and crew of H. M. late squadron on Lake Erie," etc., etc. Mr. Hannay's object is far different. Out of the countless musty records he has searched he seeks to create a truthful picture of the interior economy of the Royal Navy prior to the end of the Napoleonic wars. It is the seamy, not to say repulsive, side of the warp he holds up, more than justifying the most sordid pages of Smollett and Ward. A little light breaks through the dark cloud now and then, but one marvels that such brutality, hardship, injustice, as he depicts could ever have been tolerated. Some slight description might well have been given for the benefit of the layman of the Judgments of Oleron of the fourteenth century, so long the law of the maritime world in western Europe. The index is sadly insufficient. The style is clear and admirable, and the work an absorbingly interesting human document.

Great writers have much to answer for. Had Stevenson never written his "Tour with a Donkey in the Cevennes," it is safe to say that H. H. Bashford's "Vagabonds in Perigord" (Houghton Mifflin; $1.25 net), and a hundred other books like it, would never have seen the light; and they would not have been seriously missed. Mr. Bashford's contribution to the list is quite innocuous. It tells how he and a lady and another gentleman went for a walking tour in the neighborhood of Rocamadour and what they saw —not very much of that—and especially what they felt and the things they said to one another about babies and prudery and women's rights and things like that. They do not seem to have bored one another at all, but the reader would have preferred a little more, say, about Rocamadour, and a little less about Sophronia and her babies. Stevenson knew how to make Modestine live; Mr. Bashford is less successful with Sophronia.

A "source-book" is Hugh Gordon Miller's and Joseph C. Freehoff's characterization of their book, "The Panama Canal Tolls Controversy" (Boston: Chapple). It is a source-book by virtue not only of its appendices, which contain the Clayton-Bulwer Treaty, the Suez Canal Convention, the Hay-Pauncefote treaties of 1900 and 1901, and the treaty with Panama, but also of its free utilization of speeches by Senators who had a part in the framing of some of these arrangements. The authors do not conceal their opinion that the exemption clause of the Canal Act should have been repealed, as President Wilson successfully insisted, but the mass of their pages is filled with quotations from the debates on the various aspects of the question. These are connected with brief explanatory narratives, beginning with our interest in the idea of such a canal nearly a century ago. The book is not benefited by the introductions by William J. Bryan, Oscar S. Straus, and Senator Hughes, which merely delay a reader in getting to the essentials of the matter. On the other side of the question is Lewis Nixon's "The Canal Tolls and American Shipping" (McBride, Nast; $1.25 net). Mr. Nixon's book contains even more in the way of documents than does the other volume. It pays special attention to Senator Root's speech of January 21, 1913, the admitted force of which it endeavors to break.

A sermon preached on the occasion of the fiftieth anniversary of the incorporation of Springfield, Mass., gives its name to a collection of chapters on "Civic Righteousness and Civic Pride," by Dr. Newton Marshall Hall (Sherman, French; $1.25 net). While the sermonic tone pervades the book, it embodies the ideals, economic and moral, of our present municipal strivings. Of a very different kind is "Open-Air Politics," by "Junius Jay" (Houghton Mifflin; $1.25 net), in which are set forth, in fictional form, discussions of the problem of government. It cannot be said that much light is thrown upon fundamental questions, such as that of sovereignty, nor that the breaking of the "universal strike" by the belated firmness of Gov. Soothem goes further towards a solution of our difficulties than to emphasize the necessity of law and order. The publishers' assurance that the efforts to conceal the authorship of the book have been so successful that they themselves know only that the writer is an American, "eminent in public life, and of more than national fame," is calculated to raise the expectations of the reader considerably beyond any satisfaction that the pages afford.

NOTES FROM ABROAD.

The Authors' Society of London has raised a special fund for the assistance of British writers who have suffered financially through the war. Its War Emergency Fund subcommittee has been meeting regularly once a week to consider applications, and has spent about $1,000 in relief. The list of applicants is steadily increasing, as the prolongation of the war makes further inroads upon the scanty savings of peaceful times.

H. G. Wells is not only an epigrammatist himself, but the cause of epigrams in others. An irreverent English journalist remarked lately that he almost hoped for an invasion, because Mr. Wells would then be able to carry out his intention of sniping at the Germans. In that event this would become the War that Ends Wells, and All's well that ends Wells.

At Bengasi, in that part of the new Italian colony of Tripoli which is known as Cyrenaica, an archæological museum is under formation. Professor Ghislanzoni, the director, is already busy with valuable finds which have been made, This region of the Pentapolis was in full artistic development when Herodotus visited it. Even this was long after the initial contact with Greek civilization and all that went before.

> Some grave Tyrian trader, from the sea,
> Descried at sunrise an emerging prow
> And saw the merry Grecian coaster come,
> Freighted with amber grapes, and Chian wine,
> Green bursting figs, and tunnies steeped in brine;
> And knew the intruders on his ancient home,
> The young light-hearted masters of the waves.

So far excavations have been carried on at the site of Cyrene; and they have already given prime samples of classic Greek sculpture—a Venus, Discobolus, and Three Graces.

The present stop in excavating has been put to profit in classifying scattered remains. This has led to an interesting surprise. It has been possible to reconstruct almost entirely a Parian marble statue of Alexander the Great. The pieces were found, like the other statues, near the spring of Apollo. They are in excellent preservation, and make a statue more than seven and a half feet high (2.30 metres). It is a nude, vigorous figure, standing upright with an equestrian emblem at the side. The arms are still wanting. The face is full of majesty, and may be compared with the contemporary bust known as Alexander the Great in the Louvre Museum. The Cyrenean Venus is set down, in the somewhat curious inventory of Bengasi, at 250,000 lire; this Alexander is listed at 400,000 ($80,000). Art, archæology, and history are all interested.

HAPPY HUNTING GROUNDS.

Wild Game in Zambezia. By R. C. F. Maugham. New York: Charles Scribner's Sons.

In an earlier volume the author has treated in a general way of the great region in Southeast Africa drained by the Zambezi. Here he presents an account of the magnificent fauna of the same country. He has a new field, far removed from the well-known hunting grounds to the north, of the game of which Roosevelt has recently given an excellent résumé.

After a brief survey of the subject, we find in successive chapters exceedingly interesting accounts of the various forms of life, from elephants to lizards. By far the major portion is devoted to the larger game animals. Part of this is of necessity compilation, but much of it is from original observation. Although written by a sportsman primarily for sportsmen, yet the hunting aspect is subordinated and advice as to equipment and rifles is segregated in a single chapter. We are introduced to the animals of the wilderness through an easy, descriptive style of diction, rare in works of this character. The text is clarified for the layman by the absence of scientific names and technical classification. Yet the matter is in no sense unscientific, and many thoughtlessly accepted statements, as well as moot questions, are touched upon, supported with data which orient anew our previously formed opinions. Among these are the reputed manelessness of lions in thorny country and the general belief that man-eaters are such because of advancing age and failing powers of offence in tooth and claw.

The details of the wild lives as far as mankind has been able to unravel them are varied with unusual sidelights, either tragic or comic, from our anthropomorphic point of view. The former is the dominant note in the account of the magnificent, full-maned lion discovered quite dead, twenty feet from the ground, wedged in the angle of a massive fork of a tree. Judging from the surrounding indications, "it was clearly a case in which this animal had aroused the resentment of a female elephant, which had evidently seized him in her trunk in a paroxysm of rage and hurled him into the position in which he was found, whence it had been impossible to extricate himself. Both flanks were almost denuded of coat, showing the frightful struggles he must have made to escape; but the trees or the branches held firmly, and who among the cowering denizens of the jungle should obey such a call for help as that?"

Then, again, there is that which, except to Alice, must be accounted truly humorous—the vision of a lion sitting patiently for hours with gigantic paw expectantly poised at the hole of a field-rat, as he is compelled to do when larger prey is scarce, and before he resorts to the leonine diet of lowest caste—the fruits of the forest. Unless, indeed, we reserve for this place the instance of one of these kings of beasts which, famine-driven, appeased the "pangs of an unpleasant vacuum with the malodorous shirt of a long-unwashed native."

Baboons are of unusual interest, and the author's every word concerning these dreaded creatures is absorbing. The following paragraph presents his views on the relations of these primates with the natives. When a troop of baboons decides to descend upon cultivated gardens—

On approaching the scene of the raid, the troop takes open order, so to speak, the females, with their babies clinging round their necks, or with those of slightly riper growth following behind, advancing directly but noiselessly upon the scene of the robbery, while several of the "old men" take up positions, by either climbing trees or getting upon an adjacent rock or ant-hill, which enable them to observe and signal the approach of danger. This they do by the utterance of a gruff bark, whereupon, snatching all they can lay their hands upon, and with cheek-pouches stuffed to their utmost capacity, they tear away, uttering the curious "glazier's diamond" sound to which I have referred above. Should the interruption be caused by the appearance of one or two women, however, they will frequently turn *en bande,* literally mob them, and usually put them to flight, promptly appropriating anything of an edible character which they have been carrying at the time. There can be no doubt whatsoever that baboons discriminate readily between the males and the females of the human species, and are fully alive to the ease with which, in comparison with the former, the latter may be stampeded and driven off. It is incontestable that native women hold baboons in the strongest detestation and terror, and various scarcely credible stories are related of the boldness of these animals when women have been reduced through fear to helplessness. Personally, I incline strongly to the view that the baboon's one object in demonstrating before native women is to possess himself less of the affrighted female than of any small articles of an edible character she may have in her possession at the time, and I have never heard an authenticated case of the animal having occasioned her further cause for reproach, if one except a severe fright into the bargain. Still, however improbable the belief in the designs which baboons are said to have upon native women and girls, it has gained such ground as to have obtained practically universal belief.

Two notable chapters at the end deal with the tsetse fly and game reserves. In the former the author presents a strong case against the threatened wholesale and deliberate destruction of wild game as the suspected sole source of food of these terrible pests, and seems to show conclusively that there are extensive fly-belts from which the larger game animals are wholly absent. Throughout the volume there is frequent protest against "biltong" and pot hunters, together with sane pleas for the establishment of preserves.

Prof. E. E. Barnard, of the Yerkes Observatory, contributes to the *Astrophysical Journal* an account of visual observations of Halley's comet at its last return in 1910. Considering its great brightness, and the extraordinary phenomena presented by other comets of recent years, which at most only attained the faintest naked-eye visibility, Halley's comet at this return, though a brilliant and interesting object to the naked eye, was, nevertheless, a disappointment when considered from a photographic standpoint. It is safe to say that it did not give us any new information concerning these strange bodies. Photographically, its light was relatively slow in its action. While it lacked much in interest as seen with the eye of the sensitive plate, to the human eye it left a lasting impression, which, added to its long life-history of more than 2,000 years, made it, at its return of 1910, perhaps the most interesting comet of history. The apparent length of its tail when nearest the earth (120 degrees or more) was probably the greatest on record, though the actual length was much exceeded by many previous comets. With the forty-inch telescope its visual appearance extended from September 15, 1909, to May 23, 1911, which, though a long period, has been exceeded by several comets that never attained naked-eye visibility. It seems quite probable that the earth actually did encounter one of the branches of the tail—the southern branch—on, or about, May 18 or 19, more probably on the later date. There is also a suspicion that the influence of this encounter on our atmosphere was apparent for months afterward, as slowly moving strips and masses of self-luminous haze which were not confined to any one part of the sky.

John Muir, geologist, naturalist, and explorer, who died on December 24, was born at Dunbar, Scotland, on April 21, 1838. After an elementary education in Scotland (he went to school before he was three years of age) he came with his parents to America at an early age and settled in Wisconsin, where he shared in the hard life of a pioneer farmer. In boyhood he exhibited an extraordinary inventive gift, and this, through an exhibition of his devices at the Wisconsin State Fair in 1860, led to his attending the State University, working his way through his four years' course at college. An accident to his eye turned him definitely to the study of nature; drew him, as he himself said, "to the sweet fields rather than from them," and there followed some months of tramping which brought him finally to the "glorious Yosemite," whose spell held him for the rest of his life.

In 1876 Mr. Muir joined the United States Coast and Geodetic Survey in order to in-

crease his knowledge of the deserts and mountain ranges beyond the Sierras, and for three years he worked in Nevada and Utah; but in 1879 he returned to his studies of glaciers, which took him to Alaska, where he discovered the glacier named after him. In 1881 he went as a member of the Corwin Expedition in search of De Long and the lost Jeannette, which gave him opportunity for other glacial studies along the coast of Siberia and in the Bering Sea. He was the first to demonstrate the existence of living glaciers in the Sierra Nevada, his conclusions, when he first stated them, being laughed to scorn by the scientists. Apart from his scientific work, Mr. Muir's preëminent service to his country was in the long fight, finally crowned with success, which he made to preserve the national parks and the forest reserves. He remained faithful to the end to his beloved Sierras, but he left them at times for extensive travels, and his absorption in the study of nature took him to South America, Australia, New Zealand, India, and South Africa. Mr. Muir, besides innumerable articles in magazines and newspapers, published: "The Mountains of California," 1894; "Our National Parks," 1901; "Stickeen, the Story of a Dog," 1909; "My First Summer in the Sierra," 1911; "The Yosemite," 1912; "Story of My Boyhood and Youth," 1913. Harvard conferred on him an honorary A.M. in 1896, and he received the LL.D. from Wisconsin in 1897 and from California in 1913, and the Litt.D. from Yale in 1911.

A correspondent sends us the following:

How a steel-filing, hitting an embryo Edison in the eye, turned him suddenly into an Agassiz, is shown by the career of the late John Muir, and the incident will furnish numberless preachers with a theme for impressing upon their disciples the marvels of a Providential dispensation. But one of the things which will do most to leave the philosopher's memory sweet in the thoughts of our fun-loving age is the way he put his inventive genius to work on a small scale, to add to the comfort of his own life. Not only had he a mechanical device to wake him up in the morning at any hour he chose, and dump him out of bed, but he made another which would rid him of bores. He called it a loafer-chair. An undesirable visitor who was so willing to cut his call short that he would sit merely on the front of the chair, ready to rise and depart as soon as his business was finished, escaped any trouble; but one who was so bent on making himself at home as to lean back, by that act pressed a concealed spring which fired an old pistol directly under the seat. No one ever remained passive at that stage of the performance; and it was one of Mr. Muir's special delights to make diagrams of the kind of parabolic curves different bores would describe as they flew through the air in terror. Less amiable, perhaps, but scarcely less startling in its effects, was the apparatus he rigged up to clear his study of lovely women who called sometimes in shoals to inspect his inventions and ask questions which seemed to him superfluous. When this performance had proceeded as far as he desired, he slyly released a hair thread which brought down from the ceiling, into the midst of the gathering, a particularly horrid-looking spider, made of a raisin and some sprigs of wood. From that moment he had the room to himself.

Drama

EARLY ACADEMIC PLAYS.

The University Drama in the Tudor Age. By Frederick S. Boas. Oxford: At the Clarendon Press.

The English university drama of the sixteenth century has been slow in reaching modern scholars. Only very recently have the issues of the Malone Society and of Professor Bang's "Materialien" (suspended only temporarily, we may hope, by the dispersion of the University of Louvain) begun to make accessible material for which one had to depend on the summaries of Churchill and Keller and of Louise B. Morgan in the "Shakespeare Jahrbuch." And until Professor Boas contributed a chapter to the "Cambridge History of English Literature" nothing like a comprehensive survey of the subject had been attempted.

In the volume before us the latter end of the story is omitted; we hear nothing of King James's delight in "Ignoramus," of the rise of pastoral and the spread of allegory on the university boards; for these things and for a bibliography of the subject the reader is referred to the sixth volume of the "Cambridge History." The present account ends with the death of Elizabeth; almost, it might be said, it begins with the time of her birth (1533), so late did humanism mature in England; and her visits to Cambridge in 1564, to Oxford in 1566 and 1592, were events of capital importance in the history of academic drama. By limiting the scope of the book, more space could be devoted to the detailed discussion of points merely mentioned in the earlier article, such as the questionable identification of the extant "Absalon" with Watson's play of that name so highly praised by Ascham; John Bridge's claim to the authorship of "Gammer Gurtons Nedle," and the controversy between the Puritan Rainolds and Gager, the Christ Church dramatist, over the propriety of college plays.

But, indeed, at every point the subject gains by the detailed treatment it receives. The description "academic" is enough to relegate any play to oblivion; the fact that it is written in Latin is sufficient to insure its permanent residence there. But under the spell of Professor Boas's enthusiasm, and in the presence of his skilfully sustained analyses of the plays themselves, even the prejudiced reader might be expected to kindle. For, in truth, the academic drama of the sixteenth century touched life and letters at many points. It was closely connected with the court. Performances were "ordered" by intending royal visitors, such as those in honor of Elizabeth or of the Polish prince, Albertus Alasco, whom Leicester brought to Oxford in 1583. Nobles like Lord Buckhurst, the Revels Office, too, helped to equip these academic plays; on the occasion of Elizabeth's first visit to Oxford Richard Edwardes, Master of the Children of the Chapel Royal, not only wrote his famous and unhappily lost, "Palamon and Arcyte," but likewise had general superintendence over the whole dramatic programme.

There were close relations, too, between the academic drama and the popular stage. Lyly, Peele, Lodge, Nash, Greene, and Marlowe were all university trained men; Peele superintended the performances at Christ Church in 1583. Some news of all this dramatic activity reached Shakespeare: of Legge's triple Senecan tragedy, "Richardus Tertius," and, possibly, in "Twelfth Night," of the attractive Cambridge comedy, "Laelia." Conversely, the academic dramatist, though his models were usually Senecan tragedy and comedy Plautine, Italianate, even Aristophanic sometimes, did not always write without knowledge of the popular stage. The anonymous author of "Cæsar and Pompey," an Oxford play of about 1594, makes heavy draughts upon it, and the authors of the "Parnassus" trilogy, who despised the professional player with the perfect contempt of the gownsman, made satiric and critical fun of Shakespeare at every point.

The play last named serves as a reminder that not all the successes of the academic drama were in Latin. At about the time of Shakespeare's birth stands "Gammer Gurtons Nedle," a Cambridge play, happily uniting classical and native traditions. Among the early plays, one of the best, Christopherson's Ἰεφθάε, with its reminiscences of Euripides's "Iphigenia in Aulis," is in Greek. But Latin is the natural medium, and it is only because their achievements are in this tongue, instead of the vernacular, that men like Nicholas Grimald and William Gager do not hold an important place in the story of Tudor drama. To match the work of these Oxford tragedians, Cambridge can show comedies no less brilliant. And this in spite of the fact that the academic drama seldom forgot its practical functions, of providing instruction, in its earlier stages of a moral, in its later of a rhetorical character. Only occasionally do we come upon Aristophanic fun adapted to local conditions, such as the satiric portrait of Gabriel Harvey in "Pedantius," or the attack on the "town" in "Club Law."

Professor Boas's volume, for its combination of full detail and stimulating presentation, will at once take its place among the classics of modern scholarship.

At the Gaiety, Manchester, Miss Horniman intends, early in the New Year, to produce two plays of considerable interest. The first is "The One Thing Needful," written by Miss Estelle Burney and Mr. Herbert Swea Originally presented at an experimental performance some months ago, the piece attracted more than ordinary attention. It has since been largely revised and certain obvious defects have been removed. In its altered shape it will probably be seen later in London during Miss Horniman's spring season. From Mr. Frank Stayton Miss Horniman has also acquired a play entitled "The Joan Danvers," which is to see the light in due course.

"THE LIE."

Except to say that Henry Arthur Jones's new four-act drama, "The Lie," cannot under any circumstances be called a great play, one may well reserve downright judgment until it is produced in conditions more favorable than those attending the representation at the Harris Theatre. For one thing, the play gets a poor start in the present production. The first act is one of those leisurely sketches of English characteristics, dear to both Jones and Pinero, and somewhat resembling the spacious scenes of eighteenth-century comedy, in which much is left to the individual touches of the actors—in a word, comedy of manners. It sets forth simply and accurately the life of an aristocratic derelict, an old gentleman living on in the run-down abbey which for six hundred years has been occupied by his ancestors. He is of the amusing type to whom all modern tendencies are villanous and all reformers and new aspirants to fame and fortune are scoundrels. Here Sir Robert lives with his granddaughter, Elinore (Margaret Illington), attended by two servants who can be retained only because they cannot be paid off. Yet Sir Robert attains a modicum of comfort by recourse to wine and hunting, and though pretending to absolute independence, can see no reason why the rascals who have recently achieved prominence should not subsidize him as an admirable example of the older order.

The sketch, though done in simple colors, is quite convincing, and was fairly played by Mr. Alfred Bishop. But Miss Illington fitted poorly into the setting; at least one of the servants, the maid, was a caricature, and Mr. Vincent Serrano, in the important part of Gerald Forster, a rich young engineer, in love with Elinore, was entirely out of his element.

If this initial scene were better managed, it is quite possible that the succeeding tragedy would be more gripping than it is. For the tragedy has supreme elements. It relates a story of self-effacement on the part of Elinore, who, to shield her sister from the consequences of an irregular union, gives up for the time a chance to make a handsome marriage with Gerald. We need not explain the circumstances through which the sister Lucy (well played by Miss Violet Heming) contrives to convince Gerald, who has got wind of some irregularity, that Elinore and not she is guilty of the illegitimate child, and through which she marries Gerald herself. In the end, of course, Elinore hears of the lie and turns on Lucy ferociously, in a scene having certain similarity to one in "The Lily," so ably portrayed by Nance O'Neill. Here is dramatic material, which shines through both Miss Illington's limited abilities and Mr. Jones's inadequate treatment. For it is inadequate. In the first place, he resorts to stage tricks, such as entrances in the nick of time to prevent important disclosures. Nor is he at pains to give a rounded human picture of the younger sister, who in her unrelieved selfishness takes on much the proportions of an Elizabethan villain.

Altogether this play gives the impression of a work hastily put together; which is perhaps the most severe charge that could be brought against it. For if such aspects of sex as that here presented must continue to occupy the stage, they should be treated in such a way as to free them entirely from the suspicion of commercialism. F.

"POOR LITTLE THING."

An interesting experiment was initiated last week in the opening of the Bandbox Theatre, another of the "little theatres," but this time dedicated to the special purpose of housing a repertory company which shall produce a new play every month. For the idea of such an enterprise no praise is needed; the desirability, indeed the urgent necessity, for the best interests of drama of a revival of the repertory company is a matter on which virtually all who take an intelligent interest in the theatre are agreed. It only remains to be said that the stock company of the Bandbox seems to have been well selected, and that the principle on which the plays are to be cast is obviously sensible, but unfortunately rare: there are to be neither leading men nor leading women, but players are to be fitted to rôles, not rôles to players.

The opening of this little theatre on East 57th Street, which has been renovated attractively, but not extravagantly, may be said to have been auspicious. The piece selected was "Poor Little Thing," a new play in four acts by Jerome K. Jerome, adapted from the French of Jules Lemaître. In the adaptation it must be admitted that some of the dramatic force of the original has been lost. This was inevitable, if we accept, as Mr. Jerome does, the necessity of toning down for Anglo-Saxon audiences the essential motive of the piece, which is the rivalry of father and son for the affections of the same girl. Mr. Jerome, therefore, reconciles the play with the accepted canons of good taste by diluting the father's passion for the girl into a mixture of platonic and paternal affection, thereby eliminating some of the clash of will which makes for dramatic intensity in the original and weakening the character of the father.

Mareze, a distinguished artist, is the adored "master" of a class of gushing girls. Their adoration and his pleased acceptance of it are equally innocent, and cause no pang to his honest and somewhat stupid peasant wife, who has not been able to rise with the growing fame of her husband. But there is a gifted and favorite pupil, Juliette Dupuy, in whom Mareze takes an especial interest, which he describes to himself, as to his wife, as purely paternal. Concerning the purity of his affection, however, he protesteth, though quite sincerely, overmuch, and arouses the jealousy of his wife. The climax comes when, on meeting the girl by chance in Mareze's studio, in his own home, the wife in ungovernable passion forbids her to come there again. As the scene is in progress, the Marezes' son, Jacques, enters, and his sympathy with the girl is aroused, a sympathy which is subsequently turned to love by a series of meetings for the discussion of high art. Mareze, deprived of the society of his favorite pupil, is conscious of a void, and only realizes the significance of his feeling when his own son announces his love for Juliette, and asks the parental consent to the marriage. It is here that Mr. Jerome's version of the play is weak and indefinite. The strongest emotion that he can allow to Mareze is a pronounced disinclination to seeing Juliette the wife of anybody, and particularly of his own son. The climactic scene, in which the wife becomes convinced of the perfect innocence of Juliette, and realizes that the solution of the problem is to be found in her marriage with Jacques, is dramatic, well written, and well played, but the method by which the consent of Mareze is finally obtained, through an announcement that he has been elected to the Academy, is decidedly inconclusive.

There are weak points in the play, and the tempo of the production throughout needs quickening, but it is an interesting and amusing little piece, well written, on the whole, and well acted by the Bandbox players. Eric Blind, in the principal rôle, a difficult and onerous one, gives an exceedingly clever performance, playing the temperamental artist with a nice understanding of character, and surmounting the difficulties propounded by the adapter in the emotional scenes at the end in a manner that is highly creditable. Miss Beverley Sitgreaves, as Mme. Mareze, has an unsympathetic part, and is unsympathetic in it. William Raymond, as Jacques Mareze, gives a well considered study of a boy, fresh and enthusiastic. The performance of Juliette by Miss Janet Dunbar stands out as an excellent piece of acting. She portrays admirably, and without the least strain or overemphasis, the innocent young girl forced by circumstances into a compromising position. Minor parts are capably played, and the stage settings are good. Altogether the opening production of the Bandbox encourages hope for its future success and usefulness.

"TO-NIGHT'S THE NIGHT" AND "LADY LUXURY."

The production last week by the same management on successive nights of two musical comedies gives opportunity of comparing English and American methods in this field of light amusement. The comparison in one way is scarcely fair, since the English offering at the Shubert Theatre by the company of the Gaiety Theatre, London, starts with the advantage of a plot borrowed directly (not for the first time) from the old farce, "Pink Dominoes," which lends itself admirably to the incidental accompaniments of musical comedy. In its present incarnation it is entitled "To-night's the Night"; the book is written by Fred Thompson, and the music, which is tuneful and catchy, if of no particular originality, is by Paul A. Rubens. The American piece is Rida Johnson Young's "Lady Luxury," with pleasing music by William Schroeder, and a somewhat hackneyed and inflexible plot.

The comparison, however, is not as to which is intrinsically the better piece, for in musical comedy (as opposed to comic opera of the legitimate kind, an example of which New York has been fortunate enough to see this season in "The Lilac Domino"), that is really a minor consideration. The *ensemble* merit of these productions is to be judged by no criteria of dramatic or even of musical construction. All that is demanded is a thread of plot sufficient to give excuse for the various episodes which go to the making of the whole, and music that must be melodious and catchy, but need by no means be strikingly original. Apart, then, from the individual performances of the players, the all-important matter is the method of production. Other things being equal, the success or failure of a show of this description depends upon those who are responsible for its dressing, its lighting, its scenery, above all, the selection and rehearsing of its chorus. When we attend a musical comedy, we go, not craving intellectual stimulation, but only an agreeable satisfaction of the senses of sight and hearing, and some titillation, not too subtle, of the sense of humor. Musical comedy, in fact,

is not legitimate drama or legitimate opera, but it is perfectly legitimate entertainment.

It is in observing a high standard of production that the English method in musical comedy seems to excel the American. Opinions may differ concerning the quality of the humor provided by the English comedians in "To-night's the Night." For our own part, we like the insouciant style of George Grossmith as the Hon. Dudley Mitten, and prefer the humor which is derived from character, as this is, to that which is dependent upon situation, as is the case in "Lady Luxury." But were the humor of the two pieces transposed, the English production would still be the better on account of the tempo at which it is played, and the precision and unison of the ensemble movements. The Gaiety chorus is not only exceedingly good to look upon (a quality for which Gaiety pieces are renowned), but it knows its business thoroughly, and is trained to move with not less precision, though with infinitely more grace, than a Prussian regiment doing the goose step. Added to this is the fact that the dressing and lighting are well studied and in admirable taste, and the result is a production the success of which is achieved mainly by an infinite capacity for taking pains.

It is precisely in this last quality that nine out of ten musical comedies produced on this side of the water are deficient. The Gaiety drill and discipline should not be beyond the powers of our producers. "Lady Luxury," for instance, though not a distinguished, is by no means a bad, example of the native musical comedy, and may be taken as fairly representative. Some of the musical numbers are extremely pretty, and the comedy of Edward Van Cuyler is sufficiently amusing, but the piece places its reliance almost entirely on the attractive personality of the star, Miss Ina Claire, and that is not enough to save it from intervals of dulness or to obscure the lack of adequate care bestowed on the rehearsing of the chorus.

We have emphasized the part played by the chorus in the Gaiety production rather at the expense of the principals, but favorable mention should be made both of the talents and of the natural charm of Miss Emmy Whelen, Miss Iris Hoey, and Miss Fay Compton. Maurice Farkoa, James Blakeley, and Lauri de Frece, among the principals, also contribute not a little to the success of the piece.

S. W.

"JUST HERSELF."

The author of "Just Herself," Ethel Watts Mumford, chose a fitting title for the three-act comedy at The Playhouse, which was manifestly written arqund the personality of Lydia Lopokova. This accomplished dancer is the life of the performance, not only because of the few steps which are permitted her, but equally because of her youthful charm and her ability to act. The part which she has to fill is exacting only in the sense that it requires her to be her simple self, but even this would make too great a demand upon many an actress. Mlle. Lopokova contrives to forget the footlights and to be natural, and on the strength of her representation we venture to believe that she might safely be entrusted with other rôles. She would be notable, for instance, in "Peter Pan."

In "Just Herself," she takes the part of a girl of seventeen who has lived for twelve years at a dancing school in Germany. On her return to this country she finds her father married again, this time to his former cook's daughter, an aspiring woman to whom Euphemia's unconventional and radical ideas seem destined to thwart all social ambitions. The situation affords a chance for comedy of a rather obvious though amusing type, especially where the former cook, a woman who will tolerate no nonsense, quietly upsets some of her daughter's pretensions. In the end it is owing, of course, to Euphemia's charm that her people become intimately joined to the most fashionable of their neighbors, for there is, naturally, a "heart interest."

Perhaps the prettiest portion of this slender play is that at Euphemia's coming-out party, where she shows the artistic possibilities of the "fox trot" by putting into it the expression of her whole body.

F.

The death of Baroness Suttner has called attention to the fact that one of the last pages written by the inveterate champion of peace was an enthusiastic appreciation of Carl Hauptmann's latest play, "Krieg," with the grimly ironical sub-title "Tedeum" (Leipzig: Kurt Wolff). Although Frau von Suttner distinguished between the poet's and her own conception of war, she saw the powerful possibilities of the play as a medium of the message of peace, admitted being profoundly stirred and enriched by it, and said that she could not let the opportunity pass without publicly thanking the poet for this work.

Noble and significant as is this endorsement, the play is of a quality bound to make a deep and lasting impression under any circumstances. The suggestion of palpitating life and movement in the action, the originality of its haunting symbolism, are of a rare dramatic power. There is an element of the panoramic in the scenes themselves which seems to call for the genius of a Reinhardt or Belasco. In the first act there is a midnight congress of the world's Powers, ermine-covered bears, roosters, eagles, and other significant figures arriving in great state to convene under the presidency of "the great European mathematician," while in another part of the palace of the Minister of State is enacted a family drama, a tragic conflict between father and son. In the second act are pictured the feverish movements of a people responding to the call of the war-god, the discussions of politicians, the leave-takings of lovers, the marching of regiments to the tune of patriotic songs; but over it all hover horrible phantoms, personifying the evils that follow in the wake of war. The third act is one great orgy of bloodshed and bestiality, of life and death in savage combat, with the grewsome spectres of pestilence stalking about between the healthy and the ailing and reaping a loathsome harvest—until the figure of the great lord of war, with the traits of the Corsican, disappears in a golden charlot drawn by an enthusiastic mob, but followed by an army of skeletons in ragged uniforms that march across the stage to the tune of a dirge. The fourth act is the epilogue: palace and village are in ruins; cripples creep out from moundlike hovels that dot the once-thriving country. An aged priest is building a little temple. The sweetheart of Enoch, the son of the Minister of State, who fell in battle, comes with her new-born babe, and shows it to the pious man: "It is Enoch, my Enoch!" and the chorus of the people adds: "Enoch, the son of Cain!"

Art

ARCHITECTURE IN THE AUGUSTAN AGE

Vitruvius: The Ten Books on Architecture. Translated by Morris Hicky Morgan. Cambridge: Harvard University Press. $3.50 net.

The name of Vitruvius is familiar to all students of architecture, and to many who have but a superficial knowledge of this subject; but his writings are known to few; and this new translation of his ten books on Architecture, in attractive form, will be welcomed by many within and without the profession.

Although some doubts have been cast upon its authorship and the date of its production, the book is now generally conceded to have been written by Marcus Vitruvius Pollio during the reign of Augustus Cæsar, to whom it is dedicated. That the text has been preserved to us is without doubt due to the fact that it contains in the third, fourth, and fifth of its ten books certain rules for the proportioning of the plans, and details of design and construction of temples, and other columnar structures, which rules its author professes to have gained by study of the practice of the Greek architects and their Roman followers. The other seven books contain nothing of value to the architect; and these three indeed give us no just picture of the working methods of the real Greek and Roman architects, but rather of those of the mechanical copyist who, failing of inventive ability, seeks to reduce all design to definite formulæ. Such men live in all ages; and that they lived in Greece is evidenced by the sources from which Vitruvius drew his own rules. That they abounded in Rome is clear from the fact that Vitruvius thought it worth while to write the book before us; but this fact must not be allowed to strengthen the all too common view that no real creative architects lived among the Romans; the falsity of such a notion being shown in the ruined works they have left to us, which display a remarkable fund of imagination and inventiveness in the development of the forms inherited from Greece.

That Vitruvius himself was one of these plodding copyists seems probable from his own statements, one of which (p. 168), being of more than passing interest, may be quoted in full:

For my part, Cæsar, I have never been eager to make money by my art, but have gone on the principle that slender means and a good reputation are preferable to wealth and disrepute. For this reason, only a little celebrity has followed; but still, my hope is that, with the publication of these books, I shall become known even to posterity. And it is not to be wondered at that I am so generally unknown. Other architects go about and ask for opportunities to practice their profession; but I have been taught by my instructors that it is the proper thing to undertake a charge only after being asked, and not to ask for it; since a gentleman will blush with shame at petitioning for a thing that

arouses suspicion. It is in fact those who can grant favors that are courted, not those who receive them. What are we to think must be the suspicions of a man who is asked to allow his private means to be expended in order to please a petitioner? Must he not believe that the thing is to be done for the profit and advantage of that individual?

Little could Vitruvius in his wildest dreams have imagined that in a continent then undiscovered, and after nineteen centuries, his name would still be known. Little did he appreciate the fact that the evils he deplores in the passage just quoted were grounded in human nature, and that they would persist even to our time.

How little human nature has changed during this lapse of centuries is shown again in another instructive passage (p. 281):

> In the famous and important Greek city of Ephesus there is said to be an ancient ancestral law, the terms of which are severe, but its justice is not inequitable. When an architect accepts the charge of a public work, he has to promise what the cost of it will be. His estimate is handed to the magistrate, and his property is pledged as security until the work is done. . . .
>
> Would to God that this were also a law of the Roman people, not merely for public, but also for private buildings. For the ignorant would no longer run riot with impunity, but men who are well qualified by an exact scientific training would unquestionably adopt the profession of architecture. Gentlemen would not be misled into limitless and prodigal expenditure, even to ejectments from their estates, and the architects themselves could be forced, by fear of the penalty, to be more careful in calculating and stating the limit of expense, so that gentlemen would procure their buildings for that which they had expected, or by adding only a little more.

It has been remarked above that all but three of the ten books composing the volume are valueless to the architect; but this does not imply that they are without great worth as a human document. It is indeed most fortunate that the practical use of these three books led to the preservation of the remaining seven; for these latter give us an intensely interesting picture of Vitruvius himself, and a suggestive indication of the characteristics of the society in which he lived. He was evidently a man of high social position, for otherwise he would not have enjoyed the patronage of Augustus and of his sister, Octavia Minor. His remarks concerning himself show that he had received what at that time was a very liberal education, that he was thoroughly familiar with Greek, and was a great reader. A sidelight is thus thrown upon the nature of the training given to the men of social position in his time. It did not include any compulsory drill in the art of composition; for, as is noted in the translator's preface, the author was certainly "not a great literary personage, ambitious as he was to appear in that character." His style is turgid and pompous, and "at times his meaning is ambiguous, not because of grammatical faults, . . . but because, when he does attempt a periodic sentence, he becomes involved, and finds it difficult to extricate himself." This is sufficiently illustrated in the passages quoted above; for the translator deliberately imitated the author's peculiarities and crudities of expression, "because of his conviction that a translation should not merely reproduce the substance of a book, but should also give as clear a picture as possible of the original, of its author, and of the working of his mind."

He exhibits himself as a man of inordinate conceit who has gained from his broad reading a smattering of many branches of the learning of his day of which he makes a great display, especially in long introductions which generally deal with matters quite irrelevant to the subjects treated in the books they introduce. Men of his type are, of course, familiar to us in our time, but they are seldom able to leave a record of their conceptions and modes of thought. Here, however, we have such a record, and one that, being published under imperial patronage, may be assumed to have met with no serious disapprobation from those of the author's social position. And if such an assumption is warranted, the average "gentleman and scholar" of the Augustan era must have been an astonishingly crude thinker. His professional work naturally led him to discourse freely of engineering and building practice, and in this he shows a superficiality that is truly astonishing. It is impossible to believe that the Romans could have constructed the vast and noble works built in his day had they been dependent for direction upon architects of the type of our author. To accomplish what they did must have required great and accurate knowledge; but this, it would seem, must have been hidden from the architects, as trade secrets of the guilds.

But our author deals with many subjects far removed from his constructional interests, giving us explanations of the nature of different materials, of natural phenomena, of the activities of the body, and of the diversities of the mental and physical traits of men, all being based upon the most absurd hypotheses which cannot possibly have been entertained by the really learned men of his day.

The book is beautifully printed and appropriately illustrated. Professor Morgan died before the completion of the translation of the last four chapters of the tenth book, which was undertaken by Prof. Albert A. Howard, who also writes the preface above referred to; the whole work being prepared under the direction of Prof. H. Langford Warren.

"The Inner Life of the Royal Academy," by G. F. Leslie (Dutton, illustrated; $3.50 net), is a mine of anecdote and reminiscence. For forty-six years Mr. Leslie has been sealed of the academic tribe, and for more than twenty years earlier he had the run of the varnishing days as his father's son. It is something to have seen Turner put the final flourishes on Rain, Steam and Speed, and to tell of it well. Mr. Leslie pretty well reveals the secrets of the prison house. He tells how the schools are managed, they still have the absurdity of a new teacher every month; how the pictures are judged and hung, about the family sociabilities of varnishing day, and the greater state of Royal views and Academy dinners. The conduct of the Chantrey bequest is defended. The precious possessions of the Academy are enumerated, but without mention of the lovely cartoon of St. Anne by Leonardo. It is, after all, not being an oil painting, a minor affair from the academic point of view. Generally speaking, one has rather the sense of being among jolly people than among great artists as one runs over the pages, and of course such is the case. Mr. Leslie has a shrewd sense for a good quip or an anecdote, but not much vividness as a characterizer. Yet there is something graphic enough in the hint of Leighton's olympian if always genial aloofness. It was Leighton, according to Mr. Leslie, who introduced an unhappy Continental strain into the pure British tradition. Thus the old, beloved, free-selling picture with a story was discredited, to the detriment of the British artist and public. One is agreeably surprised to read of Gérôme that (before Whistler had discovered London) "he astonished us by expressing his admiration for the foggy gloom of the London streets, he wondered why we did not introduce it into our paintings." Very interesting is the description of Turner's carrying his canvases to exhibition pitch on varnishing day. He kept a supply of faintly painted and fully dried canvases ready. These had a "delicate effect, almost in monochrome, and very beautiful they looked, often like milky ghosts." These, once hung, he proceeded to bedevil with the brightest and most treacherous colors in his tubes. Such eleventh-hour painting, in Mr. Leslie's opinion, has spoiled and changed. All the exhibited canvases are wrecks, and might as well be thrown away. The remarkable pictures lately put into the Tate Gallery are of a different sort. "The safest and simplest pigments alone were used. If I am right in my conjecture, we ought to be thankful that they never were exhibited, for, if this had been the case, they would, most likely, have by this time been ruined by the deleterious pigments with which he would have overlaid them on the varnishing days." Such a view helps to explain the dismay that many a reader of "Modern Painters" has felt on entering the Turner Room in the National Gallery. Many such tidbits may be gleaned from Mr. Leslie's reminiscences, which may be enjoyed even by those who do not wholly share his confidence in the best possible Academy in the best possible world.

"British Painters, their Story and their Art," by J. Edgcumbe Staley (Stokes; $1.75 net), is an odd combination of a catalogue and a sustained rhapsody. All British artists look alike good to the author. Analogies fly to his pen. Hogarth's Shrimp Girl is the English Mona Lisa. This constant unmodulated outpouring of professional enthusiasm grows very tiresome in the end, and it is hardly redeemed by the two dozen color plates of mediocre execution which the text enshrines.

In "The Study of Modern Painting" (The Century Co., $2 net, illustrated), Margaret Steele Anderson makes a rapid survey of the art in Europe and America, and arrives at the conclusion that a decorative-idyllic tendency is the modern note. The chapters are clearly written and judicious, but the whole

thing makes the impression of a result not attained vividly before pictures but excerpted and paraphrased from books. Only some such process would seem to account for the following observations on Brangwyn: "Brangwyn has been likened to Mantegna, but the likeness is only occasional. He is certainly descended from Venice, however, with something of the splendid Turner. He has little of the effect of the pallid Chavannes, though evidently learning from that innovator," etc. It is fair to add that the book is better than so sapient an extract would indicate, and that it may be helpful to those whose ill-assorted information and admirations need a very elementary putting in order.

"An Idler in Spain, the Record of a Goya Pilgrimage" (McBride, Nast; $2 net), by J. E. Crawford Flitch, deals as much with Spain as with Goya. Mr. Flitch is a capital traveller of the enthusiastic and impressionable type, and whether he discusses morning coffee at Barcelona, the soul of Goya's Zaragoza, or particular pictures, is always entertaining. Much good criticism is interwoven, and perhaps rather lost, in the general whimsicality. It would be hard to hit off the diabolism of Goya more briefly than this: "The violent and the tragic fascinated him because in violence and tragedy life is usually raised to a higher power." In a pretty careful description of the religious wall paintings which, sadly restored, still remain in the Carthusian Aula Dei, near Zaragoza, Mr. Flitch makes a distinct contribution. It is the first consistent account of early works that had become nearly legendary. His defence of the more than secular decorations of San Antonio de la Florida is more specious than convincing. The book is always stimulating, perhaps just a little over-vivacious, as is natural in an avowed devotee of Hilaire Belloc. It will be read with interest by lovers of idiomatic Spain. There are eight illustrations after Goya.

Finance

THE PAST FINANCIAL YEAR.

In the last two weeks of last January, there occurred on the markets a movement so emphatic in its character, and so world-wide in its scope, as to lead in many quarters to the inference that an unmistakable drift of financial affairs in 1914 towards great prosperity was being indicated. It began in Europe, where the bank rates, long kept at high figures because of uneasiness as to international relations after the Balkan War, were reduced in a way almost sensational. These reductions occurred at London, Berlin, Paris, Brussels, Austria, Sweden, Norway, and Switzerland. Some of the banks made two or three reductions. All of them went to the lowest rates established since the Balkan states, in the autumn of 1912, invaded Turkey. And along with this world-wide expression of confidenee at the banks, the stock markets rose violently. German Government bonds advanced 4 points, British consols 8¼, Freneh rentes 2, Austrian bonds 2½. Other stocks at Berlin, Paris, and London moved up even more rapidly. On the New York Stock Exehange, with the largest trading in two years, prices rose 6 to 11 points. Wall Street ealled it "the first bull market since the panic."

To this day, nobody knows exactly what it was that caused so sudden (and so short-lived) a burst of financial confidence as that of the first five weeks of 1914. Neither the "White Paper" nor the "Yellow Paper" nor the "Orange Paper" gives the slightest hint of any sudden turn to diplomatic optimism at that time. Yet, if the storm-clouds of European war had actually blown away, it is not at all improbable that the enthusiastic January rise on the New York Stock Exchange would have been pointed out, at this present time, as the correct harbinger of financial conditions, in the United States at any rate, during the rest of 1914.

When one now takes account of stock as to the year's actual results in financial Amerieа—if one can disregard the war and its influences, and measure other achievements as they would have been measured in an ordinary year—the story is rather impressive. A wheat crop in the United States larger by 127,600,000 bushels than the previous high-record crop of the year before, and coming when the rest of the world's production was 361,600,000 bushels less than in 1913. A cotton crop probably surpassing all precedent. A harvest of other grains than wheat 274,000,000 bushels above last year. A new banking system introduced in the United States, which automatically released some $300,000,000 of reserve money.

And as a condition precedent to these numerous notable contributions to reviving prosperity, there was the policy, long pursued on the Stock Exchange, in our producing industries, in the providing of stocks of goods on merchants' shelves, and in the conducting of general business—a policy characterized by strict economy, conservative values, close margin of supplies, and total absence of speculation. It would not require a very bold stretch of fancy to imagine—if the German Government had chosen to stop Austria from throwing her torch into the powder-barrel—an autumn of great American prosperity.

After the interval of financial nightmare, since that January demonstration, we are just now beginning to understand what was the meaning of all these underlying conditions of 1914 in the United States itself, even with the world's financial and commercial relations shattered by the European catastrophe. That the year should be ending with the American Stoek Exchange the first of all the world to open for free trading; with prices, in spite of reaction from their highest level, holding above the closing quotations of July 30; with money easy, after all our huge gold shipments to meet Europe's abnormal requisitions on us, and yet with the foreign exehanges moving emphatieally in favor of this eountry—all this, in its way, is quite as strong testimony to the intrinsie strength of the American position as was the demonstration on the stock market last January.

If there had been no war, and no perpetual threat of war, it is probable that a review of the governing influences of 1914 in American finance would be made up of the year's extraordinary agricultural good fortune, of the new demand which had sprung up in every manufacturing industry in the autumn, of the great expansion in our export trade, recovery on the investment markets, and of the general movement of prosperity. As it is, the year's financial history in this country will undoubtedly be remembered for the firmness and decision with which the shock of the European war was met, the straightforwardness with whieh we settled the foreign indebtedness that suddenly called for payment, and the immediate diseovery of the extent to which Europe had to depend on the United States for its materials and necessaries of life.

As to whether, without the outbreak of European war at the opening of August, we should have had an autumn of really great financial and industrial revival—on that point, opinions will doubtless always differ. The materials were present; but they were also present in the autumn of 1913, when every favorable material influence was superseded by the apprehensions of coming war. This leaves the question open, whether the events of August were or were not the inevitable sequel to the events of 1911 and 1913, and whether the avoiding of war in 1914 would merely have meant postponement, with financial misgiving and agitation continued until the day of reckoning should arrive. Historians will debate that question from now to the end of time; for, in the nature of the case, it is a question to which no conclusive answer will ever be possible.

A New History of The United States

IN THE HOME UNIVERSITY LIBRARY

The Colonial Period (1607-1766)

By CHARLES McLEAN ANDREWS, Professor of American History, Yale.

"The most scholarly book of its size in this field and a definite contribution to the literature of the period. Will enrich the library of every teacher of American history."—WAYLAND J. CHASE, *History Teachers' Magazine.*

The Wars Between England and America (1763-1815)

By THEODORE C. SMITH, Professor of American History, Williams College.

"The history of this period, political and diplomatic and not merely military. One of the most interesting volumes. The distinction and charm of the volume are its following of the developments at Westminster, along with those in the Colonies or States."—*The Nation.*

From Jefferson to Lincoln (1815-1860)

By WILLIAM MacDONALD, Professor of History, Brown.

"Its many admirable qualities will certainly win for it a hearty welcome."—*Amer. Historical Review.*

The Civil War (1854-1865)

By FREDERIC L. PAXSON, Professor of American History, Wisconsin.

"The best brief account of the Civil War."—*Independent.*

Reconstruction and Union (1865-1912)

By PAUL LELAND HAWORTH

A History of the United States in our own times.

"Has performed with skill the dangerous feat of making our recent political history interesting."—*Bookman.*

Cloth bound, good paper, clear type, 256 pages per volume, bibliographies, indices, also maps or illustrations where needed. Each complete and sold separately. **50c.** per volume

HENRY HOLT AND COMPANY 34 West 33d St. NEW YORK

Studies in History, Economics and Public Law

250,000 copies sold of the advance chapter

The Evidence in the Case

By JAMES M. BECK

Late Assistant Attorney-General

200 pages, 12mo, cloth, net $1.00. *By mail* $1.10

A book which gives the clearest and most satisfactory account of the events which led up to the war. It is based on a thorough investigation of the official reports. This volume, which presents the revised text of Mr. Beck's original article in The Times, "In the Supreme Court of Civilization," contains a number of additional chapters, and includes a discussion of the personal responsibility of the Kaiser.

A diplomatic authority writes:

"No better work has been published on the mighty problems that the war has involved."

A former Secretary of State says:

"The most able and comprehensive of the many papers that have been produced in connection with the issues of this terrible war. * * * You have placed the world under great obligations."

THE ALGEBRA OF LOGIC

By LOUIS COUTURAT

Authorized translation by LYDIA G. ROBINSON, with preface by PHILIP E. B. JOURDAIN. Pp. 41, 8vo; cloth. An introduction to the study of mathematical logic. Price, $1.50.

One of the simplest and most concise treatments of the subject of symbolic logic. The preface is of an historical character and gives a very thorough account of the development of the subject and the various phases of it, especially emphasized by each of its different representatives.

THE EAST I KNOW

By PAUL CLAUDEL

Translated by Teresa Frances and William Rose Benet

No less a critic than William S. Braithwaite lists this book at the head of the "Ten Best Books of Poetry for 1914," describing it as: "A volume of prose poems by one of the greatest poets living in the world to-day. Although Paul Claudel is unknown to English readers, his influence is the strongest shaping force there is on the young poetry of most European countries. I know of no living writer of whom we may more confidently predict immortality for his work. If any reader can set down this volume without realizing that a great new force in literature and life has been born into the world, he is incapable of imaginative appreciation."

The book is well suited for use as a gift.
